Engadine' (*Encò d' Oen*), a valley in the E. of the canton of Grisons (Graubünden), Switzerland, is watered by the Inn, and has a length of 43 miles. It extends in a north-easterly direction between the Lepontian and Rhætian Alps, and is divided into the Lower E. in the N., an inclement ravine, clad with cembra pines, and the Upper E. in the S., a smiling meadow-land 4000 feet above the sea. The chief places in the former are Zernez and Tarasp: in the latter, Silvaplana, St. Moritz (a sanatorium), Samaden, &c. The Engadines are of Latin origin, and speak a Romanic tongue (*Ladin*). They usually pass a portion of their lives in the large European towns, chiefly as hawkers and confectioners, invariably returning to their native valley.

Engage'ments, Military and Naval, are hostile encounters between armies and fleets or divisions of these. The nature of these conflicts has been continually changing. The primitive manœuvres were upset by the invention of gunpowder, and warfare has in recent years been again revolutionised by the stricter study of tactics, by the introduction of armoured and ramming steamships, by the use of torpedoes, and by the vast improvements in cannon and small arms. See DRILL (MILITARY), ÉCHELON, CAMP, &c.

Enghien', Louis Antoine Henri de Bourbon, Duc d', son of Prince Henri Louis Joseph, Duc de Bourbon, was born at Chantilly, 2nd August, 1772. He fought with the French Royalists against the Republicans, 1796-99, and after the peace of Luneville, having a pension from England, retired to the château of Ettenheim, in Baden, and was privately married to the Princess Charlotte de Rohan. On the 17th of March, 1804, a French force entered the Baden territory, seized E. in bed, and took him to the Castle of Vincennes near Paris, where he was tried by a military court on the charge of being privy to the plot of Pichegru against the life of Napoleon, and having been convicted without evidence, was by order of Napoleon shot in the castle ditch on the 21st of March. Fouché, Napoleon's chief adviser, said of the execution of E. that 'it was worse than a crime, it was a blunder'; Napoleon defended it on the ground that it was necessary to frighten the Bourbons. See Dupin's records of the trial, and Savary's memoir *Sur la Catastrophe de M. le Duc d'E.* (Par. 1823).

En′gine (Lat. *ingenium*, 'natural capacity,' 'invention'; Ital. *ingegno*; Fr. *engin*, 'craft,' 'contrivance'), a term in mechanics, applied in a general sense to any powerful machine, but strictly denoting prime movers. Engines are usually more fully designated in accordance with their special functions, as in the case of a Steam-E. (q.v.). The forces applied and utilised by the various engines are heat, gravity, and electricity. The relation of these forces to useful work is described under THERMO-DYNAMICS, HYDRO-DYNAMICS, ENERGY, &c.

Engineer′ and **Engineering′.** The Institution of Civil Engineers defines E. as 'the art of directing the great sources of power in nature for the use and convenience of man,' and as dealing with 'the construction of roads, bridges, aqueducts, canals, river navigation, and docks for internal intercourse and exchange,' &c. In the widest sense, the E., to use the words of the late Professor Macquorn Rankine, 'is he who makes the mechanical properties of matter serve the ends of man.'

The business of the *military* E. (in distinction from whom others received the title *civil*) is to construct fortifications and military roads and works generally. In India, however, much purely civil work—the construction of railways, canals, bridges, &c.—is still done by military engineers, and throughout the Empire the work of the Ordnance Survey is carried on by them.

The profession of the Civil E. (q.v.) is further subdivided into railway engineers, hydraulic engineers, telegraphic engineers, electrical engineers, mining engineers, &c. The civil E., generally only designs and superintends work; the actual making of the railways, bridges, docks, &c., under his care is done by a *contractor*. The mechanical E., on the other hand, usually constructs as well as designs his work. He employs his own workmen—pattern-makers, moulders, smiths, fitters, turners, &c.

The English still hold the foremost position as engineers, in spite of the greatly superior education received by those of Germany and France. England, however, is now rapidly extending the provision for efficient training. Although she has nothing exactly corresponding to the German Polytechnic Schools, most of the universities and colleges have at last been won over to move with the times and have established chairs of engineering. The E. requires a knowledge of pure mathematics, mechanics, hydrostatics, hydraulics, dynamics, optics, electricity, and drawing. The various operations of the art are treated of in separate articles.

Engineers in the royal navy rank as commissioned officers. They are admitted by examination, and have charge of and control over the engines, boilers, and machinery in general of vessels of war. The principal classes into which they are divided are inspectors of machinery, chief E., and assistant E., the latter being subdivided into first, second, and third class. The pay ranges from £110 to £639.

Engineers, Royal, a regiment or corps of the British army, the special duties of which are the defence, attack, and alteration of fortified places, and making or destroying roads, bridges, &c. The regiment was first incorporated in 1763, the department of military engineering having previously to that date been superintended by officers selected from the army. The distinction of being made a royal corps, with a distinctive uniform, was conferred in 1783. In the army estimates for 1894-95 the corps of R. E. consisted of 588 officers, 1222 non-commissioned officers, and 5413 men. Officers of the R. E. require to possess a liberal knowledge of mathematics, mechanics, the theory and practice of construction, and drawing, &c. They enter as cadets, by competition, into the Royal Military Academy, where a course in these branches is pursued, and whence they pass out with commissions. The non-commissioned officers and privates are all skilled workmen in some mechanical calling. The pay of officers and men is considerably higher than in line regiments; and as the Ordnance Survey has been entrusted to the corps, as well as various special Government works, unusual facilities are afforded for advancement. The corps consists of 1-42 companies stationed at various places throughout the empire, A-N (except H) companies stationed at Chatham, H company in India, and Telegraph battalion at Aldershot and London, besides Bridging battalion, Mounted Detachment, Field Depot for R. E. Troops, Balloon Depot and Section, all stationed at Aldershot. At the present time the Duke of Cambridge is Colonel of the corps. Besides the R. E., there are the Coast battalion of the Submarine Miners, two regiments of Militia Engineers, ten divisions of Militia Submarine Miners, twenty battalions of Volunteer Engineers, seven divisions of Volunteer Submarine Miners, and one Volunteer Engineer and Railway Transport Corps.

Eng′land and Wales, the southern and larger portion of the island of Great Britain, is bounded N. by Scotland, E. by the North Sea, S. by the English Channel, and W. by the Atlantic and the Irish Sea, and lies in lat. 49° 51′-55° 45′ N. and long. 1° 45′-5° 44′ W. The country is somewhat in the form of a scalene triangle, having its base in the S., while its extreme points are in the N. Berwick, S. the Lizard Point, E. Lowestoft Ness in Suffolk, and W. Land's End. Its extreme length, from Tweedmouth in the N. to St. Alban's Head in Dorset, is 365 miles; and its breadth, from Hartland Point in Devon to the S. Foreland in Kent, is 290, while the extent of the coast-line amounts to 2000 miles, giving 1 mile of sea-margin to every 29 sq. miles of surface.

The chief indentations on the W. side are the Solway, Morecambe Bay, Cardigan Bay, St. Bride's Bay, Milford Haven, and Bristol Channel; on the S. Mount's Bay, Plymouth Sound, Portsmouth Harbour, and Southampton Water; and on the E. the estuary of the Thames, the Wash, and the Humber. Of the capes may be mentioned, on the E. coast, Flamborough Head and Spurn Head in Yorkshire, the Naze in Essex, the N. and S. Foreland and Dungeness in Kent; on the S. coast, Beachy Head in Sussex, the Needles in the Isle of Wight, Portland Point in Dorset, Start Point in Devon, the Lizard and Land's End in Cornwall; on the W. coast, Hartland Point in Devon, Worms Head in Glamorgan, St. David's Head in Pembroke, Braich-y-Pwll and Great Orme Head in Caernarvon, and St. Bees' Head in Cumberland. E. and W. are divided into fifty-two counties, with areas and populations as follow, according to the census of 1891:—

Counties.	* Total area in statute acres.	Pop. of Ancient County.	Capitals.
England.			
Bedford . . .	298,494	160,704	Bedford.
Berks	461,742	238,709	Reading.
Buckinghamshire .	475,694	185,284	Buckingham.
Cambridge . . .	549,565	188,961	Cambridge.
Chester . . .	655,036	730,058	Chester.
Cornwall . . .	868,208	322,571	Bodmin.
Cumberland . .	970,161	266,549	Carlisle.
Derby	657,550	528,033	Derby.
Devon	1,667,097	631,088	Exeter.
Dorset	632,272	194,517	Dorchester.
Durham . . .	647,281	1,016,559	Durham.
Essex	985,545	785,445	Chelmsford.
Gloucester . . .	796,731	599,947	Gloucester.
Hants (Southampton) .	1,037,764	690,097	Winchester.
Hereford . . .	537,363	115,949	Hereford.
Hertford . . .	406,932	220,162	Hertford.

Grand Total	37,317,885	29,002,525	

The principal islands along the English coast are the Isle of Man in the Irish Sea, Walney off Lancashire, Anglesey and Holyhead, Lundy Island in the Bristol Channel, the Scilly Isles off Land's End, the Isle of Wight and the Channel Islands, Sheppey in the mouth of the Thames, and, near Berwick, Holy Island, the Farne Islands, and Coquet Isle. They are described at length under their respective names.

Physical Aspect.—The surface of E. proper is agreeably diversified by hills and plains. The hills are generally steep towards the W., but have a gentle eastern slope. A line drawn N.E. and S.W. from Scarborough in Yorkshire to the mouth of the Severn would divide E. into two portions distinct alike in geology and physical outline. To the N. the surface is broken and hilly, rising occasionally into bold heights; to the S. it is chiefly characterized by gentle undulation, and level, fertile expanse. Extending from the western declivity of the Cheviots in a direction mainly E.S.E., the Pennine chain forms the great watershed of the N. It runs as far S. as the Peak in Derbyshire, and reaches its greatest height of 2927 feet in Cross Fell, Cumberland. The Cumbrian mountains, a cluster of rugged peaks, are a western offset of the Pennine, and include Scawfell, the highest elevation in E., having 3208 feet of altitude. The basin of the Severn is partly bounded on the W. by the Cotswold, and on the E. by the Malvern Hills, while the Cambrian mountains project many spurs over the Welsh frontier. Snowdon, in Caernarvon, 3571 feet, is the highest mountain in E. and W. The Cambrians also contain Cader Idris, Arran Fowddy, the Beacons, &c. Cornwall, Devon, and Somerset are traversed by the almost continuous Devonian ranges, in which may be included the Mendip Hills. The other southern ranges are the Dorset Hills, and the N. and S. Downs. To the N. of the Thames, in Bucks and Cambridge, are the Chiltern Hills, which form part of a low, broken chain continuing in a north-easterly direction into Norfolk. The wolds in Lincoln and York are slight elevations parallel with the coast. The E. coast is low, and broken mainly by sweeping bays; on the W. the irregular shores are lined with cliffs, and frequently project in bold and precipitous headlands.

The plains are numerous and extensive. The heart of the country is a great fertile flat, varying in height from 200 to 400 feet, and extending from the Cotswold Hills to the confines of the Wash, from the Pennines to the basin of the Thames. To the N., hemmed in by the Pennines and the Wolds, the Plain of York stretches along the E. coast to the Tweed, and includes many large coal-fields. The Cheshire Plain, in the basins of the Dee and Weaver, lies between the Pennine and Welsh hills. The lowest land in E., the Eastern Plain, is partly separated from the great central one by the Chilterns, and includes the coast country from the Thames to the Wash. It comprises the Fens, the richly productive flats of Lincoln, Huntingdon, Norfolk, and Cambridge. The broad valley of the Severn is celebrated for its rich beauty and fertility. Salisbury Plain in Wilts, and Dartmoor in Devon, are tablelands. The Weald, enclosed by the N. and S. Downs, is a wide pastoral expanse.

Hydrography.—The rivers of E., which are well supplied with water, are of the utmost importance in the various industries, as well as for purposes of irrigation and commerce. By far the greater volume of water flows into the North Sea, the line of water-parting traced from N. to S. falling considerably to the W. of the centre of the country. The drainage area to the E. is 29,759 sq. miles; that to the S. into the English Channel, 7306; and to the W. into St. George's Channel and the Irish Sea, 21,255. To the S., and also generally to the W., the streams are short, and their basins narrow. The longest and noblest river in E. is the Thames, the valley of which is famous for its wealth of richly-wooded scenery. Among others conspicuous for length are the Severn, Trent, Ouse, and Great Ouse. The Mersey and Tyne are great commercial and shipbuilding rivers. Among the chief rivers of Wales are the Dee, Teify, Towey, Tawy, Usk, and Wye. As compared with Scotland or Ireland, E. is singularly deficient in lakes. Indeed, the only sheets of water of any size are confined to a portion of Cumberland and Westmoreland known as the 'Lake District.' Windermere, the largest of the English lakes, is not more than 10 miles long and 1 broad, with an area of 3 sq. miles. Another small lake is Bala, in Merioneth, N. Wales.

Climate.—Its insular position secures to E. a mild, moist climate and an unusually equable temperature. The parallel of latitude that passes through the heart of E. also traverses Labrador on the W., and Central Russia on the E., where the winters are colder by some 30° F. Free from the extremes of heat and cold to which continental countries are exposed, the mean temperature of E. in January is about 39° F., in July 62°. The W. side is particularly mild, being visited in summer and autumn by the prevailing W. and S.W. winds which bear across the Atlantic the warm air generated by the 'Gulf Stream' of Florida. Cold N. and easterly winds alternate during winter and spring, and tend to reduce the temperature of the E. side. Rain falls in greatest quantity with W. and S.W. winds; those from the E. or N. are generally either dry or foggy. The distribution of rain is very unequal, being most abundant in the W., and gradually decreasing towards the E. At Seathwaite in Borrowdale, Cumberland, the annual fall amounts to 134 inches, while the average along the W. coast ranges from 40 to 80 inches; whereas on the E. coast the average is from 23 to 30 inches—at London 24, at Cambridge 20, at York 23, at Newcastle 25. The mean number of rainy days on the E. coast is 165, on the W. 208. This difference is partly owing to the configuration of the land, partly to the prevalence of westerly winds charged with vapour from the Atlantic.

Geology and Mineralogy.—By far the greater portion of the surface of E. and W. is of sedimentary, fossiliferous strata, reaching back to the Cambrian. Only the north-western and south-western counties are covered by the older Palæozoic formations. The north-eastern portion has a basis of carboniferous limestone, which extends intermittently S. and W. into Devonshire, and contains the Cornish lead-ores. Above the limestone lie the coal formations, beginning in Northumberland, and continuing through Durham, York, Lancashire, and Stafford, into S. Wales. The coal deposits support the new red sandstone and magnesian limestone, which stretch in a narrow belt from Shields to Warwick, abounding in salt and gypsum in some localities. To the E. again of the coal and sandstone districts, the Oolite and Lias formations occupy the country, extending in a wavy line from the E. coast of Dorset to Whitby. Further E. these are succeeded by greensand and chalk, and the Wealden beds of Sussex. The Tertiary series and Diluvial clays are mainly confined to the basins of the Ouse and Thames. Wales consists for the most part of Cambrian and Silurian strata; the coal measures in the S. are very extensive. Proceeding from N. to S., the various formations of E. and W. appear in the exact order of geological arrangement, thus as it were presenting to view a complete geological section of the earth's crust.

The minerals of E. and W. constitute a main element in their industrial prosperity, and in proportion to the area greatly surpass those of any other country. The vast supply of fuel in the coal basins of Northumberland, Lancashire, Durham, Warwick, Stafford, and S. Wales, has led to the growth in these localities of immense and flourishing manufactures. Wales, Stafford, and Yorkshire are the chief sources of iron ore. As in remote times, tin is supplied by the Devonian and Cornish mines. Cornwall is also most plentiful in copper, which occurs besides in Stafford, &c. In Derby, Somerset, and Cumberland, lead is found, and some quantity of silver is extracted from the ore. Plumbago is procured in a pure state in Borrowdale, Cumberland. Solid salt is mined in Cheshire to the extent of over 1,000,000 tons in a year. Among the other more valuable natural products are zinc and nickel, arsenic and manganese, potter's clay, granite and freestone.

Botany and Agriculture.—The flora of E. generally belongs to Schouw's N. European region, and closely resembles that of Germany, comprising but few peculiar species. E. is not regarded by botanists as 'a centre of vegetation,' but as having been overrun by a series of vegetable migrations, reaching back, according to Edward Forbes and others, to the Middle Tertiary epoch, when Britain formed part of the continent of Europe. The oak, the king of native British trees, is grown (formerly for the building of men-of-war) in the 'wealds' of Sussex, Kent, and Surrey. Among the other useful indigenous forest trees are the fir, birch, beech, ash, alder, elm, hazel, willow, yew, maple, aspen, and holly. Of those introduced by man are the chestnut, lime, walnut, Norwegian spruce, larch, Lombardy poplar, mulberry, cedar, and weeping willow. The surface is now well wooded, and royal forest-lands are reserved for the growth of timber. Of these, the largest are the New Forest in Hampshire, the woods extending from Bagshot to Windsor, and the Dean Forest in Gloucestershire. There is a great variety of fruit-trees, of which the chief are the apple, pear, cherry, plum, peach, walnut, currant, and gooseberry. A rich appearance is given to the rural scenery of E. by the hawthorn hedgerows, with their wealth of wild-flowers, at times overtopping the bosky lanes.

The soil is not on the whole naturally fertile. A considerable portion of the surface is covered with marshy plains, sand downs, and rugged hills. Industry and science, however, are rapidly vanquishing every obstacle, and even at the present time E. holds the first place among the countries of the world in regard to productiveness and the development of agriculture. In part this is due to the study of agricultural chemistry, and thorough systems of drainage, but partly also to the facilities for intercommunication, which so essentially second the efforts of the farmer. Of the 37,317,885 acres constituting the area of E., there were 27,737,672 under cultivation in 1894—6,545,354 under corn crops, 2,663,106 under green crops, 2,925,963 (1,728,934 for hay) clover, sainfoin, and grasses in rotation, and 15,110,592 of permanent pasture. There were also 1751 acres under flax, 59,535 under hops, 63,533 under small fruit, and 367,838 under bare fallow or as uncropped arable land. Mountain and heath land were estimated at 3,041,278 acres. Woods and plantations covered 1,788,816 acres and 11,397 were laid out as nursery grounds. In the same year the crops were in the following proportion:—Wheat 1,883,096, barley or bere 1,877,714, oats 2,229,178, potatoes 374,595, and turnips and swedes 1,473,320. Other cultivated plants were rye 83,024 acres, beans 230,423, peas 241,919, sugar-beet 42, &c. According to the agricultural returns 'the wheat crop of 1894, so far as apparent bulk and yield were concerned and apart from the question of the very bad condition in which much of the grain was necessarily harvested, contrasted very favourably with the scanty crop of 1893, but the average yield for 1894 represented considerably varied experiences in different localities.' The crop in England was estimated at 56,087,603 bushels, and that in Wales at 1,420,082. On comparing these returns with those issued for 1885 we find that the yield of wheat in England was very much greater in that year, having been 74,021,248 bushels, as was also the case as regards the yield in Wales, which was 1,672,917 bushels. The potato crop in England in 1894 was 1,974,539 tons, but in 1885 it was 2,182,712 tons, while in Wales the crop was returned as 186,491 tons in 1894 and 212,269 in 1885. In hops, which are not grown in Wales, there was a slight increase in 1894 as compared with the yield in 1885, the weights being 636,846 cwts. and 509,170 cwts., respectively. Both in England and Wales the oats crop was very much larger in 1894 than in 1885—88,289,392 bushels in 1894, 66,933,934 bushels in 1885 (England), and 9,012,652 bushels in 1894, 8,023,645 bushels in 1885 (Wales). The yield of hay in 1894 compared favourably with that in 1885 both in England and Wales. Wheat, which thrives at an elevation of 1000 feet, is chiefly grown in the S. and E.; barley mainly in the central districts. Oats form the principal crop in the N., where they are cultivated to a height of 2000 feet above the sea. Middlesex and the neighbouring counties produce hay of a celebrated quality. The rearing of hops is mainly confined to Kent and Sussex, while the south-western counties are noted for their extensive orchards.

Zoology and Live Stock.—The existing orders in E. and W. represent a mere fragment of her former mammalian fauna, as indicated in the epoch of the Boulder Clay. They are limited to some sixty species, and comprise the fox, dog, weasel, ermine, badger, otter, polecat, marten, hedgehog, mole, shrew, nine species of bat, the squirrel, hare, rabbit, three species of mouse, two of rat, and four of arvicola. Several species, as the beaver, bear, wolf, wild ox, and wild boar, have been extirpated during the historical era. In the Miocene period we have animals of vast size, as the great elk, the rhinoceros, elephant, hippopotamus, and also tigers, hyænas, crocodiles, &c. Birds are comparatively numerous, the total number of species amounting to 274. Among these the most remarkable are the eagle, hawk, falcon, cuckoo, woodpecker, goatsucker, kingfisher, and nightingale. The peacock, common fowl, turkey, and pheasant are immigrants. Some 260 kinds of fish are found in English seas, rivers, and lakes. Conspicuous among these are the sturgeon, ray, salmon, trout, herring, pilchard, pike, cod, mackerel, turbot, eel, and whiting.

The rearing of live stock is an important branch of English industry. (See CATTLE, HORSE, PIG, SHEEP.) Devon, Durham, Hereford, Suffolk, and Sussex produce the most esteemed breeds. In Cambridge, Dorset, and Essex, large quantities of butter are made, while Cheshire, Devon, Gloucester, and Wilts are celebrated for their cheese. The sheep are divided into two main breeds, those yielding wool of short and of long staple. The latter are chiefly reared along the E. coast as far N. as Tees Water, the former in the southern counties. English horses are noted both for draught and pace. Hogs are numerous in the forest lands of Berks, Gloucester, Hereford, and Hampshire, the bacon from the last-named county being famous. In the Lincoln fens geese are reared extensively.

Industries.—Among the nations E. stands unrivalled in the extent of her commerce and the variety and importance of her manufactures. The great cause of her pre-eminence is undoubtedly her singular combination of mineral and agricultural resources. Of all English industries cotton spinning and weaving is the most important, whether viewed from the standpoint of capital or of labour. (See COTTON.) The adoption of powerful and ingenious machinery has enormously increased the production of all textile fabrics. The woollen manufacture, the oldest in the kingdom, and still of national importance, has its chief seat in Yorkshire, and centres in Leeds, Bradford, and Halifax. In London, Coventry, Nottingham, and Macclesfield, there are extensive silk manufactures. Bristol and Liverpool have great sugar-refineries and soap-boiling works, while equally notable are the distilleries and breweries of London, Burton-on-Trent, &c., the lace and muslin factories of Nottinghamshire; the hosiery and boot manufactures in Leicestershire, Derbyshire, and Northamptonshire, the tanneries of Oxford and Worcester, and the perfume factories of Windsor. Paper is now made in all parts of the country where good water can be obtained, and London is the great centre of the book trade.

E. supplies a great part of the world with metal goods. (See Great Britain.) The great coal-mines are estimated to contain some 133,862 millions of tons of workable coal. (See Coal.) Large iron and steel works are at Sheffield, Barnsley, Dowlais, Middlesbrough, and Barrow-in-Furness; Birmingham is the centre of the manufacture of iron and steel goods, chiefly pens, tools, and firearms; and Sheffield is the foremost place in the world for the production of cutlery. For copper and bronze working the foundries of Liverpool and Swansea are celebrated, as are those of London and Birmingham for bronze-casting. The specialties of Newcastle are steam-engines, iron ships, chains, iron bridges, glass, chemicals, &c. The Staffordshire 'Potteries,' including Stoke-upon-Trent, Burslem, Etruria, Hanley, &c., are noted for all kinds of china and earthenware. The great national industry of shipbuilding is carried on chiefly at Portsmouth, Plymouth, Sheerness, and on the Thames, the Mersey, the Tees, and the Tyne, but mercantile and coasting vessels are constructed extensively at all the larger seaports. Coal is most extensively exported from Newcastle and Cardiff. Of the coast industries, the principal are the herring fisheries from the North Sea ports, the pilchard fishery in the English Channel, and oyster rearing in the estuary of the Thames.

For information regarding the commerce, railways, form of government, industries, &c., see article Great Britain.

History.—1. *Civil.*—The history of E. up to the transient union of the country under the Wessex dynasty is treated under Anglo-Saxons and Britannia. During the second half of the 10th c. the old Teutonic constitution underwent considerable change; the king grew in dignity and power; the nobility of *ealdormen*, or nobility of birth, gave place to a nobility of *thegns*, officers at the royal court, whose rank sprang from their personal service to the king; the *folkland* was gradually becoming the king's private property; and feudalism was stealing into the land, colouring the early Teutonic customs and form of government. In the reign of Æthelred (979-1014) the great English monarchy which Dunstan had striven to build up fell to pieces. The old strife between Wessex and Mercia revived; the Danes renewed their invasions, and finally, aided by the English N. of the Thames, overthrew the Wessex dynasty, and founded a short-lived Danish monarchy in E. Cnut, by far the ablest of the Danish kings, sought to make E. part of a great Scandinavian empire, and did much to introduce a system of imperial feudalism, granting lands to vassal princes and earls, and strengthening the royal authority. Cnut's successors were coarse, savage sensualists, and E., wearied of their violence and incapacity, in 1042 recalled Eadward, son of Æthelred, from exile at the Norman court to his father's throne. Eadward was a foreigner in everything but his blood, and lavished his favour on Norman strangers, who now flocked into the country, while a truly national policy was upheld by the great Earl Godwine and his son Harold. The latter, on Eadward's death, was made king in 1066, but in the same year William of Normandy defeated him at Senlac, and ascended the throne, nominally as the rightful successor of Eadward, and the choice of the English people. The Norman conquest has been one of the most misunderstood events in English history. The invaders were simply Danes who had received a French varnish, men of the same blood as the inhabitants of Northumbria and the E. of Mercia, and no formal change was made in the old English constitution, William veiling his usurpation by advancing legal claims, which, though figments, made him scrupulously preserve the laws of King Eadward. The great results of the Conquest were—(1) that E. was welded into a compact nation, the separate kingdoms, which had flown asunder after every earlier attempt at union, being at last firmly cemented into a single state; (2) that the English were brought into closer contact with the Romance peoples, and won new culture and wider political relations; (3) that the growth of feudalism was in one respect checked—William developing the system of feudal tenure, but crushing the feudal principles which tended to curb the kingly power, and break up the nation; (4) that the old free institutions were in name strictly preserved, and rights, which might have gradually passed away under native English kings, were thus enabled to revive in practice, having always existed in theory, a fact to which we owe the peculiar feature of our constitutional history—secure progress by giving new force to old privileges. The period 1087—1127 is marked by a distinct English revival. The people side with Rufus and Henry against the barons. The charter of the latter renounces the 'evil customs' which had been exacted from Church and noble, and his marriage with Matilda completed the conciliation of the English. The town communities were composed to a large extent of Norman traders and artisans, and English bishops began to appear in the Church. The government was carried on by the clerks of the royal chapel under the Chancellor and the Justiciar of the king's court, which, in place of the old council, registered laws, sat as highest court of appeal, and as court of exchequer assessed and collected from the sheriffs the royal revenue, consisting of rent from the royal domains, feudal aids, Danegeld or tax, and the fines of local courts. In the weak and stormy reign of Stephen of Blois, elected king by the folk-mote of London, E. first tasted the oppression of the Norman feudalism. Henry II., the first of the Angevins (1154-89), came in under the influence of the priests Theobald and Becket. He had inherited Anjou and Touraine from his father, Maine and Normandy from his mother, and Poitou, Saintonge, Auvergne, Perigord, the Limousin, the Angoumois, and Guienne as his wife's dowry. The great quarrel as to royal rights of election and jurisdiction, &c., over the Church produced the murder of Becket. But the civil administrative policy of Henry was more successful. He commuted military service for scutage, revived Frankpledge (q.v.), and instituted trial by jury by the assize of Clarendon (under which trial by ordeal, till abolished by the Council of Lateran, took the place of compurgation, the English rival of the Norman trial by battle), made permanent the Eyre courts by the assize of Northampton, and by the inquest of sheriffs withdrew that important office from the great nobles of the shire. Great part of Ireland was added to the dominion of the Angevins. Under the Angevin kings the land was overrun by foreign adventurers and mercenaries, whom the Crown maintained; the country was tyrannically misgoverned; and the people, formerly the allies of the early Norman kings against the barons, now banded with the nobles against the monarch. John lost Normandy, and engaged in a contest with the pope, by whom he was placed under interdict. The great event of his reign was the granting of Magna Charta (q.v.). In Henry III.'s time we find the pope and the king united against the English people and Church. The Great Charter and that of the Forest were systematically violated. To the patriotic genius of Simon Montfort, Earl of Leicester, E. owes the conception and realisation of a form of representative government for the purpose of administering the principles laid down in the charters. Supported by the *Communes*, he secured their separate representation by the Provision of Oxford, annulled by the Mise of Amiens (January 1264); and although this plan was discontinued for a time, the principle was won, and thirty years later it became part of the settled practice of Parliament. The period 1265-84 is marked by the final conquest of Wales. This territory of the Britons had acknowledged the supremacy of Mercia and then of the West Saxon kings; but in spite of the victories of Harold the frontier baronies founded by the Conqueror with 'license to conquer,' and the half military settlements of Flemings and English under Henry I., the Welch spirit of independence remained unbroken, and was strengthened by the revival of national poetry in the 12th c. and the long reigns of the two

Llewellyns, the sons of Gruffyd ap Conan. During the Baron's war, Llewellyn ap Gruffyd, who had reconquered Glamorgan, was called 'Prince of Wales,' not merely 'Lord of Snowdon.' All this came to a sudden end in 1282. English barons were placed on the soil, which was divided into shires and hundreds, the castles of Conways and Caernarvon were built, trade-guilds were introduced to the towns, and the Statute of Wales abolished the more barbarous Welsh customs. In the years 1283-95, the growth or settlement of constitutional forms was rapid. It was the first Edward who restricted the courts Christian to spiritual, testamentary, and matrimonial causes, and laid the foundation of the justices' bench in the Conservators of the Peace. The Court of Chancery and the appeal to the king in council also practically date from his reign. The Statute of Winchester based a system of local police and criminal justice on the frankpledge; the Statute of Merchants provided for the recovery of commercial debts; and the statute *Quia Emptores*, while prohibiting subinfeudation, really tended to promote the transfer of land, and to free it from the rigour of feudalism. Undoubtedly, however, the most important change related to the introduction into the Great Council or Parliament of (1) the knights of the shire, elected by the freeholders in the shire-mote or county court; and (2) the representative burgesses from the towns. Previous to this, the officers of exchequer had to make a separate negotiation with the town-reeves, the sheriff and shire-mote of each county, and the archdeacon of each diocese. The clergy were also summoned to Parliament, but they would vote nothing except in Convocation, and before Henry VII.'s time it had ceased to be the practice for them to attend. The Parliament itself, instead of meeting at Winchester, Acton Burnell, Northampton, or Oxford, always met at Westminster. The old right of direct appeal to Parliament against injustice or oppression still lives in the election of Triers of Petitions by the House of Lords. The attempts made to govern Scotland, mediately according to the marriage treaty of Brigham, and immediately by an English council of regency, did not succeed, nor did the scheme adopted on the death of Wallace of giving Scotland ten representatives in the common Parliament. Above all, this is the period when the English boroughs completed their emancipation by obtaining the right of justice in the borough court, the right of self-government and self-taxation. Inside these boroughs the merchant-guild of land-owning traders had in many cases absorbed the earlier and minor frith-guilds, and had now the control of municipal affairs, of markets, fairs, tolls, coinage, recovery of debts. The differentiation of trades began: the cloth merchant was separated from the tailor, and the leather merchant from the butcher. Now also arose among the poorer inhabitants the craft-guilds, with their wardens and craft-boxes, enforcing uniformity of apprenticeship and work, first by voluntary custom, and then by royal charter. Especially in London there was a long and furious war between the aldermen, 'magnates,' or even 'barons' as they were called, the 'greater folk' or *prudhommes* of the merchant guilds, and the unenfranchised craftsmen, who, first under William of the Longbeard and then under Thomas Fitz-Thomas, attempted to take the town-mote into their own hands. Under the livery companies of Edward III. there was a true popular *commune*. E. now did a trade with Norway and the Hanse towns, a wool trade with Flanders, a wine trade with Gascony. Italian vessels frequented the port of London, and Italian bankers settled in London. The completion of Salisbury Cathedral and Westminster Abbey indicates wealth. But neither the traders nor the tenant farmers, whom the enclosure of commons and system of leases were creating, took any part in government. The resistance to the king's power was left to the barons. It was, indeed, from their standing committee or continual council that the first Edward received his crown. Private wars among the barons, the excesses of the 'trailbastons' or club-men, corruption of the judges, and legal and popular persecution and final expulsion of the Jews, mark this period. The important constitutional check on the nomination of the great officers of state, formerly called 'clerks of the king's chapel,' was asserted by the Lord Ordainers in their articles of reform (1310); and in 1321 the York Parliament made the famous declaration with regard to the consent of the prelates, earls, barons, and universality of the realm. In 1328, by the treaty of Northampton, the independence of Scotland was recognised. From 1337 to 1453 has been called the Hundred Years' War. While the woollen manufactures in the Flemish settlements on the E. coast and other trades flourished, the political and intellectual spirit of the nation was starved by the miserable war with France, which had no result but to fill that beautiful country with *Jacques Bonhommes*, or insurgent peasantry, and 'free companies' of disbanded soldiers. No doubt the Commons were now consolidated by the union of knights and burgesses, and the modern statute took the place of the royal ordinance. But though the Good Parliament, headed by Peter de la Mare, asserted the right of free election (the writs having been tampered with by the king), and protested against arbitrary taxation, they could do little against the Church, which numbered 30,000 priests in a population of two millions, and owned a third of the soil, while their spiritualities amounted to twice the royal revenue. The Statutes of Præmunire and Provisors asserted the control of the civil power over the publication of papal bulls and the disposition of vacant benefices. But this did not stop the influx of Italian priests to E. The religious orders had become mere landowners, and the seculars, by selfish use of their wealth, had lost all spiritual influence. Wickliffe argued against the temporal power and privileges of his order, affirmed the right of free interpretation of the Bible, and denied the cardinal doctrines of Rome. The influence on the English mind of the short tracts which the Simple Priests or Lollards diffused among the people can hardly be exaggerated. They sowed the seeds of political principles which are still bearing fruit. In 1381 occurred the peasant revolt under John Bull and Wat Tyler. This event had been prepared by the changes in the condition of the serfs and bondsmen. Many of the villeins and cottars rose to be farmers, *i.e.*, they paid a fixed rent instead of the indefinite agricultural services previously exacted. Underneath this class of copyholders the bordars or labourers also lost their servile *status* and became free contractors for hire. The harsh statutes which were passed after the ravages of the Black Death to secure labour at customary wages, and especially the 'Fugitive' law, which confined men to a parish and made the harbouring of labourers in towns a crime, led to the great socialist outbreak, of which the immediate occasion was Richard's attempts to impose a poll-tax. The gospel of equality was preached by William Langland. The landowners, unable by unjust statutes to control the labour market, turned their attention more to sheep-farming, and by evicting the tenants of the small allotments, greatly reduced the number of the villein class and augmented that of the free labourers. The attempt of Richard II. to govern by a committee of twelve peers and six commoners was followed by the Lancastrian revolution, which brought on at home the Statute of Heretics, directed against Lollard preachers, schoolmasters, and believers generally, and abroad the conquest of France, Henry V. being recognised as the future king. The English national debt was now about £4,000,000. During the 15th c. charters of incorporation confined civic power, and especially the parliamentary franchise, to the select men of the common council, and the forty-shilling freeholder was introduced in the counties. The Club Parliament shows that supreme power rested with the great barons. By 1453 all the English possessions in France, except Calais, were lost. The rising of Jack Cade, whose Complaint of the Commons referred chiefly to free election and free labour, introduced the Wars of the Roses (1455-85), in which the House of York claimed the throne by descent from the fifth son of Edward III. The King-maker, the 'last of the barons,' Warwick, is the principal figure in the contest. These wars were practically decided by artillery, the great enemy of feudal war. Fortunately the towns took little part in the struggle, and trade did not suffer. But in the period of the new monarchy (1485-1509) Parliament is superseded by royal council; arbitrary taxation, imprisonment, and espionage become common. The baronage had been greatly thinned in number by the civil war; the Statute of Liveries broke up the military households, and it is supposed that nearly one-fifth of the land passed into the hands of the king by forfeiture. A religious movement, represented by More, Latimer, and Erasmus, protested against war, interested itself in the teaching at grammar-school and college, and recalled the Church to the simple faith in Christ, and the study of the newly-edited Bible at first hand. The rule of Wolsey (1515-31), as Chancellor and Papal Legate, based the Tudor despotism on the policy of peace, but at home the wholesale enclosures and evictions produced a great agrarian discontent, and Wolsey, who fell with Catharine of Aragon, was succeeded by Cromwell, who suggested to Henry the plan of declaring his supremacy in Church as well as State. Then followed what may be called the English Reformation. By the articles of religion the sacraments were reduced from seven to three—penance, baptism, and the Lord's supper. Justification by faith was strongly asserted, while purgatory, prayers for the dead, pilgrimages, pardons, and the mass were condemned. Transubstantiation and confession were retained. The dissolution of the monasteries was the prelude to the reign of terror, and the Pilgrimage of Grace was quenched in the blood of the Catholic nobles. The intimidation of Parliament and corruption of the courts of justice made possible the disgraceful excesses of the early Protestants against the Church; and these again caused the Catholic reaction expressed in the Six Articles, and the fall of Cromwell, whose favourite policy of a Christian league with the German princes against the Empire was never carried out. In Edward's reign (1547-53) the wheel turned again; the mass was denounced, the ornaments were snatched from the churches, priests were allowed to marry, and the liturgy and catechism superseded the missal and breviary, and wooden tables the stone altars. Cranmer's forty-two articles of religion were rigorously enforced by a new set of Church laws. Amid the greatest confusion in the Church, and while the nobles were plundering the old guilds and chantries, the king founded eighteen grammar-schools. The evil times marked by the Spanish marriage of Mary (1554), the submission to Rome, and the martyrdom of Latimer, Ridley, Hooper, Cranmer, and the rest, were followed by the comparative quiet, peace, and conciliation of Elizabeth's reign (1559-1603). She founded in 1601, the English poor-law, which first distinguished between the impotent and destitute, and those broken men and sturdy beggars who were compelled to settle in a parish and work. The style of farming was greatly improved, and the spinning of yarn, and weaving, fulling, and dyeing of cloth became important. On the ruin of Antwerp (1585), London became the mart of the world, and Gresham founded the Royal Exchange, Chancellor opened the trade with Archangel, and Hawkins the slave-trade on the Guinea Coast. In domestic arrangements there was a great advance in comfort and cleanliness, even in luxury. The Elizabethan hall took the place of the baronial fortress. Members were summoned to the Commons from sixty-two new boroughs, and the exemption of members from arrest was obtained. Custom-duties were arbitrarily imposed, and money was raised by privy seals, the forerunner of the Exchequer bills, but no benevolences were raised, and in 1601 the Act for the abolition of trade monopolies was passed. The persecution of the seminary priests was forgotten in the glow of patriotism called forth by the Spanish Armada (q.v.). As a whole, Elizabeth's reign was distinguished for bold naval enterprise and a marvellous burst of original literary power. The rise of the Puritans at the beginning of the 17th c. shows the hold which the English Bible was taking on all classes. The outrageous Calvinism of the Presbyterian Cartwright was opposed by the vague and optimistic philosophy of Hooker, and a succession of primates exercised spiritual despotism through the Ecclesiastical Commission. The pamphleteering vigour of the Separatists suggested that the license of printing should be strictly limited by law; and the 'Marprelate controversy,' and attempt of Cartwright to establish synods and classes in Northamptonshire, were suppressed. The absurd blunder of King James about absolute or divine right of kings was made matter of doctrine in the canons of the Church, and was extended to the bishops. The failure of the Hampton Court Conference lent greater spirit to the opposition in Parliament, which was mainly Puritan, and which, roused by the illegal imposition of subsidies, culminated in the Petition of Right. Eliot, Pym, and Hampden are the heroes of the Parliamentary struggle, and the story of the Pilgrim Fathers is the best commentary on the High Church policy of Laud. The period 1629-40 witnessed the tragedy of the ship-money, to be followed by the civil war, in which Cromwell's Ironsides undoubtedly saved the liberties of E., not merely in battle, but afterwards by the position they occupied towards the Parliament. The succeeding years after the king's death really belong to the life of Cromwell, for he is at the head of everything. The restoration of 1660 has been described as the beginning of modern E., in which industry, science, and love of popular freedom are the moving forces. The theology of the Reformation and the dread of Tudor and Stuart despotism had both lost their influence. The narrow and intolerable rules of Puritanism were broken, and while the wilder reaction towards immorality and irreligion may have been confined to London and the court, the great mass of the people 'gladly returned to Maypoles and mince-pies.' Perhaps, however, the most powerful influence of the time was the teaching of Bacon. The Oxford Society of Wallis, Wilkins, Petty, and Ward, developed into the Royal Society (1662), and Harvey was succeeded by Halley, Hooke, Boyle, Sydenham, Woodward, Ray, Newton. Along with them appeared the Latitudinarian school of religious thought, which was founded by Lord Falkland, and contained Chillingworth, Taylor, Hales. The spirit of these men was first for toleration and then for reason, as against the infallibility of the Church and the rigid special interpretations of Scripture which the Puritans had made matter of life and death. They were succeeded by Burnet, Tillotson, and Butler. The theory of government was also profoundly affected by the daring scepticism of Hobbes, and by the moderation and sense of his disciple, Locke. In the Convention which Charles found sitting, there was in fact no dispute on any of the great constitutional struggles of the past. The royal revenue was now fixed at £1,200,000, and many oppressive feudal claims of the Crown were extinguished by the conversion of land tenures from knight-service to socage. While Royalists were allowed to regain their confiscated private estates, the Convention protected those who had purchased Church lands. The first new Parliament was, however, entirely Royalist, and failed to carry out the promises of religious freedom made in the Declaration of Breda. The Test and Corporation Acts were passed against Puritan influence in the boroughs, and the Act of Uniformity drove 2000 rectors and vicars from the Church, with Howe and Baxter at their head, and thus created dissent, one of the great political as well as religious forces of modern E. This was followed by the Conventicle and the Five-Mile Acts. Episcopacy was restored in Scotland by the Drunken Parliament, and Cromwell's temporary union of the three kingdoms was broken up. The Declaration of Indulgence was only part of a scheme which Charles formed for establishing the Catholic religion. It was at once recalled, and Shaftesbury carefully fanned the rage of the 'Petitioners' for war against Catholic France, a feeling excited by the Popish plot. The 'Petitioners' and the 'Abhorrers,' who answered them, are the germs of the early Whigs and Tories, the great issue then being whether hereditary succession was to admit a Catholic to the throne. The Parliament of 1681 was called to Oxford, and Charles went there with troops; but the danger of civil war was averted by the flight of Monmouth and the death of Shaftesbury. And yet it was in this disgraceful reign, while the Triennial Parliament Act was constantly broken, that in 1679 censorship of the press was put an end to, and the grand principle of Habeas Corpus was reaffirmed. The period 1682-88 has been called the Second Stuart Tyranny. This was rendered possible by the forfeiture of a great many borough charters on the pretended ground that they had abused their privileges; and it was supported by such means as Jeffrey's Bloody Assize and a standing army of 30,000 men. The Church and the Universities were bullied, and the Nonconformists were bribed by a second Declaration of Indulgence, annulling all penal laws against both them and Catholics. The trial of the seven bishops and the organization of Catholic power in Ireland by Tyrconnell brought matters to a crisis, and Danby, Compton, and Cavendish invited William of Orange to come to the rescue of the constitution. He landed in 1688, and James II. fled to France—this dethroning of the last Stuart king being known as the English Revolution. In the Convention which William summoned, a great deal of wrangling as to whether the crown had been forfeited, whether there should be a regency, whether Mary had succeeded, or whether the throne was vacant, ended in the recognition of William and Mary as joint sovereigns on the basis of the Declaration of Rights, which denied the right of the sovereign to exercise a dispensing power, or to exact money or maintain an army save by the assent of Parliament. Henceforth the right of the British sovereign to the throne becomes purely statutory (the Bill of Rights and the Act of Settlement). The rights of petition, free election, free debate, and pure justice in the courts were also asserted. Scotch affairs were settled by the Claim of Right, which restored Presbyterianism and the Confession of Faith, with the unwelcome addition of an Act of Toleration. Instead of life-grants, the vote of supplies was made annual. The Mutiny Act for the standing army, now become essential, was also made annual. Hence annual Sessions were now a vital function of the state. The Act of Grace was a wise concession to the Nonjurors within the Church and the Jacobites, outside. All this time the Grand Alliance had failed to curb the ambition of France, and on the advice of Sunderland the first homogeneous Ministry was formed by William out of the junto of Whigs who were favourable to war. Montague, Chancellor of the Exchequer, adopted Paterson's plan of a Bank of England, and courageously reformed the coinage. In the meantime the desperate resistance of Ireland had been overcome. When France threw overboard the Partition Treaties, E. necessarily entered on the war of the Spanish Succession (1702-13), in which the victories of Marlborough revived the memories of Creçy and Agincourt. In 1707 occurred the Union of E. and Scotland, delayed by the Scotch objections to the National Debt and Episcopacy, and the English love of colonial monopoly. The Scotch Parliament had indeed struck the name of Princess Sophia from the Act of Parliament. It is to the patriotism of Lord Somers that the chief credit must be given for the defeat of the Nationalists and Federalists, and the securities given for Scotch law and the Scotch Church, along with a fair representation in Parliament and complete freedom of trade. In this, however, he only followed the more enlightened policy of Cromwell. From this point the history of E., along with that of Scotland, becomes the history of GREAT BRITAIN (q.v.).

2. *Ecclesiastical.*—Christianity, which entered Britain in the Roman period, but was for a time swept away by the Teutonic settlers, was reintroduced in 597, when Augustine, despatched as a missionary to the English by Pope Gregory, landed at Thanet and converted Æthelberht, King of Kent. The new faith spread over the land, and in the beginning of the 7th c. was diffused by Paulinus through Northumbria, which was also influenced by Christian missionaries from the Culdee monasteries in Scotland, offshoots from the Irish Church, then pursuing an isolated career independent of Rome. After a bitter struggle with heathenism in the Midlands, and with the Irish Church, which at one time seemed about to annex the North country, the English Church established its supremacy, and was organized by a Greek monk, Theodore of Tarsus. As in E. the early Christian Church of the Roman period had been quite eradicated, Theodore's organization was determined by the existing political divisions of the country. He appointed bishops, whose sees corresponded with the kingdoms to whose rulers the first missionaries had attached themselves, settled the clergy in parishes, which were at first conterminous with the estates of the great nobles, made Canterbury the central see, and severed all alliance between the English and the Irish Church. E. was thus brought into contact with the civilising influence of Rome; learning and art entered the land; and the English clergy were freed from the lax discipline, confusion, and narrowing isolation of the Irish Church. The new Church grew rapidly in wealth and power, fostering literature and taking an active part in political events, Dunstan in particular being at one time both ecclesiastical and secular head of the kingdom, and doing much to increase the Church's influence in civil affairs. The Conquest broke this intimate association of the clerical with the secular power. William of Normandy supplanted English by foreign churchmen, who were cut off from their flocks and very largely dependent on the king. From William Rufus to Henry II. there were frequent disputes between the Crown and the Church, in which the people always took the ecclesiastical side. In one respect the English Church differed from the Churches of continental Europe. In other countries the clergy were a separate *estate* in the government; in E. the greatest churchman mingled with the nobles in the House of Lords. They were more bound up with the national interests, and were less of a class depending on the pope in E. than in the rest of Christendom. The contest between the king and the clergy soon shifted its aspects. In the dispute between Anselm and Rufus and Henry I., the churchman represented the claims of Rome; in the reign of Henry III. the king and the pope struggled together against the English Church and the English people. In the 14th c. the Church, which had sheltered freedom and learning, and done much to soften the evils of feudalism, sank into apathy and worldliness, and called forth the bold censure of John Wickliffe, 'the first Protestant.' He declared that the gospel is a perfect rule of life without clerical intervention, and combated the doctrines of papal supremacy, indulgences, pardons, absolutions, and worship of saints and images. He gained many disciples, nicknamed Lollards (q.v.), who, though cruelly persecuted, increased in numbers after Wickliffe's death. In the reign of Henry VIII. the ties between Rome and the English Church were broken. Thomas Cromwell's aim to reduce the Church to a department of the state was achieved for a time through Cranmer's suggestion that Henry should appeal to the Universities for the divorce from his queen, which the pope refused to grant. This expedient proving successful, a series of measures were passed which totally changed the character of the English Church. Henry was made Protector and Head of the Church, which became during the rest of his reign the tool of his despotism; the bishops were mere royal nominees, all connection with Rome was severed, first-fruits of the Church livings, formerly enjoyed by the pope, were confiscated to the throne, and the monasteries suppressed (1536). During Edward VI.'s reign the Reformation, now become a popular movement, advanced swiftly; the Common Prayer-book received its present form (1552), and men were commanded to subscribe to the forty-two articles of faith drawn up by Cranmer and Ridley, and afterwards under Elizabeth reduced to thirty-nine. At this time the English Church seemed tending to become Genevan, but on Edward's death Mary restored Catholicism, and subjected the Reformers to a terrible persecution. Her successor, Elizabeth, had to decide between the Church of Rome, the extreme Protestants, many of whom had been exiled to Geneva, and the moderate Protestants, led by Parker. Elizabeth enlisted with the last party, which wished to exclude papal authority from England, and to preserve as much of the old Church discipline and belief as was compatible with the removal of error and corruption. Thus was formed the present English Church, which still bears traces of the conflicting beliefs amid which it arose; its creed showing the influence of the Genevan party, and its liturgy and ritual recalling the older Church from which it sprung.

The English Church does not recognise the validity of orders unless conferred by a bishop, and she recognises the ordination of the Eastern and Western Catholic Churches. The English bishop, moreover, is entitled to refuse ordination. The present division of England into bishoprics (though many of the sees are old, and the two provinces also) rests on the Act 6 and 7 Will. IV. c. 77, which gave effect to the report of the Ecclesiastical Commission. (See BISHOP.)

Every diocese is divided into archdeaconries, whereof there used to be sixty; every archdeaconry into deaneries, and deaneries into parishes. The Archbishop of Canterbury, formerly legate of the pope, is primate of All England, the Archbishop of York is primate of England. Then come the Bishops. For the inferior dignitaries of the Church, see Priests, Parsons, Deans, and Ordination. Curates are either stipendiary, the temporary assistant of the rector or vicar, or perpetual, officiating in a parish or district to which the impropriator has nominated them. The latter institution arose from the transfer of benefices (in which there must always be a vicar) from spiritual societies to a single lay person, who of course could not serve the cure. There are a few peculiar preferments called donatives, because the patron can instal the donee without presentation to, or institution by, the bishop; *e.g.*, the church in the Tower of London is the king's donative. The stipendiary has to make a solemn declaration that a certain stipend has been agreed upon, and that no abatement is to be made for rent of the glebe, &c. The bishop may appoint curates where the incumbent is absent so many months in the year, or where the duties are ill performed; and he also fixes their salaries in cases of non-residence. The salary is never less than £80, unless the value of the benefice be less. (See Curate.) The bishop has complete power over him by direct removal, and indirectly by revoking license. The 'departing bell' and the alms given at funerals are probably founded on the old practice of 'masses satisfactory,' or prayers for the dead. Burial is still sometimes permitted in the church, but discouraged for sanitary and economical reasons. Every parishioner, even a suicide, is entitled to burial in the churchyard, if it has not been closed by the local authority and if there is room, but not to burial in any particular spot, iron coffin, or vault. A faculty obtained from the ordinary will, however, give him that right also. The Cemeteries Clauses, the Burials Act of 1880, and those constituting Burial Boards for parishes or boroughs, &c., provide for a portion of the ground being unconsecrated for the use of Nonconformists, for burial in churchyards *without church rites*, for the purchase of ground for cemeteries, &c. While the parson may not refuse burial, it must be accompanied by the Church service (if he be requested to conduct it), according to the rites of the Church of England, and he is entitled to a fee, the origin of which was the oblation for prayers at religious houses. Of a similar kind are mortuaries, or corse presents, depending on custom. The Catholic form, 'Pray for the soul,' &c., is permitted. The liturgy and ritual of the Church strongly suggest her continuity with that before the Reformation. The Prayer-book contains the Breviary, the Missal, and the Ordinal. It is a translation of ancient Catholic liturgies. The rites, or services expressed in words, and ceremonies (gestures and acts which go along with words, including the use of lights, incense, and vestments) are not new.

An enormous revenue, under the name of 'tithes,' was drawn by the Church from every description of annual produce down to 1837, when the series of Tithe Commutation Acts brought in a corn-rent fixed in quantity though fluctuating in money value, and subsequently a rent-charge which ultimately frees the land. (See Tithes.) The name of offerings, oblations, obventions, apply chiefly to Easter dues (2d. per head, and in London 4d. a house), Pentecostal or Whitsun farthings, and the small sums paid at the other two great feasts (Christmas and Dedication). Fees proper are taken when the surplice is put on, or other act done by the priest for behoof of individuals. They arise on marriage, burial, &c., but not on baptism; the old name is *altarage*. Large landed estates belong to the various sees and to the deans and chapters, and single prebendaries and minor cathedral corporations have also estates. Much of the property and of the administrations belong to the Ecclesiastical Commissioners (q.v.). It is subject to Annates (q.v.), tenths, land-tax, and several public rates. In 1868 all compulsory church-rates were abolished, but voluntary rates may still be agreed upon.

For an account of the great assembly of the Church, see Convocation. Besides her former exclusive connection with the universities, the Church had a power of visiting the grammar-schools and licensing teachers. It was long debated whether a conscience clause could be permitted in these schools, and whether Dissenters might be appointed trustees. An Act in 1860 gave relief in the first of these matters, which was extended in 1868 to the seven public schools. The latter point was gained in the Endowed Schools Act of 1869, which also destroyed the episcopal power to license, and removed the necessity of masters being in holy orders. The Education Act of 1870, in section 97 (1), provided that no grant of money shall be made in respect of any instruction in religious subjects; it also provided that the religious instruction, if any, should be given at the beginning or end of the secular instruction, and that no child, attending a public elementary school of whatever description but earning a grant, should be required, as a condition of his or her admission to the school, to attend any religious lesson, lecture, &c., either at the school or elsewhere. For an account of Church extension, see Ecclesiastical Commissioners and Queen Anne's Bounty.

To enforce its law the Church has a system of courts of archdeacons, diocesan consistorial courts, and the courts of the primates or provincial courts.

See the Histories of Freeman, Stubbs, Froude, Macaulay, Green, &c.

Englanté.

Englan'té, or **Fruc'ted**, in heraldry, means fruited or fruit-bearing (usually an oak-twig bearing acorns of a different tincture from that of the leaves), and the expression is used of trees when tree and fruit are of different colours.

Eng'lish Bazar' (Angrazabad), the chief town of Maldah district, province of Bengal, British India, on the Mahananda River, close to the ruins of Gaur, and 188 miles N. of Calcutta. E. consists of a series of trading villages lining the river bank. It has some silk-weaving industry, and the vicinity is very productive in the silkworm mulberry. There is a considerable trade in grain. The town is protected by an embankment from the continually occurring inundation by the waters of the river. Pop. 13,818, of whom 8057 are Hindus, 5746 are Mohammedans, and 8 are Christians.

English Chann'el (the *Oceanus Britannicus* of the Romans; Fr. *La Manche*, 'the sleeve'), the narrow sea separating the southern shores of England from the northern coast of France. It extends from the Atlantic to the North Sea, covering an area of 23,900 geographical sq. miles, and is 100 miles wide at the Chops, between Land's End and Ushant Isle. Reaching its greatest breadth of 140 miles between Portland Bill and St. Malo, it narrows at Dover Strait to 21 miles. It contains the Scilly Isles, Channel Isles, Isle of Wight, &c. Strong westerly winds prevail, and a strong current runs in the direction of the North Sea. The depth of the Channel varies from 5 fathoms where there are sandbanks to 60, where the bottom is a coarse gravel. The Strait of Dover—12 to 30 fathoms—is paved with a chalk ridge, linking the two countries, and through this it is proposed to carry a submarine tunnel, the experimental works of which were begun on the French and English sides in 1877. The Channel is noted for its pilchard, mackerel, and oyster fisheries.—**E. Harbour** is the name of two fine havens, one on the S. coast of the British island of Antigua, the other on the Pacific shore of Costa Rica, in Central America. On the Antigua haven there is a trading town of the same name.—**E. River**, the estuary of the Manhissa, enters Delagoa Bay to the N. of Zulu Land, on the E. coast of S. Africa.

English Drama. See Drama and English Literature.

English Language. The English speech was originally a pure Low German dialect of the Teutonic group of the Aryan or Indo-European family, its nearest cognates being the old Frisian, old Saxon, Dutch, and Flemish. It was brought from the Continent to Britain by various Teutonic tribes, who, beginning their settlements about the middle of the 5th c. [Skene in his *Celtic Scotland* (vol. i. chap. 2-3) discusses this point, and argues with much cogency for an earlier date—the latter half of the 4th c.], gradually exterminated or drove westward the native Celts, and called the country Ængla-Land ('land of the Angles or English'). The history of the E. L. may be thus divided :—(1) Old or Early English, A.D. 450-1120 ; (2) Middle English, 1120-1300 ; (3) New English, 1300 to present time.

I. *Early English.*—The language of the Teutonic settlers in Britain, to which the misleading name Anglo-Saxon has long been applied (see ANGLO-SAXONS), was, on its introduction into the island, fully inflected and almost free from foreign alloy. It was only slightly modified by the speech of the conquered Celts, few Celtic words appearing in English writers up to A.D. 1100. Such as were absorbed by it were mostly what the English would learn from Celtic slaves, *e.g.*, *basket, barrow, button, coat, funnel, gown, mattock,* &c. After the Christianization of the English in the 7th c., various Latin words, chiefly ecclesiastical, were introduced by churchmen and English translators of Latin writers, *e.g., saint, priest, candle, altar, church* (Greek), &c. This element is called Latin of the Second Period ; while the earlier Latin infusion left by the Roman colonists, chiefly seen in names of places, such as *castra*, is styled Latin of the First Period. The Northmen or Danes, who began to invade England in the first half of the 9th c., and made a permanent settlement in the N.E. of the country in 878, helped largely to strip English of its inflection—a simplification incident on the mingling of peoples speaking different tongues—and introduced numerous Scandinavian words, such as *are, until, fro, ill, bark, bask, brave, dash, fly, ransack, earl,* &c. In the S., where the Danish element was almost entirely absent, the old inflections lingered much later than in the N., where the Norse influence is still visible in the names of places and in the provincial speech. Before the Norman conquest there were two great dialects of English—the Northern, which, after taking the lead as a literary medium, gave way, from a variety of political causes to the Southern, or language of Wessex. These dialects arose from the original differences in the speech of the Teutonic settlers, the N. being colonised by Angles, and the S. mainly by Saxons. Old English was largely monosyllabic, pithy, picturesque, and copious, although somewhat rugged and wanting in melody and pliancy, qualities gradually gained after the Norman conquest of 1066, which at first threatened to destroy English as a literary language. It must not be supposed, however, that the Normans deliberately strove to root out the English speech, though such a notion is still vaguely entertained by many. There is not a shadow of evidence to show that they cherished any dislike to it whatever. Through the force of political circumstances it was lowered for a time from a literary, courtly, and official language to a popular dialect. At first English and Norman-French stood quite asunder. French was taught at school, and used in literature and law ; no man who knew English only could advance in public life ; and even rustics sought to speak in French, the language of the court, clergy, nobility, and authors. But the mass of the people clung to their old idiom, which, as is seen in the *English Chronicle*, underwent almost no change for about fifty years after the battle of Hastings.

II. *Middle English*, 1120-1300.—The influence of the Norman conquest, though great, is apt to be overrated. The disuse of English as the fashionable and literary tongue hastened the omission of inflections, the breaking up of the grammar, and the rise of great dialectic differences in the absence of an acknowledged literary standard. The loss of inflections and the simpler grammar which distinguish Chaucer's language from Ælfric's are not, however, solely due to the Conquest, for like changes have occurred in Low German tongues unaffected by events similar to the Norman invasion. The popular belief that modern English is the result of a mixture of Old English and Norman-French is utterly false. English is radically a Teutonic tongue, and the large French infusion in our present speech was mainly introduced since the end of the 13th c., after English had revived as a literary language. While Englishmen and Normans were two hostile classes, few French words crept into the E. L., nor was French chiefly used even for government documents until the 13th c., when it was the official tongue of half of Europe. In the 12th c. grammatical disruption went on more actively than the adoption of new words, but English, as it re-arose, absorbed much of its Romance rival, and in the 13th c. many old Teutonic words were displaced by French equivalents. Middle English is mainly distinguished from early English by the substitution of auxiliaries and prepositions for the old inflections, the general contraction in spelling, the softening of certain consonants, the use of *to* before the infinitive, and the adoption of *s* as the plural ending, after a struggle with the *n* termination still seen in *men, oxen, children,* &c. The genitive is still in *es*, and there is still an accusative in *en* ; but the inflectional endings tend to change into a silent *e*, which has been since shaken off from most words. The grammar is very confused and clearly transitional. The chief literary remains in Middle English are the last part of the *English Chronicle*, Layamon's *Brut*, the *Ancren Riwle*, and the *Ormulum*. In the two texts of the *Brut* (about 1200), which comprise 56,800 lines, there are not above 90 words borrowed from the Norman-French. In the *Ancren Riwle* (about 1220), there is the comparatively large proportion of 3 per cent. of French words. In these works English revived as a literary speech, while Norman-French was gradually sinking into a provincial dialect distinct from the language of Paris.

III. *New English*, 1300 *to the Present Time.*—In the 14th c. English had become the natural speech of the Normans, while French was acquired at school, almost as a foreign tongue, to equip men for literature and polite society. The wars with France helped to kindle a revolt against this undue preference of French as the speech of fashion and culture. In 1363 it was enacted that henceforth law pleadings should be carried on in English, as French was becoming unknown in the kingdom ; and before the end of the century English was securely reinstalled as the language of the court and of such writers as did not express themselves in Latin. The English speech, which was thus restored to its old position, had, in the times following the Conquest, been broken up into many local varieties, but had only three strongly-marked dialects—the Northern, spoken in most of York, in Durham, Northumberland, and the Scottish Lowlands ; the Midland, spoken in the centre and E. of England, from the Humber to the Thames ; and the Southern, spoken in England S. of the Thames, and in Gloucester, Somerset and part of Worcester and Hereford. These dialects are most easily distinguished by their various manners of inflecting the present plural indicative, in all forms of which the Southern employs *eth*, the Midland *en*, and the Northern *es*. The Midland was, moreover, divided into W. Midland, spoken in Cumberland, Westmoreland, Lancashire, Cheshire, Shropshire, &c. ; and E. Midland, spoken in Lincolnshire, Norfolk, Suffolk, Cambridge, Northampton, &c. The latter variety, aided by its geographical position between the N. and S., became the dominant form. First made widely current by Robert of Brunne, who about 1303 composed the *Handlyng Sinne*, it was used by Wickliffe and Gower, and was fixed as the classic dialect by the genius of Chaucer, since whose time the E. L. has changed comparatively little. In the 16th c. there were three dialects—the Northern, the Midland, which had spread over the S.E. counties, and the Western or old Southern. The once ruling speech of Wessex sank into a mere provincial variety, but the Northern dialect survived in Scotland, was there adorned by a series of great poets, and is now the purest relic of Early English, embracing many fine Teutonic words lost to the classic dialect of the south. The E. L. on its revival in the 14th c., while it had become by French influences more rich, flexible, and polished, was radically the speech of Ælfric. Chaucer's language is essentially Early English, with a new element of lightness, flowery delicacy, and dainty brilliance gained from the French, with Gallic fluency and grace wedded to Gothic vigour. But the effects of the Norman conquest on the E. L. were not solely beneficial. One evil result was the loss of many Teutonic words which were driven out by weaker French synonyms. The old English poetic diction especially suffered, about a third of it being held to have vanished before 1200. The Romance infusion also checked the free expansion of the Teutonic element, the language losing its power of making fresh compounds from Teutonic roots, as writers preferred to borrow new words from the Latin and French. Besides swelling the vocabulary, the French exerted a certain formative influence over our speech, as, for example, by adding the Romance ending *age* to the English *bond* in *bondage*, by changing the English *u* into *ou*, by substituting *qu* for the early *cu* in such words as *quick*, *qualm*, *queen*, *quoth*, &c. On the other hand, many French words received an English form in which their Romance origin can scarcely be detected, while another effect of the long predominance and large influx of French was to give a modulation to the speech quite distinct from the old English accent and rhythm. From the subtle interaction of English and French during the rise of the present form of our language, it is often difficult to say whether a word is of Teutonic or Romance origin; and, moreover, several apparently Latin derivatives brought in by the Normans were Celtic or more often Teutonic roots, while Norman-French, though essentially a Romance tongue, was at the time of the Conquest thickly sprinkled with Scandinavian words.

In the 15th c. the East Midland continued to spread; inflections still further fell away; Romance prefixes and affixes were welded to Teutonic words, and *vice versâ*; the language became more uniform as the Romance element was slowly fused with the Germanic. The introduction of printing by Caxton (about 1470) aided greatly to fix the grammatical structure of English. During the 16th c., when the Renaissance spread into England, and enthusiasm for the classics was at its height, Greek and especially Latin words, many of which have since been forgotten, poured into our vocabulary. Even in the Elizabethan period the E. L. was in a partly transitional state. The national speech had then to express a vast wealth of new thoughts, feelings, and discoveries, and fresh words were needed, especially to convey abstract ideas. Many words were culled from the Latin which are now obsolete, as *stelled*, 'starred,' *aidant*, *disnoble*, *rubious*, *renege*, 'to deny,' *ruinate*, *continuate*, *rondure*, 'a circle,' *accite*, 'to summon,' *charactery*, 'what is written,' *antres*, *ingen*, 'ingenious,' *copy*, 'plenty,' &c. Latin and Greek words which have since been limited in meaning were used in a general sense, as *aggravate*, 'to add to,' *journall*, 'daily,' *exorbitant*, 'uncommon,' *travail*, 'work,' *extravagant*, 'wandering,' *conceited*, 'fanciful,' &c. Other Latin and Greek words occur in a narrower sense than now, as *abridgment*, 'a dramatic performance,' *influence*, 'the influence of the stars,' *ovation*, *triumph*, *decimate*, &c. Also numerous English verbs were employed in many various senses, as *take* for to consider, to understand, to bewitch, to interrupt, to resort to, &c., *pass* for to surpass, to pass sentence, to assure, to care for, &c. There is a strong and sometimes excessive fondness for compound words and phrases, as *marble-constant*, *furnace-burning*, *back-return*, *wind-changing*, *honey-heavy-dew*, &c. This tendency to strike out new words was often at variance with the nature of the language, as when a Latin ending was fastened to a Teutonic root, or *vice versâ*, *e.g.*, *bodement*, *increaseful*. The Renaissance led the Elizabethan prose-writers to imitate Latin authors, to frame long round periods, somewhat tangled and cumbrous, but showing a grandeur of phrase and rhythm novel in our literature; while the Elizabethan poets lent their style the charm of racy facile vigour by free recourse to the popular idiom, and played wild freaks with grammar, bending syntax to their whim, using adverbs as verbs, verbs as nouns, and nouns as adjectives—a daring laxity partly due to their wayward fancifulness, partly to the transitional state of the language. Their strange constructions are often experiments prompted by the loss of the old inflections, or are caused by the secret suasion of the old syntax. Compared to our present English, the Elizabethan is superior in freedom and terse strength, but inferior in clearness and correctness. Gradually syntax became more strictly observed, and as the Renaissance enthusiasm cooled, Latin and Greek words were less wantonly pressed into service. The authorised version of the Bible (1611) has done much to preserve many exquisite old English words, and has been an abiding influence for good on the English style. In the 18th c. the Teutonic element was sacrificed to the Latin, the result being a style generally heavy and pompous, but sometimes, as in Gibbon, full of a splendour that would be august if it were not artificial. In the present century, a healthy reaction has set in for Teutonism, which may, however, be likewise carried to excess.

English Literature. 450-1066.—The earliest E. L. in the vernacular consisted of songs of war and adventure, such as *Beowulf* (q.v.), paraphrases of Scripture, &c., which are treated of under ANGLO-SAXON LITERATURE. Alongside of these war-songs, hymns, and translations, there grew up a literature written in Latin by Englishmen and Welshmen, of which the chief specimens before the Norman conquest are the *Historia Britonum*, ascribed to Nennius, the *Epistola de Excidio Britanniæ* of Gildas, the *Annales Rerum Gestarum Ælfredi Magni*, commonly ascribed to Asser (q.v.) (but both the authenticity and genuineness of this work are now strongly challenged), the *Historia Ecclesiastica Gentis Anglorum* of Bede, and the *Colloquy* and *Glossary* of Ælfric. This learned literature was born in Northumbria and Strathclyde; but, on Wessex winning supremacy, flourished most abundantly in the S., where scholarship was especially fostered by Ælfred. At the Norman conquest literature in English was for a time crushed; while works in Latin continued to be written, and a foreign literature in French, produced mainly by Norman *trouvères*, arose. The 11th c. has few names of note. Among its leading authors are Osbern of Canterbury, who wrote a history from the creation to 1083, and Turgot, who composed a chronicle of Durham monastery. The 12th c. is prolific in names, but none are of high rank. The Conquest, besides for a time stifling English verse and prose, and introducing a French literature quite alien in style and theme from the first writings in English, permanently affected E. L. Rhyme, which certainly occurs in the old English hymns and sagas, and which may have stolen into English verse from Wales, was first popularised by the Normans, and drove out the ancient system of alliteration; while, instead of the old heroic poetry which sang of the deeds of Englishmen on the Continent and in England, long romances were woven celebrating the exploits of mythical and semi-mythical heroes. When the vernacular literature revived, the old national themes were forgotten, and Englishmen adopted subjects which the Normans had rendered familiar. The early heroic lays were thus hushed for ever, but the early devotional poetry was prolonged, though in humble form, until in the 13th c. we see in Ormin a genuine successor to Cædmon. The French literature, thus for a time dominant in England, was narrative rather than lyrical, being transplanted from the N. of France, the region of the *Chansons de Geste*. Compared to the English literature which it displaced, it was wanting in earnestness, fire, and energy, was more gay and shallow, with a novel fineness and quaint floweriness of style. This French nicety of diction ultimately blended with and toned down the rude strength of the early Teutonic verse, and imbued English poetry with a lightness and grace which it could not have developed from its original resources alone. Prose annals were plentiful during the 12th c., the chief chroniclers being Florence of Worcester, Eadmer, Orderic, Henry of Huntingdon, and William of Malmesbury. In the last a new historic spirit begins to dawn, shown by a tendency to weigh facts and look into the state of the rest of Europe; and healthy patriotism and independence glance out from Eadmer, Henry of Huntingdon, and the *Legend of Hereward*. In this century the *English Chronicle* ends with a dark graphic picture of the woes of King Stephen's reign, and the cycle of Arthurian romance is firmly ingrafted on our literature by the fabulous Latin history of Geoffrey of Monmouth, which first popularised the stories of Arthur and the Round Table, so often retold by our poets. Through the influence of Geoffrey's work, E. L. adopted a body of Arthurian and pre-

Roman legends, which despite its mediæval and fanciful colour, perhaps keeps some strangely-altered fragments of the history of W. Wales, mingled with wild stories created by Welsh and Armorican bards, and which unfortunately came to be viewed as sober truth, and blinded men to the real acts of the Teutonic settlers in Britain. In the 12th c. Alfred of Beverley recounted the Arthurian tales in the form of a genuine chronicle, and the *trouvères*, Gaimar and Wace, recast them in French verse. Towards the end of the century literature becomes secularised, a keen inquisitive faculty appears, and a political rather than a monkish spirit breathes through history. Satire and criticism spring up in the gifted Walter Map, in Nigel Wireker, whose *Brunellus* assails the monkish orders, and in Gerald de Barri, or Giraldus Cambrensis, the earliest English political pamphleteer. Ranulf de Glanvil writes the first work on English law, John of Salisbury gathers up the learning of the time in his *Polycraticus*, literary criticism is begun by Geoffrey de Vinsauf, and history is compiled by William of Newbury and Roger of Hoveden, who carry us into the 13th c. Meanwhile the vernacular literature maintained a lowly existence in the shape of homilies, translations, and other religious works, and in treatises on the knowledge of the times. The 13th c. is an age of fresh intellectual activity, of ardent zeal for learning—a fleeting and premature foreshadowing of the Renaissance. New ideas and a more liberal culture were diffused by the Moors of Spain and by the influence of the Crusades; the splendours of Oriental fiction were wafted from the far East, and the rudiments of science stole in from the schools of Cordoba and Granada. The English universities began to affect literature, and Latin was zealously studied. Adelard of Bath introduced the elements of science from Spain; Roger Bacon reflected the rebellious spirit of inquiry which was abroad, and sought to embody the encyclopædic idea of knowledge which was then arising; Robert Grossetete was the foe of the Pope, and forerunner of Wickliffe; and William Occam was the trenchant assailant of scholastic Realism. History became filled with a patriotic spirit in Roger of Wendover, and Matthew Paris, who is the best of the monkish chroniclers. Long French romances of Arthur and Charlemagne, of Havelok and King Horn were abundantly produced, often based on Scaldic or Saracenic tales, and tedious from their fluent minuteness. But the great feature of the century was the revival of English as a literary tongue in the *Brut* of Layamon; the English history of Robert of Gloucester, where the patriotic English spirit shines out brightly; in the *Ormulum* of Ormin or Orm; and in the *Handlyng Sinne* of Robert of Brunne, written about 1300. These works are mostly of linguistic rather than of purely literary value, the finest poetry of the time blossoming forth in the short English lyrics and ballads, sweet and simple verses, lit with a quaint tender passion, tinged with a charming love of nature, and blending the old Teutonic strength with French grace and refinement. Such a union of qualities is seen in the *Owl and the Nightingale*, a true English *fabliau* written in the reign of Henry III. New rhythmical forms are introduced, and octosyllabic verse becomes a favourite medium for narrative. Many of the ballads cluster round the favourite hero Robin Hood, and similar outlaws. The 14th c. is a time of great political and religious movement, the age of Lollardism and the peasant wars. The inquiring spirit which awoke in Walter Map becomes bolder and more democratic, and English completely overthrows French as the literary speech of the land. Lyrical poetry still blooms, pleasantries like the French *fabliaux* are numerous, and the brooding earnestness of the pre-Norman literature reappears in severe homilies, such as Richard Rolle's *Pricke of Conscience* (about 1340), and Dan Michael of Northgate's *Ayenbite of Inwyt* (about 1350). Laurence Minot's war-songs (about 1360) echo the national pride in the victories of Edward III. The chief writers of the century are William Langland, John Wickliffe, John Gower, Sir John Mandeville, and Geoffrey Chaucer. Langland, in the satire *Piers the Plowman*, gives voice to the misery of the people, and mirrors the dark side of the age, while its brilliant aspect is reflected in Chaucer. Two streams of poetry unite in Langland's work—the satiric, which began in the 12th c., and the religious, which began with Cædmon. Wickliffe translates Scripture into racy, homely English, and spreads the Lollard reform. Gower writes huge allegorical poems full of learning. Mandeville is, next to Sæwulf, our earliest great traveller, and, along with Wickliffe and Chaucer, may be called the father of modern English prose. Chaucer is our first great poet, and his works are the crowning flower of the playful satiric, and amorous mediæval poetry which takes a frank interest in human character and daily life, as distinguished from the mystic mediæval poetry, of which the loftiest representative is Dante.

1400-1580.—After the death of Chaucer, the struggle with France, the Lollard controversy, the Wars of the Roses (1430-1485), and the Anglican Reformation, caused a literary decadence during the 15th and earlier years of the 16th c. Men were alienated from verse to polemics, and the best poetry of the 15th c. is found in the simple, forcible ballads of the North and Midlands. Most of the Robin Hood ballads, the *Nut-brown Maid*, and a version of *Chevy Chase*, belong to this period. The chief writers in verse of the 15th c. whose names we know are Occleve, Lydgate, and Hawes, who produced long, cold, and gaudy allegories. In the beginning of the 16th c. popular poetry revived in the boisterous Skelton, and the dawn of the English Renaissance is visible in the works of Surrey and Wyatt. They were imitative rather than original, but through their adoption of classic and Italian metres, such as the sonnet and the blank verse introduced by Trissino, and the sparkling, limpid fluency of their style, they helped largely to adorn and chasten the language, and bring in a more refined and ornate school of poetry. They are sometimes regarded as the fathers of 'subjective' poetry in England. As the century advances, the growing influence of the Renaissance and the rise of a new poetry are seen in such works as Tottell's *Miscellany* (1557) and Edward's *Paradise of Dainty Devices*, collections of moral pieces and love songs in the *Mirrour for Magistrates* (see SACKVILLE), and in the varied writings of Gascoigne. Comedy dawns in Udall's *Ralph Royster Doyster*, tragedy in Sackville's *Gorboduc*, and the historical play or history in Bale's *King John*. (For the rise of the English drama see MIRACLE PLAYS and DRAMA.) The increasing love of literature and interest in foreign works are shown by the number of translations, especially from the Italian, such as Painter's *Palace of Pleasure* (1563); and popular fiction underwent a change, the place of the Arthurian and other long chivalrous romances being taken, to a great extent, by tales from the Italian and new stories of English life. Among the English prose romances, 'the Waverley Novels of the 16th c.' are *The Six Worthy Yeomen of the West*, *Tom-a-Lincoln*, *George-a-Green*, *Robin Hood*, *The Seven Champions of Christendom*, &c. The chief prose writers of the period are, in history, Caxton, Fabyan, Lord Berners, Cavendish, Bale, Hall, Leland, Foxe, Hollinshed, Linacre; in polemics, Pecock, Fisher, Tyndale, Elyot, Coverdale, Cranmer, Latimer, Ridley, Gardiner, Pole, Foxe, and Jewell. The *Paston Letters*, the correspondence of the Paston family from 1420 to 1505, give valuable social details. Perhaps the finest prose of this period is Sir Thomas Mallory's (see MALLORY) *Morte d'Arthur* (1485), but in the 16th c. we see clearly, in More and Ascham, the dawn of a new prose style. In 1470 Caxton introduced printing, but the art did not give a powerful impulse to literature until the Elizabethan era. This period was rife with change, the systems of chivalry and feudalism vanished, the Church was revolutionised, thought was freed from scholasticism, and the new learning flowed into the country, where it was diffused by writers and scholars such as Cheke, Colet, Grocyn, Linacre, Warren, Ascham, and More. (For the English translations of the Bible belonging to the period see BIBLE.)

1580-1625.—This period, known as the Elizabethan, is the golden age of E. L., rich in poetry and prose, in imaginative and speculative writings. It is peculiarly the palmy epoch of the English drama. Its greatness was especially due to the Renaissance powerfully stirring the English mind at a time of splendid national progress, of victory and discovery, of patriotic and religious awakening. Instead of meeting with an emasculate society, and flowing into sculpture and painting as in Italy, the Renaissance in England found a people in unprecedented national vigour, and was centred wholly upon literature. The invention of printing was now bearing fruit, maritime discovery kindled the poetic imagination, and England's attitude as the defender of Protestantism heightened patriotic enthusiasm. The new literature is broadly distinguished by its keen interest in human action and passion, and by the extent to which it is affected by Italian writers. This Italian influence takes two forms—on the one hand flushing the Elizabethan narrative and love-poetry with a Southern affluence of lovely colour, and instilling a fondness for soft melodious verse, while on the other it leads the dramatists to choose their themes from the blackest episodes in Italian tales and annals. The principal dramatists were Peele, Greene, Marlowe, Lodge, Kyd, Munday, Chettle, Nash, and, immediately succeeding these, Shakespeare, Jonson, Beaumont, Fletcher, Dekker, Webster, Ford, Chapman, and Massinger. The Elizabethan drama is unrivalled for grandeur, comprehensiveness, and variety, revealing the keenest insight, and the most lavish fancifulness, the most aërial sublimities, and the most grotesque incidents, grappling with the deepest problems of life, and revelling in the wildest sallies of wit. (See DRAMA.) Of non-dramatic poets the greatest is Spenser, whose glowing colour, sweetness of verse, and taste for allegory were imitated by Sidney, Harrington, Daniel, Drayton, Sylvester, Chapman, Giles and Phineas Fletcher, and William Browne. Long narrative poems, dealing with English legend, history, and scenery, were written by Daniel, Drayton, and Warner; metrical satire by Donne and Hall; and lyric poetry was exquisitely developed by the dramatists. Pastorals, imitative of Italian poetry, were written by Spenser, Fletcher, Drayton, Jonson, Browne, &c.; sonnets and love-songs abounded. Throughout this poetry there runs a love for fantastic conceits and strained refinements, which, arising from Euphuism, a natural growth of the Renaissance popularised by Lyly, and chiming with the courtly taste, disfigures the writings even of the greatest dramatists, and becomes the chief feature of English poetry in the first half of the 17th c.

The chief Elizabethan prose-writers are, in history and scholarship, Foxe, Stowe, Speed, Camden, Raleigh, Spenser, Hooker, Bacon, Burton, Usher, and Selden; in science, Bacon, Napier, Harvey, and Lord Herbert of Cherbury; in controversy, Whitgift, Cartwright, Robert Brown, Nash, Donne, and Hall; in fiction, Greene, Lyly, Sidney, and Bacon. The prose is for the most part stately and periodic, as in Hooker, but is also, in the euphuistic writings of Lyly, Greene, and others, antithetic and full of conceits.

1625-1688.—From 1625 to 1640 E. L. held its Elizabethan characteristics; Jonson, Marston, Massinger, Ford, and Shirley were active as dramatists; and, though the Puritanic hatred of the theatre was strengthening, as shown by Prynne's *Satiromastix* (1632), plays, and especially fantastic pieces called *masks*, were highly popular. The pastoral and allegorical poetry, founded by Spenser, was continued by William Browne, and Giles and Phineas Fletcher; and the early poems of Milton, which belong to this time, breathe the Spenserian spirit. The taste for intellectual subtleties and far-fetched analogies, which the Elizabethans borrowed from Italy, became more conspicuous in the verse of Habington, Henry More, Crashaw, and Cowley, who was now beginning his poetic career; vigorous metrical satires were composed by Jonson, Hall, Davenant, Wither, and Cleveland; charming love-songs, anacreontics, and epigrams, full of sportive grace, and tripping music, were written by Jonson, Wither, Carew, and Herrick; and prose, for the most part retaining the Elizabethan intricacy of style and wealth of classic allusions, was represented by Donne, Usher, Jonson, Selden, Burton, Herbert of Cherbury, Wither, and Chillingworth. From 1640 to 1660 literature, excepting polemics, was almost silenced by the civil wars and subsequent Puritan rule. The closing of the theatres by the Puritans in 1642 put an end, for a time, to play-writing, and the higher prose was almost stifled by a vast outcome of pamphlets for and against the king—Presbyterian and Independent, Cromwellian and anti-Cromwellian—Milton plunging into the controversy, and vindicating the Roundheads in gorgeous polemical treatises. The chief prose writers were—in philosophy Hobbes, and Sir T. Browne; in theology, Jeremy Taylor; in history, Clarendon and Fuller; in polemics, Milton, Laud, Hall, Prynne, Fuller, and Whitlocke. Excepting parts of the works of Davis, Marvell, Denham, Davenant, and Wither, verse was confined to Cavalier songs and lampoons on Royalists and Roundheads, the ablest of such song-writers and satirists being the Royalist Cleveland. The Restoration, in 1660, suppressed controversial writings, restored the drama, and introduced a new literature, deeply marked by French influences, by profligacy, scoffing wit, and a strong anti-Puritan bias. Only a few writers held aloof from the general tendencies, notably Milton, who now returned to poetry and wrote his great epics; Butler, who flouted Puritanism in the style of the conceit-writers; and Cowley, who continued to weave subtle frigidities into serious verse. Mainly through the influence of Dryden, a new poetry arose, modelled on the French critical school, which, under Boileau's guidance, had crushed euphuism in France; English verse, stripped of conceits, became more direct, simple, and mechanical; and brilliant didactic energy took the place of idealism and imaginative fervour. Rhyming tragedy was imported from France, and Dryden sought vainly to found a new drama uniting Elizabethan fire with French symmetry of form. The chief writers of tragedy were Dryden, Lee, Crowne, and Otway. Romantic plays had vanished; but comedies of city life, coarsely broad, but glittering with wit, were written by Congreve, Wycherley, and Vanbrugh, a purer drama at last arising with Farquhar. Verses of society, sometimes with a pleasant *naïveté* in their florid badinage, were composed by such noblemen as Dorset, Sedley, and Rochester.

The influence of French literature on the prose of the period produced a more correct and elegant syntax, the chief prose writers being, in philosophy, theology, and polemics, Hobbes, Browne, Taylor, Cudworth, Barrow, Tillotson, Sherlock, South, Leighton, Pearson; in scholarship and history, Clarendon, Aubrey, Evelyn, Pepys, Dugdale, Rushworth; in fiction, essays, criticism, &c., Dryden, Cowley, Walton, and John Bunyan.

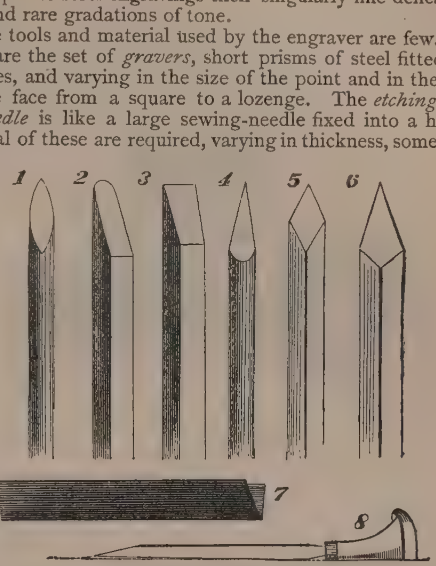
1688-1788.—This period, from the English Revolution to the French Revolution, may be called the period of the 18th c. It is markedly an age of great prose authors, none of our very best poets, but many of our foremost prose writers, belonging to it. In the early part of the century satires and pamphlets were abundant, and during Queen Anne's reign literature became mainly a party tool, the chief writers enlisting with Whigs or Tories, and receiving preferment for their services. The principal poets of the first half of the century were Arbuthnot, Gay, Swift, Pope, Phillips, Prior, Young, Warton and Thomson. The poetry of this era, known as the English 'Augustan' age, is distinguished by fastidious metrical art, displays the perfection of polished verse, but wearies by the sameness of its cadences, and the absence of true passion and spontaneous grace. It was largely didactic, was mainly devoted to satire and pictures of town life, having lost the aroma of the country, and was cast almost wholly in the heroic couplet, which in the hands of Pope, the master-poet of the time, constantly sparkles into jewels of epigram. The chief prose writers in the beginning of the period were Bolingbroke, Locke, Swift, Berkeley, Butler, Addison, Steele, and Defoe, the writings of the last three clearly marking the decline of patronage and the revival of popular influence. In place of the many-linked, sonorous prose of the 17th c., a lighter, simpler style was adopted; Defoe and Swift writing with racy vigour, Addison and Steele with careless, idiomatic grace. Comedy died out before realistic prose fiction, which was admirably developed by Defoe, Swift, Richardson, Fielding, and Smollett; and afterwards received a more graceful and idyllic, though less robust, treatment from Sterne and Goldsmith. To the second half of the century belong several of our noblest monuments of history. Prose became heavily Latinised, more precise and ornate, and more stately in rhythm than Addison's or Steele's in the works of Johnson and Burke, and of the historians Gibbon, Robertson, and Hume; while Goldsmith united the polish and accuracy of the Johnsonese with the graceful abandonment and lighter structure of the Addisonian style. The chief writers in philosophy were Hume, Paley, and Adam Smith. The foremost poets were Gray, Goldsmith, Shenstone, and Collins, who partly clung to the 'Augustan' manner, partly broke away from it in lyrics and idylls, which, despite their artificiality, show true fervour and delicate pensiveness; Blake, a strange mystical genius; and, above all, Cowper and Burns, in whom natural and impassioned poetry revived. During the latter part of the century authors lean again upon the public, patronage decays, periodical criticism arises, and the newspapers gain vastly in power, and usurp the functions of the political pamphlets.

1788-1894.—This period is second only to the Elizabethan for the number and splendour of its names. The chief poets of its earlier years were Byron, Shelley, Keats, Coleridge, Landor, Wordsworth, Scott, Moore, Crabbe, Campbell, Rogers, Southey, Wells, and Leigh Hunt. Many of these writers, deeply moved by the French Revolution, filled their verse with stormy passion, fiery rebellious protests, and a kind of nature-worship partly borrowed from Rousseau; while others led a strong reaction against the poetic style of the Queen Anne writers. Romantic poetry revived, new metres were adopted, Gothic and Eastern tales displaced the old 'classical' themes, lofty philosophic musings were cast into verse, and nature was described with novel subtlety of insight and freshness, novel energy, and felicity of language. The chief prose writers in fiction, philosophy, and criticism were Scott, Coleridge, Southey, Bentham, Mill, Godwin, Stewart, Galt, Miss Austen, Jeffrey, Wilson, Hazlitt, Lamb, Leigh Hunt, Landor, De Quincey, &c. Gradually the revolutionary glow faded from poetry, and at length a new school was founded by Tennyson. The greatest Victorian poets are Tennyson, R. Browning, Mrs. Browning, Hood, Arnold, Taylor, Dobell, 'G. Eliot,' W. B. Scott, D. Rossetti, C. Rossetti, Morris (2), Swinburne, Austin, and E. Arnold. There seem at present to be signs of the dawn of a new lyric and dramatic school. (See DRAMA.) Of prose writers, recent or living, the chief are, in history, Hallam, Alison, Macaulay, Carlyle, Grote, Thirlwall, Merivale, Milman, Buckle, Finlay, Stanley, Helps, Kinglake, Burton, Froude, Stubbs, Freeman, Greene, Stephen, Kitchen, Walpole, and May; in biography, Forster, Lewes, Masson, and Dixon; in philosophy and science, Hamilton, Carlyle, J. S. Mill, Newman, Maurice, Bain, Kelvin, Spencer, Tyndall, Huxley, Darwin, and Maxwell; in criticism, De Quincey, Ruskin, Arnold, Carlyle, J. Morley, Swinburne, Archer, Escott; in fiction, Lytton, C. Brontë, Disraeli, Dickens, Thackeray, 'G. Eliot,' Kingsley, Trollope, Reade, W. Collins, Black, Blackmore, Mrs. H. Ward, Stevenson, Caine, Hardy, Mallock, Meredith, C. Doyle, Buchanan, Miss Braddon, Burnand, &c.; in religion, Liddon, Martineau, &c.

Engra'ving (Gr. *en*, 'in,' and *graphō*, 'I write'), the art of inscribing figures, letters, or ornaments on surfaces of metal, wood, or stone. E. is usually practised either for ornamentation or for printing impressions from the incised lines. E. on stone, as distinct from lithography, belongs to the first class, and is known as sculpture or stone-carving, and ornamental E. on wood is termed wood-carving. The production of engravings on wood (woodcuts) for the transfer of impressions to paper is designated wood-E. Ornamental E. of metallic surfaces is called chasing. The term E. is principally applied to the art of engraving pictures on copper or steel plates. In the higher ranges of the art fine instinctive touch and pure artistic feeling are as necessary as technical or manipulative skill. Here, however, we have only to do with the technical aspect of E.

In printing from types, stereotype plates, or woodcuts, it is the elevated portions which receive the ink and transfer their impressions to paper; but with engraved copper or steel plates the case is exactly reversed, and it is into the incised lines or dots that the printing ink is placed, to be brought in contact with the paper by pressure. The breadth and depth of the incised lines, therefore, determine the boldness of the impression, and it is this circumstance that gives to copper or steel engravings their singularly fine delicacy of line and rare gradations of tone.

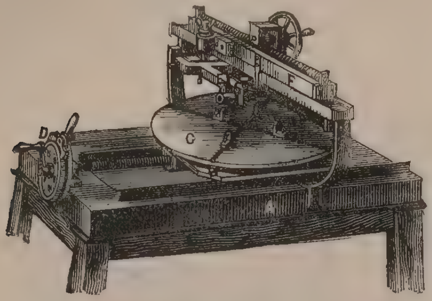
The tools and material used by the engraver are few. The chief are the set of *gravers*, short prisms of steel fitted into handles, and varying in the size of the point and in the form of the face from a square to a lozenge. The *etching-point* or *needle* is like a large sewing-needle fixed into a handle. Several of these are required, varying in thickness, some being oval-shaped to produce the broader lines. The *dry-point*, similar in shape to the etching-point, is used for more delicate lines, and differs in its effect from the graver by not taking the metal clean out, but throwing it up on each side. The *scraper* has three fluted sides, and is used to remove the barb left by the action of the graver, needles, or dry-point. The *rubber*, a roll of cloth dipped in oil, smooths the surface. The *burnisher* is employed to erase any scratches, to polish and soften any parts engraved or bitten in too dark. The engraver also uses a *bridge*, or thin board for raising his hand above the level of the plate, and a *blind* of tissue paper to direct light on the plate. The different styles of E. on metal plates are known as etching, line E., mezzotint, and aquatint.



Tools for Wood Engraving.

1, Elliptic; 2, Gouge; 3, Chisel; 4, Tint; 5, Lozenge; 6, Graver; 7, Tool for pine; 8, Tool in handle.

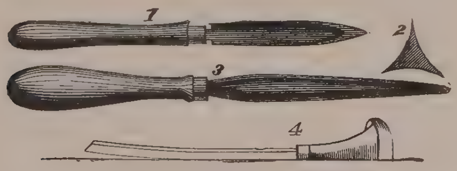
In etching, the plate of copper is first covered with a composition known as *etching-ground*, capable of resisting the action of aquafortis. It consists of black pitch, white wax, burgundy pitch, asphaltum, and gum mastic, mixed by firing. A pencil drawing of the subject on paper is then placed face down on the plate, and transferred by being passed through a press. The workman with his points or needles follows the lines of the drawing, removes the ground, and thus exposes the part of the plate covered by the drawing. A wall of wax is put round the plate, the acid is poured on and left till it has *bitten* deep enough, when it is washed off. Those parts which are corroded enough are covered with a *stopping ground* of lamp black and Venice turpentine, and the acid is again applied, this being repeated till the required depths are obtained. Steel plates, owing to their hardness, require a different biting agent, consisting of a mixture of pyroligneous and nitric acids and water, after the application of which the plate is carefully dried to prevent rust. In *line E.*, so called from the effect being produced by lines of different thicknesses running more or less parallel, the plate is first etched and afterwards finished with the graver, or it may be solely cut by the graver or dry-point. The former is the method usually employed now. Line E. produces the best work, and occupies the foremost place in the art of E. A ruling machine, which produces parallel lines with great rapidity, is frequently used, but its effects are inferior to those produced by handwork. *Mezzotint* differs considerably in appearance from any other style, and is not so difficult work as line E. The ground is carefully indented all over by an instrument called a *cradle*, having a serrated edge, the parts requiring lightness of shade being smoothed with the scraper and burnisher, those parts left untouched giving the deepest shades. Sometimes the design is first etched on the plate. In *stipple E.* the plate is first covered with the etching ground, and the design transferred in the usual way. The outline, instead of being drawn in lines, is put in by dots, wide or near, as light or dark shades are required; it is then bitten with the acid, and finished off with the graver. *Aquatint E.* is the most difficult of any of the styles, and is now superseded by lithography. The plate is covered with a ground of rosin held in solution by spirits of wine, which on drying leaves a granulated surface. The drawing being transferred, those parts requiring the highest lights are 'stopped out' before exposing the plate to the action of the acid, which eats through the granulated ground. This process is repeated as each portion becomes of the desired shade, as many as ten or more separate bites being sometimes required. On paper the aquatint, consisting of flat washes, is like a drawing in India-ink.



Ruling Machine.

A, Foundation; *B*, Bed plate; *C*, Revolving plate; *D*, Feed wheel and screw; *F*, Carriage; *G*, Wave roll.

Plate-printing is very simple. The plate is first slightly heated, and the ink rubbed in with a linen rag; the face is then cleansed, and the workman rubs off the surplus ink with his hands, which he first covers with whiting. This requires to be done with great care. Damped paper is placed on the plate and covered with blanketing; it is then passed between the cylinders of the press—being raised or lowered by means of a lever—which are turned by a large star handle. The first copies, termed *proofs*, are the finest impressions, as the rubbing of the plate tends to erase or smooth the lines. After a certain number are taken the plate requires to be re-cut. By a valuable process, termed *acierage*, an engraved copperplate may now be protected with steel. It was invented by Garnier, and introduced from France by Joubert. By means of electricity an infinitesimally thin skin of iron is deposited upon the copperplate, which may be removed and replaced by a new deposit. See the works of Georges (Par. 1862); Ottley (Lond. 1816); Passavant (Leipz. 1860-66); Bartsch (21 vols. Vienna, 1803-21); Bryan (Lond. 1858); Hamerton (1866).



Steel Engraver's Tools.

1, Scraper; 2, End view of Scraper; 3, Burnisher; 4, Burin.

Engravings, Copyright in.—The right of property in engravings is for twenty-eight years from the date of publication, which date, with the name of the artist, must be inscribed on the plate. A purchaser of an *original* plate may lawfully print from it. To photograph an engraving is an infringement of copyright. To possess an engraved plate for imitating the notes of any bank, or to print from it is felony.

Engross'ing (Fr. *engrossir*, 'to increase'), in law, is the purchasing of victual at a fair or market, or of corn in the field, with the view of reselling at an advanced price. E. was at one time criminal in England, under statutes repealed by 12 Geo. III. c. 71. It was then found that E. was an offence at common law; but statute 7 and 8 Vic. c. 24, called an act for abolishing the offences of forestalling, regrating, and E., and for repealing certain statutes passed in restraint of trade, did away with the offence of E. altogether; so that any person (provided he be otherwise permitted) may purchase anywhere commodities with a view to sell them again at a profit.

Enharmon'ic In'terval, in music, a small interval between a pair of notes which go by one name but which differ slightly with the key of the music. Thus suppose a note to vibrate 768 times per second, and to be the tonic of a piece of music, the supertonic, a whole tone above it, will vibrate $\frac{9}{8}$ times as fast, or 864 times per second. If, however, the given note be the Dominant (q.v.), the next note above it in the same scale, the superdominant, will vibrate only $\frac{10}{9}$ times as fast, or $853\cdot\dot{3}$ times per second. Upon such instruments as the piano these two notes are represented by one only, but with the human voice, the violin, &c., they can easily be distinguished. The interval between them—having in this case the vibration ratio $864 : 853\cdot\dot{3} = 81 : 80$, and being therefore equal to a Comma (q.v.)—is one of the most common examples of enharmonic intervals.

Enkhuiz'en ('Narrow houses'; in Lat. *Enchusa*), a decayed town of N. Holland, on the E. shore of the Zuider Zee, 20 miles E.N.E. of Alkmaar. It has a fine townhouse, a cannon foundry, and some shipbuilding, &c. E. was formerly a place of 40,000 inhabitants, with a large herring-fleet, but the silting up of the harbour led to its decline. Paul Potter was born here in 1625. E. was founded in the beginning of the 13th c. Pop. 6332.

Enlist'ment in the Army, Law Regarding. By the Army Enlistment Act of 1870 (slightly modified and re-enacted by the Army Act) no one can be enlisted as a soldier for longer than twelve years. The Act provides that enlistment shall be either for the whole of the said period in any service, or for a portion thereof, to be fixed from time to time by the Secretary of State, and specified in the attestation paper, in army service, and for the residue of the period in the first-class reserve force established in 1867. But it is provided that the Act of 1870 shall not interfere with her Majesty's power to enlist men for a shorter period than twelve years. The Secretary of State is empowered from time to time to make general or special regulations, varying the conditions of service, so as to permit a soldier who has served for not less than three years to enter the reserve force for the residue of his term of twelve years. The Act makes provision in case of imminent national danger or of great emergency. If an apprentice enlist, his master may recover him under the Army Act. Every recruit must appear before a magistrate and declare that he enlists willingly; this attestation was to prevent a man being entrapped or empressed, and dates from 1694. If he repent of his engagement with the recruiting officer and decline to become a soldier, he, having received no pay, cannot be arrested or compelled to pay smart money (£1) as used to be the case; but if he attest, and afterwards desire to get off his engagement, then he must pay £10 within three months of E. Servants enlisting before the expiration of their engagement may be held to be validly enlisted under the Army Act. Aliens may be enlisted, but only in the proportion of 1 to every 50 natural-born subjects (see Army Act). No alien so enlisted can become an officer. Natives on the W. coast of Africa and Lascars in the E. Indies may, however, be recruited in any reasonable numbers for services in the W. Indian regiments and E. Indian service respectively. Of course every naturalised British subject may be enlisted in the British army.

Enlistment, Naval, Law Regarding.—By 16 and 17 Vic. c. 69 the compulsory service of seamen extended to ten years; it has now been provided that service, after first joining or re-entrance, should be ten years in place of five; and by

47 and 48 Vic. c. 46 it is provided that boys of 18 should be entered for service for 12 years and those under 18 for no longer service than beyond their 30th year; after which they may re-enter. The new service is to be in accordance with the regulations of the Admiralty. The bounty has been abolished, except money for first clothes. The Act 22 and 23 Vic. c. 40 provides for a reserve volunteer service (not to exceed 30,000 men) of five years in time of emergency. This force may be trained for twenty-eight days each year on shore or on board, and may be required to join any ship the Admiralty think fit. The corps may be called to actual service by proclamation. By 26 and 27 Vic. c. 69 the Queen may accept offers of merchant masters, mates, or engineers to serve in the Royal Navy, subject to rules framed by the Admiralty, and officers of the reserve may be enrolled in the Royal Navy. Men called out for training receive pay; if disabled in service, they are entitled to allowances; and if killed, their widows receive pensions.

Enn'is (Gael. *inis* or *innis*, 'an island,' also 'a meadow girdled by a river'), the capital of County Clare, in the province of Munster, Ireland, on the Fergus, 25 miles N.W. of Limerick by railway. The chief buildings are the court-house, the endowed and national schools, an infirmary, and a public library. A colossal white limestone statue of O'Connell, by Cahill, was erected in 1863. The Fergus is crossed by four bridges. E. has flour-mills, breweries, distilleries, and an active trade in grain, cattle, and limestones. Pop. of township 5460.

Enniscorth'y, a town of Wexford county, in the province of Leinster, Ireland, on the Slaney, 27 miles S.S.W. of Arklow by railway. It has a splendid church, a factory for frieze, flannels, and blankets, a large distillery, and a river-trade in coal, corn, timber, &c. The two parts of the town are linked together by a stone bridge. E. grew up around the castle of the Anglo-Norman invader, Raymond le Gros, which is still almost entire. Pop. of township 5648.

Enniskill'en (Gael. *Inis-Cethlenn*, 'Cethlenn's island'), the capital of County Fermanagh, in the province of Ulster, Ireland, on the Erne, 75 miles W.S.W. of Belfast. It stands near the S. end of Lower Lough Erne, and has manufactures of linen, strawplait, cutlery, whisky, leather, &c., and a trade in coal, provisions, and timber. It was founded by Protestant settlers, and received a municipal charter in 1612. It supported the Protestant cause in 1689. Here the troops of William III., 1500 strong, gained a signal victory over the forces of James II., consisting of 6000 men, 30th July, 1689. The famous regiment of the 6th Dragoons ('Enniskilleners') was originally recruited at E. Pop. of mun. bor. 5570.

Enni'us, Quin'tus, the father of Roman epic poetry, fondly styled by his countrymen *noster Ennius*, was born at Rudiæ, in Calabria, B.C. 239. He claimed descent from the ancient lords of Messapia, and is said to have served with distinction as a soldier, and risen to the rank of centurion. Cato the Elder on his way home from the African war met E. at Sardinia and brought him to Rome. During the Ætolian campaign he accompanied M. Fulvius Nobilior, by whose son's influence he afterwards obtained the rights of a Roman citizen. E. maintained himself by teaching the Greek language to patrician families. He died of gout, B.C. 169. By the desire of Africanus he was buried in the tomb of the Scipios. E. wrote, in eighteen books, the *Annales* of Rome in hexameter verse, besides dramatic and satirical compositions. His style is necessarily rough, but the vigour of his verse won the admiration of Cicero, Horace, and Virgil. The works of E. are said to have existed as late as the 13th c., but only fragments now remain. Of the collections, the first is that by Robert and Henry Stephens (Par. 8vo, 1564); the best are those of Hessel (Amst. 1707), and Vahlen (Leipz. 1854).

Enns, a picturesque river of Austria, rises in the S.W. of Salzburg, in the Noric Alps, and flows S.E. by E., then N., entering Upper Austria (*Ober der Enns*), which for 15 miles it separates from Lower Austria (*Unter der Enns*), and eventually joins the Danube, 11 miles S.E. of Linz, after a course of 160 miles, in part navigable.

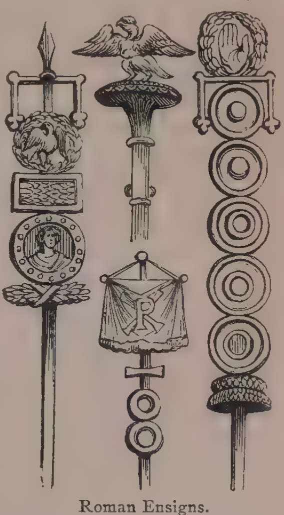
E'noch. 1. The eldest son of Cain.—2. The son of Jared, who 'walked with God: and he was not; for God took him,' at the age of 365 years (Gen. v. 18-24). This was understood by later Jews to mean that he was taken up to heaven without dying (Heb. xi. 5). Comparative mythology, however, professes to see in the history of E. an old myth about the year, which after 365 days is not. The name may be translated 'Renewal,' and his age, which is shorter than that of any of the other patriarchs, is exactly as many years as there are days in a solar year. This interpretation is curious, but not convincing.

Enoch, Book of, one of the principal of the Old Testament Apocryphal books, written, according to the best authorities, in Hebrew, wholly or in part, about a century before Christ, was widely circulated, and exercised a great influence during the first Christian centuries. From the time of Augustine (354-430), however, it was only known in fragments till 1773, when an Ethiopic version (probably made from the Greek version known to the early Fathers), in three MSS., was brought from Abyssinia by Bruce the traveller. The author gives elaborate descriptions of the world of spirits, of the future life, of the Sheol, with its different divisions, the place of the wicked and of the fallen angels, of the person and times of the Messiah. A great deal of the language of the New Testament—in Christ's discourses, the Epistles, and the Apocalypse, especially that describing the judgment of the last day—seems to have been derived from the B. of E. A translation was published by Archbishop Lawrence in 1821, as well as an edition of the Ethiopic text in 1838. The best edition is Dillmann's (1851). Among special works on the subject are those of Ewald (1854), and Philippi (1868).

En'sign (Fr. *enseigne*, Lat. *insigne*, 'a mark, or flag,' from *in* and *signum*), the generic name for a flag used as a signal, is specifically employed to designate the large flag that floats at the gaff of a ship when under sail, and above the poop when at anchor. Since 1864 all British ships of war carry the St. George's E., a white flag with a large red cross and a small union-jack in the left-hand upper quarter. The red E. with union-jack is used by transports, &c.; the blue in the merchant service.

Ensign, properly *E.-bearer*, was formerly a commissioned officer of the British army, called into existence for the discharge of a special office. The E. was the bearer and defender of the regimental colours; and when battles were decided by a series of hand-to-hand encounters, his office was one of honour and responsibility. The colours are now kept by the colour-sergeants. The junior subaltern rank is now that of 2nd-lieutenant instead of E.

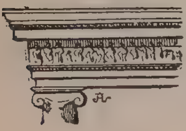
Ensign, a military standard, consisting of an upright staff surmounted by a device, peculiar to the nation or monarch to whom the ensign belonged. The Roman E. consisted of a pole with a metal eagle fixed to the top, while that of the Roman Empire after the time of Constantine, in place of the eagle, was decorated with some emblem of Christ.



Roman Ensigns.

Ensilage. Green herbage converted into fodder for animals by means of storage in pits. It is now being much used by stock-keepers, and is most wholesome for all kinds of animals, and valuable both as a milk-producer and meat-former. The method of formation is as follows:—The herbage is cut when in full bloom, and may consist of almost any green vegetable matter that is wholesome and nutritious for animals when green. The crops which make the best quality of ensilage are grass, clovers, rye-grass, vetches, maize, lucerne, trifolium, and oats. The two latter must be cut before they come into bloom. The herbage when cut is called *silage*, is carted at once to the pit or out-building where it is to be made—which is called a *silo*. It may be chopped into lengths of two or three inches long, or it may be put in unchopped. It matters not if it is stored wet or otherwise, but it is a *sine quâ non* that it is placed in the silo full of sap, without being withered by the sun or wind. The great point is to use sufficient pressure to keep out the air and regulate fermentation. As a rule, two hundredweights to the square foot is found sufficient. When the ensilage is taken from the silo, it is of a greenish-brown colour, and has a very strong smell, much resembling a newly emptied beer-cask. It is passing strange that, although the silo has been used in foreign lands by benighted nations from almost the beginning of time for preserving crops, it has been so long overlooked in Britain. The greatest advantage to the farmer in making ensilage is that he can defend himself against rainy and untoward seasons.

Entab′lature, in classical architecture, is the superstructure which lies horizontally (like a 'table'—from Fr. *table*) upon the columns, and which is divided into three sections—the *architrave*, which rests immediately upon the columns; the *frieze*, the intermediate space; and the *cornice*, the upper section. To each of the orders belongs a special E. of its own, the height and relative proportions of which are regulated according to a scale, the diameter of the column being the unit of measurement. Each of the divisions of the E. is in the different orders enriched with appropriate mouldings, facial, foliage, scroll-work, &c.



Entablature.

Enta′da, a genus of Leguminous plants, belonging to the *Mimoseæ*, or 'gum-arabic' group, and represented by the *E. scandens*, a climbing-plant of the W. Indies. These plants have pinnate leaves and large pods containing the seeds embedded in a glutinous substance. *E. pursætha* grows in the E. Indies, and its pods attain a length of from 4 to 5 feet long, containing beans or seeds of proportional size.

Entail′ (Fr. *tailler*, to 'prune'), a term in English and Scotch law. In the latter it is frequently called *tailzie*. By a deed of E. the legal course of succession to land is barred, and an arbitrary one substituted, the object being to preserve lands in one family, or in one portion of it. (See Donis, Statute de.) There are two kinds of entails—*general* and *special*. When lands are given to a man and the heirs of his body without restriction, this is called an estate tail general; but where there is a limitation to certain heirs, it is an estate tail special. There are also estates tail *male* and estates tail *female*. In the former the succession is limited to males, in the latter it is limited to females. Formerly tenants in tail in England used to evade the limitation by a process called a recovery (see Recoveries and Fines), but by the Act 3 and 4 Will. IV. c. 74 they can now make an effectual alienation by a deed enrolled in the Chancery Divisional Court. Under this statute an expectant tenant-in-tail may bar his own issue without the consent of the *protector of the settlement*, but an expectant tenant-in-tail in remainder requires that consent before he can bar either his own issue or those persons in remainder. And by 1 and 2 Vict. c. 110 an estate tail is rendered liable for the debts of the tenant; that is, the interest of the debtor in the property may be vested by the order of the court at once in the provisional assignee, but, of course, nothing can be done to the detriment of the expectant estate under a valid settlement. In Scotland various amendments of the law of E. were introduced by the Act of 1848, and subsequent amending Acts. By these Acts an heir of E. in possession is empowered to disentail an estate, in some cases without, and in some cases with, the consent of one or more of the substitute heirs. In entails dated on or after 1st August, 1848, an heir born *after* the E., being of full age, is entitled to execute a disentail under the authority of the court, without any consents. Born *before* the E., he may do so with the consent of the heir-apparent, which expression is defined by the Act to mean 'the heir who is next in succession to the heir in possession, and whose right of succession, if he survive, must take effect.' The heir-apparent, however, must have been born after the date of the E., and at the time of giving his consent must be twenty-five years of age, and of legal capacity. The Act of 1882 removed many of the restrictions on E. estates in Scotland. Under it, hardly any private land exists in Scotland at the present day which the owner for the time being cannot dispose of, should his title be any higher than a life-rent. It gives facilities for borrowing money for improvements, and empowers owners of estates to sell without the consent of the next heir, on obtaining a valuation of his interest in the estate, and paying the money into court.

Entell′us Monk′ey, a species of Catarrhine or Old World monkeys, distinguished by the last molar of the lower jaw possessing five tubercles. The E. M. is the 'sacred monkey' of the Hindus, and is protected by law.

Enter′ic Fever, commonly called **Ty′phoid Fever,** is one of the most fatal scourges of this country. It is a continued fever, associated with an eruption on the skin, occurring in crops, each spot continuing visible for about three days. The eruption occurs on the eighth or twelfth day, and varies much in degree. It is sometimes preceded by a very delicate scarlet tint of the whole skin, resembling the rash of scarlet fever, and consisting of slightly elevated papulæ, which may escape detection owing to the faintness of the colour, unless the skin be examined by passing the finger gently over its surface. The apices of the papulæ are invariably lens-shaped or rounded; they are circular and rose-coloured, and *they disappear completely on pressure*, and resume their characteristic appearance whenever the pressure is removed. The eruption is most common on the abdomen, thorax, and back. Each spot continues visible only for three or four days. This eruption, however slight, is absolutely diagnostic of E. F. The disease may be always recognised when there is *in the evening* a persistent elevation of temperature and a remission *in the morning*. In mild cases the disease continues at its height for a week or a week and a half; in severe cases it lasts from two weeks and a half to three weeks and a half. The period of abatement is irregular. The mean duration of E. F. is twenty-four days. The disease varies much in intensity, and is often accompanied by delirium from the first. E. F. ranks among infective diseases of a contagio-miasmatic character, the poison being a living organism, which, when transmitted from a diseased to a healthy individual, produces the same disease in the latter. By sanitary precautions, scrupulous cleanliness, the use of disinfectants, and the isolation of patients, the disease may be eradicated.

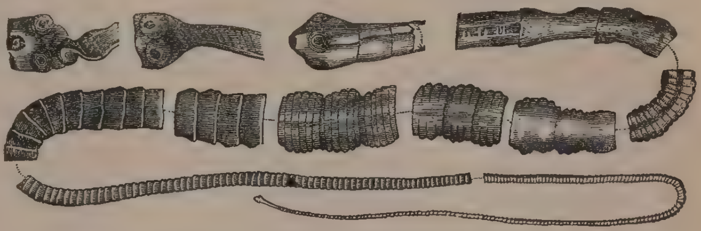
Enteri′tis, or **Inflamma′tion of the Bowels,** may attack the muscular or serous coats, and most frequently has its seat in the ileum. The chief seat of pain is the region of the umbilicus, or the right iliac fossa. E. is frequently confounded with cholera, a disease with which it has nothing in common, except abdominal pain and serous diarrhœa. E. may be caused by external injury, by poison, by irritating indigestible substances in the bowels, by cold, or by the action of other diseases, as enteric fever, cholera, dysentery, &c. When the causes are so diversified, no single mode of treatment can be indicated; but it is usually advantageous to administer a purgative of castor-oil, with an opiate for an adult, and to apply fomentations or turpentine stupes over the abdomen. The diet should consist entirely of arrowroot, sago, tapioca, gruel, barley-water, milk, and occasionally beef-tea. E. is a common disease amongst cattle, and should be treated on the same general principles. Aloes, or any purgative of an irritating nature, should never be given, but only oil and large clysters.

Entomol'ogy (Gr. *entomon*, 'an insect,' *logos*, 'a discourse'), the department of zoology devoted to the investigation of the habits, structure, and classification of Insects (q.v.). The special cultivation of E. was characteristic of a past era in zoology. The labours of naturalists are now limited not to the mere collecting and naming of species, but extend to the study of structure and development and of the relations of one species to another. The entomologist of the past was a mere collector of insect species. The entomologist of the present is a thorough general zoologist with a special aptitude for the investigation of the organization of the insect class. The study of the insect world necessarily becomes most attractive in view of the many uses which insects serve in the economy of nature, such as the fertilisation of flowers and the removal of decaying matter. But no less do the phenomena of Metamorphosis (q.v.), and of insect structure generally, offer subjects of the highest interest to the zoologist. The special study of E. dates from about the 17th c. Ray, Leeuwenhoek, and Swammerdam are the chief representative writers of this date on insects, and Linnæus also did much to promote the study. Latreille was an earnest investigator in E., whilst the famous writings of Kirby, Spence, and Newport bring us to more modern times. The Entomological Society of London devotes itself exclusively to the study of insects.

Entomos'traca (Gr. *entomon*, 'an insect,' and *ostrakon*, 'a shell'), a division of *Crustacea* represented by such forms as water-fleas (*Cyclops*, *Daphnia*, &c.) and other related organisms. The E., in modern acceptation, are aquatic animals, and possess a horny shell or carapace of one or more pieces. The gills are attached to the feet or jaws, and the limbs are jointed and provided with *setæ* or bristles. E. exhibit *ecdysis*, or moulting of their shells. The typical E. belong to the orders *Cladocera*, *Copepoda*, and *Ostracoda*. The latter group includes the common water-flea of fresh waters, which possesses a bivalve shell. The orders of E., which appear to possess a less evident relationship with the commoner forms, are the *Phyllopoda* or brine-shrimps, *Trilobita* or trilobites, and the *Merostomata* (soldier or king crabs), &c. The fossil species of E., chiefly forms belonging to the *Ostracoda*, &c., appear first in Silurian rocks. The Carboniferous rocks contain plenty of E.; and species still living are found in Mesozoic and Kainozoic strata, as *Cypris*, *Cythere*, and *Bairdia*.

En'tophytes (Gr. *entophuta*, from *entos*, 'within,' and *phuton*, 'a plant'), a name given to plants growing parasitically on animals—chiefly lower Fungi (q.v.) and Algæ (q.v.). Diseases of various kinds may be produced by the growth of vegetable parasites. Many caterpillars are infested by fungoid growths which kill these larvæ; and in *man* fungi appear to be the chief, if not the sole, causes of such skin and scalp affections as ringworm, &c. The term E. is also applied to plants which are parasitic on other plants, but it is used vaguely in botany. Many of the so-called E. are capable of producing serious disease in their plant-neighbours. Thus wheat is attacked by a low form of plant life named the *Uredo caries*, which attacks and wastes the wheat grains. Smut or dust-brand in corn is produced by the *Uredo segetum*, which destroys the inner parts of the flower. Another fungus (*U. rubigo*) produces disease in corn and grasses. The well-known Ergot (q.v.) of rye, wheat, and barley is supposed to result from the attack of a special fungus. The potato disease, through the researches of Worthington Smith and others, appears to be caused by a fungus (*Peronospora infestans*), the filaments of which emerge from the *stomata* or breathing-pores of the leaves, and produce seeds, which in their turn burrow into the leaves and perpetuate the disease.

Entozo'a (Gr. *entos*, 'within,' and *zōon*, 'an animal'), a term given to such animals as live parasitically in the interior of other animals. It was formerly used in a zoological sense, but is now discarded because of the heterogeneous assemblage of forms which this name brought together. As used in a general sense—the only way indeed in which the term E. can be used—this name indicates such animals as the tapeworms, flukes, roundworms, threadworms, and other animal organisms which reside permanently or temporarily within the body of man or of other animals. The most common habitat of E. is the digestive system. The tapeworms infest this system in their mature state, as also do the round and thread worms. They are also frequently found in the muscular system. While immature, many of the tapeworms in the form of cystic worms or *Scolices* select the muscular system as a resting-place. Some of these cystic forms inhabit the brain, liver, and other organs. The presence of an immature *Tænia* in the brain of the sheep produces 'Staggers' (q.v.), while the larval forms of another tapeworm in the liver of man produces the serious lesion known as *hydatids*. The common fluke has its seat in the liver of sheep, and causes the 'rot' of veterinarians. Certain peculiar forms of E. named *Hæmatozoa* occur in the blood of man and other animals; and, although still a matter of doubt, *Bacteria* and *Vibriones* may also be included as E., since they appear plentifully in morbid as well as healthy tissues. The great majority of E. belong to the class *Scolecida*, one of the divisions of the *Echinozoa* or *Annuloida*. Some insects, such as the larvæ of the bot-flies, are parasitic in horses and other animals during the earlier stages of their existence, and afterwards escape from the digestive systems, to pass in the ground their pupa or chrysalis stage. Some remarkable instances of *pseudo-parasitism*, named *commensalism*, have been related—fishes living in the stomachs of sea-anemones and of sea-cucumbers, and passing freely in and out of the bodies of their hosts. Certain pea-crabs are only known as parasites within molluscs, such as mussels, and sea-squirts or Ascidians. A pea-crab an inch long has been taken from the interior of a mussel-shell, and the same crabs have been seen to emerge from the bodies of sea-squirts in aquaria to seek for food, and again re-enter. Such animals are truly E. The history and development of E. bear an important relation to public health, since these parasites are capable of causing serious disease. (See TRICHINIASIS.) Preventive measures are examination of food and attention to cooking.



Common Tapeworm, with different views of the head.

Entr'act, a short piece of music between the acts of a play.

En'tre Dou'ro e Min'ho, or **Minho**, a maritime province in the N.E. of Portugal, lies between the rivers Minho and Douro, as its name implies, and is bounded W. by the Atlantic, and E. by Traz oz Montes and by the Spanish province of Orense. It includes the districts of Braga, Porto, and Vianna do Castello. It is famed alike for the rich beauty of its scenery, and for its rare fertility. In the E. it is entered by three hill ranges, which reach their greatest height in Monte Cavarra (7880 feet). Along the coast there is a fine stretch of undulating cultivated country. The chief rivers, besides those that form the N. and S. boundaries, are the Limia, Cavado, Ave, Neiva, and the Tamega, an affluent of the Douro. Among the productions are wine, oil, flax, maize, wheat, barley, oats, and Southern fruits. The province is noted for the excellence and quantity of its port-wines. Braga is the capital, and the chief towns are Guimarães, Caminha, Vianna do Castello, and Pavoa de Varzim. Oporto, included in Beira, is the principal harbour and place of trade. Area, 2807 sq. miles; pop. 1,091,936.

En'tre Ri'os (Sp. 'between rivers'), a state in the E. of the Argentine Republic, bounded W. and S. by the Paraña, E. by the Uruguay, and N. by the state Corrientes. It is intersected from N. to S. by a range of hills, but the plains are swampy, and are exposed to yearly floods. The chief occupations are cattle-rearing and hunting, and the exports comprise hides, horns, tallow, &c. The chief town is Concepcion. Area, 45,000 sq. miles; pop. 296,447.

Entro'pium (Gr. *en*, 'in,' and *trepō*, 'I turn'), a turning in of the eyelashes or eyelids against the eyeball, causing much irritation, and often inflammation of the cornea. Relief may be obtained by plucking out the cilia with the forceps, but a surgical operation is generally necessary.

En'try, Right of, a term of English law signifying the right of one who has been wrongfully ousted from land or from a tenement, through abatement, intrusion, or disseisin. No. R. of E. exists where a discontinuance or deforcement has taken place; for in either case the owner cannot enter, the previous entry being lawful; the owner is therefore compelled to bring his action. The entry, where a R. of E. does exist, is accomplished by a formal and peaceable entry upon the property, or part of it where the whole consists of separate portions in different districts of the *same* county, and by a declaration of the party entering that he takes possession. Under the Real Property Limitation Act of 1874, the action must be commenced within twelve years after the plaintiff became possessed of the R. of E. The limit used to be twenty years.

Entry of an Heir. In Scotch feudal law this term is applied to the recognition of the heir of a Vassal (q.v.) by the Superior (q.v.). On the death of the vassal the *Dominium Utile* (q.v.) returns to the superior, to be again given to the heir. The superior, however, is bound to grant a warrant for infefting (see INFEFTMENT) the heir pointed out by the charter in virtue of which the *dominium utile* is held by the superior.

Enure', a term of English law signifying to take place or to be available.

En'velope (Fr. *envelopper*, 'to wrap up,' formed from a root *velōp*, whose origin is unknown), a cover for letters or papers which has only come into common use since the introduction of the uniform charge for postage (1840). The consumption of envelopes is now prodigious. In his report for the year ending 31st March, 1895, the Postmaster-General estimates that the number of *letters* delivered in the United Kingdom alone was 1,770,900,000, or an average of 45·6 to each person. This estimate is quite apart from the numbers of postcards, circulars, and samples. Many ingenious machines have been devised for automatically performing the operations of cutting, folding, and gumming envelopes. In cutting out the blank shapes waste is avoided by using angular cutters or a cutting die on a pile of paper. The folding, embossing, and gumming are done by girls or machines. The most perfect E.-making machines are those of De la Rue, Poirier & Antoine, of Paris, and G. W. Reay, of New York, the latter performing all the operations of picking up single blanks, creasing, gumming, folding, and delivering, and requiring but one attendant.

En'voy (Fr. *envoyer*, 'to send,' from Lat. *in* and *via*, 'a way'), a person despatched on a mission, a diplomatic minister of the second order. E. extraordinary and minister plenipotentiary is the chief foreign representative of the United States. See EMBASSY.

E'ocene (Gr. *eōs*, 'dawn,' and *kainos*, 'recent'), the name given by Lyell to the series of strata at the base of the Tertiary formations, which contains among its fossils not more than 5 per cent. of existing species. It is subdivided into three great groups. 1. *The Lower E.*, forming the London basin, rests in apparent conformability upon the chalk, and comprises (*a*) the *Thanet Beds*, light-coloured quartzose sands; (*b*) the *Woolwich* and *Reading Beds*, a mixture of sands and clay; (*c*) *London Clay*, chiefly a dark-coloured clay containing nodules of ironstone. 2. *The Middle E.* consists of (*a*) the *Bagshot Beds*, light-coloured sands and marly clay; (*b*) the *Headon Series*, two groups of calcareous fresh-water deposits, separated by sandy strata of marine origin; (*c*) the *Osborne Series*, shelly sandstone and yellow limestone below, and light-coloured sands, clays, and marls above. 3. *The Upper E.* is divided into (*a*) the *Bembridge Beds*, pale-yellow limestone, capped by an oyster-bed and several beds of clays and marls; and (*b*) the *Hempstead Series*, dark, white, and coloured marls and clays. In the Brussels and Paris basins a very similar series of beds is found, and large masses of rocks belonging to the Middle E. are met with from the Alps along the Mediterranean shores, through Egypt to the Himalayas. In America there are two contemporaneous series, the Lignitic and the Alabama—the former furnishing a passage from the chalk to the true E. The traces of life in E. are of a tropical nature. The flora is especially rich in America, comprising cinnamon, fig, and melon trees, gourds, palms, conifers, &c. Among the fauna there is a large development of Gasteropods. Reptiles, such as turtles, crocodiles, snakes, are plentiful, and among mammals the *Pachydermata* are typical fossils. The more important divisions of the E. are treated under separate articles.

E'olis, or **Œ'olis,** a genus of Gasteropodous mollusca, of the family *Œolidæ*, section *Nudibranchiata*. They have no shell, the gills being on the sides of the body. They are found on our coasts, crawling over the stones at low-water mark like slugs, are usually of bright colour, and have the sides provided with flexible processes.

Eon de Beaumont. See D'EON, CHEVALIER.

Eötvös, Jozef, an illustrious Hungarian author, born in Buda, 3rd September, 1813, studied for the bar at Buda Pesth, after giving up all his means to pay his father's debts. Entering the public service, he at the same time cultivated literature with success. Dramatic writings, such as *The Critics*, a comedy, were followed by *The Carthusian* (1838-41), a sentimental philosophical novel. Several political essays on prison reform, Irish pauperism, and emancipation of the Jews, were the fruit of a tour through Europe. But the works of imagination by which E. is most endeared to his country and best known abroad are *The Village Notary* (Eng. trans. by Wenchstern, 1850), in which he ridicules the county institutions of Hungary; and *Hungary in* 1514, a story of the great peasant insurrection, the moral of which was that the nobles should surrender their feudal privileges in peace. E. ranged himself with the Centralist party of Deak and Batthyanyi, Von Pulsky and Kossuth. He wrote in the *Pesti Hirlap* in favour of equal taxation, &c. In 1848 he became Minister of Education under Batthyanyi; but conscious of practical incapacity, and perhaps afraid of the revolution, he retired to literary life in Munich, where he published a work on modern political ideas, a subtile pamphlet on the rights of nationalities. On the publication of the *Diploma* of 1860 and the *Patent* of 1861, E. once more cooperated with Deak in securing the Dual Constitution, which has given self-government and political strength to Hungary. In 1867 he became Minister of Education and Public Worship, and had to encounter very delicate problems of religion and language. He died 3rd February, 1871.

E'ozoön Canaden'se ('Dawn-of-Life Animalcule'), a most interesting organism, supposed to have been a large reef-building species of *Foraminifera*, the fossil remains of which occur in the Laurentian rocks of Canada and in contemporaneous strata in Europe. The E. derives its interest from its being the oldest known fossil of any kind, and, secondly, from the doubt which has been cast upon its fossil nature. The organic character of E. is denied by many palæontologists. Dr. Carpenter of London and Principal Dawson of Montreal —the discoverer of the E.—accumulated, however, such a mass of evidence in favour of the truly fossil nature of the E., derived from a study of existing *Foraminifera*, that the balance of probability is very greatly in favour of the E. being a true fossil organism. The E. consists of a series of chambers lying in tiers one above another. These chambers were occupied by the *sarcode*, a living matter seen in existing *Foraminifera*. Certain living members of the latter group (*Polytrema* and *Carpenteria*) grow in reef-like masses, and hence the reef-like nature and growth of the E. is further established. See Dawson's *Dawn of Life*.

Epacrida′ceæ (Gr. *epi*, 'upon,' and *akros*, 'the top'), a natural order of Exogenous plants in the sub-class *Corolliflora*, mostly natives of Australia, the Indian Archipelago, and the S. Sea Islands. They are shrubs or small trees, and are chiefly notable for their fine heath-like flowers, on account of which they are frequently cultivated in greenhouses. There are 31 genera and about 320 species, the principal one being the *Epacris*. The corolla is generally tubular; the fruit an edible berry or a capsule. The fruit of *Lissanthe sapida* is known as the *Australian cranberry*.

E′pacts (Gr. *epaktos*, 'additional'), were a set of numbers substituted for the golden numbers of the ecclesiastical calendar when Lilius carried out the reforms of Gregory XIII. in 1582. The golden numbers (marked with red letters) indicated the position of any particular year in the cycle of nineteen solar years, in which the difference of the solar and the lunar year is cancelled by the insertion of six intercalary months of thirty days, and the addition of one month of twenty-nine days. This cycle is supposed to begin with the 1st of January when the moon is new; and as this occurred in the year before the Christian era, the rule for ascertaining the golden number is:—Add 1 to the date, divide the sum by 19; the quotient is the number of cycles elapsed, and the remainder is the golden number. As, however, the lunar cycle was 1 hr. 29 min. longer than the actual length of 235 lunations, the new moons gradually began to anticipate the golden numbers at the rate of one day in 308 years. After Gregory corrected the excess of the Julian year, the system of golden numbers became unsuitable to the reformed calendar, and the epact was introduced to denote the age of the moon at the beginning of each year of the cycle of nineteen. This increases each year by the difference of the solar and lunar years, viz., eleven days; but every three years the epact is reduced by the thirty days of the intercalary month, except in the first year of the next cycle, when the twenty-nine days of the seventh additional month must be deducted. The E. are therefore 11, 22, 3, 14, 25, 6, 17, 28, 9, 20, 1, 12, 23, 4, 15, 26, 7, 18, 29. The solar equation, however, requires the diminution of the E. by one day three times in 400 years; while the lunar equation requires their increase by one day every 308 years. To avoid confusion, this latter correction is effected in a period of 2500 years, *i.e.*, once in 300 years for seven periods, and then at the end of 400 years. The two equations cancelled each other in the year 1800. A perpetual calendar requires thirty sets of E. In the Church calendar the epact 30 is represented by an asterisk, and epact 25 by an Arabic character, the others being in Roman numerals. If the golden number of a year be above 11, the epact 25 for six months of the year answers to the same day in the calendar as 26; otherwise, to 24. See CALENDAR.

Epaminon′das, the illustrious Theban soldier and statesman, was born towards the close of the 5th c. B.C., of a poor but noble family. In youth he displayed high intellectual aspirations, which were strengthened by his intercourse with several philosophers, especially Lysis the Pythagorean. E. remained in private life till 379, when he took part with his friend Pelopidas in the revolution by which Thebes was freed from the Spartan yoke. In 371 he represented Thebes in the general peace congress at Sparta, and opposed the ascendency of the latter with such spirit that Thebes was excluded from the treaty. Cleombrotus was dispatched against the Thebans, whom he encountered at Leuctra, 371, but his army was completely beaten by the skill of E., and the prestige of Sparta destroyed. In 369 E. and Pelopidas invaded the Peloponnesus, ravaged the country, threatened Sparta, founded Messene and Megalopolis, and restored the power of the Messenians, who had been most active enemies of Sparta. The victorious generals returned to Thebes to be impeached for retaining the command four months longer than the legal term, but were acquitted. In 368 E. made a brief inroad into the Peloponnesus, in which he took Sicyon and Pellene. In 366, after the 'tearless battle' in which the Spartans defeated the Arcadians, he returned thither, and without changing the existing oligarchies, accepted the Achaian cities as allies of Thebes; but the Thebans reversed his policy. In the same year E., serving as a private soldier, saved the Theban army sent into Thessaly to rescue Pelopidas, and afterwards, at the head of a second army, secured his friend's release. In 363 E. sailed to the coast of Asia with the fleet which the Thebans had equipped against Athens; and on his return from this fruitless expedition, he learned that Orchomenus had been destroyed, and that Pelopidas had been slain in Thessaly. The political complications of the Peloponnesus rendered Theban intervention again necessary, and in 362 E. invaded it for the fourth time. He attacked the enemy near Mantineia, and by renewing the tactics of Leuctra gained a complete victory, though he himself was mortally wounded. The surgeons declared that he must die as soon as the spear-head was withdrawn from his breast. They assured him that his shield was safe, and that Thebes was victorious; but when he learned that the commanders who should have succeeded him were slain, he said, 'You must make peace.' The spear-head was then withdrawn.

Epaule′ment (Fr. *épaule*, 'shoulder;' Old Fr. *espaule* and *espalle*, from the Lat. *spatula*, used by Apicius) is the shoulder-like 'flanking return' or terminal portion of a battery or earthwork. Its object is to secure men and guns against a flank fire or Enfilade (q.v.). The shoulder of a bastion placed at the point where one of the faces and one of the flanks of a fortified work meet is called an *épaule*.

Ep′aulette, a distinctive ornament worn upon the shoulder by naval and military officers. It is a relic of the plates that were introduced in the 14th c. as a defence for the shoulder from sword-cuts. The E. has not been worn in the British Army since 1855, but still forms part of the full-dress uniform in the Navy.

Epée, Charles Michel de l', born at Versailles, 25th November, 1712, became an abbé, but had to leave the Church on account of Jansenist opinions. He devoted himself to the education of deaf-mutes, and erected an institution for that purpose at his own expense (1760-65). He died 23rd December, 1789. The Constituent Assembly gave effect to E.'s request for a public institution in 1791. E.'s writings all relate to his method, embodied in *La Véritable Manière d'Instruire les Sourds et Muets* (Par. 1784). His *Dictionary of Signs* was continued by his successor, Abbé Sicard. Sicard also extended to syntax the system of signs which he had applied only to nomenclature.

Epei′ra, a genus of spiders (*Arachnida*) forming the type of a family, *Epeiridæ*, in which the jaws are widened from the base. The eight ocelli or eyes are arranged in a quadrangular fashion, and the skin is soft. The common garden spider, or cross spider, is a good example of this genus, as also is the two-horned spider. The former makes the well-known geometrical web, and is distinguished by the triple cross-marking on its abdomen. The females greatly exceed the males in size.

Eper′ïes, or **Eperjes** (Lat. *Eperesinum*, Hung. *Preschov*), the chief town of Sáros, Hungary, is picturesquely situated on the left bank of the Tarcza, 148 miles N.E. of Buda Pesth. It is walled, is the seat of a bishop, has six churches, a Lutheran college, manufactures of stoneware, linen, and cloth, and a trade with Poland in cattle, linen, and Tokay wine. Near E. is a royal salt-mine. E. was founded by King Geysa II. in the middle of the 12th c. Pop. 10,371.

Éper′nay (Lat. *Aquæ Perennes*), the chief town of the department of Marne, France, on the left bank of the Marne, here crossed by a bridge of seven arches, 20½ miles W.N.W. of Châlons, and on the railway from Paris to Strasburg. It is the centre of the Champagne wine trade, and has vaults cut in the soft tufa capable of containing 5,000,000 bottles. There are also potteries, wool-spinning mills, tanneries, brandy distilleries, and a trade in wine flasks, stoppers, &c. Pop. of commune 18,361; and of arrond. 99,067.

Ephah, a Hebrew measure of capacity, = 27·83 pints, or 3 English pecks and 3 pints.

Ephe'lis (Gr. 'a sun-freckle'), is the scientific name for sun-burn. E. can be removed when recent by an emulsion of bitter almonds with spirits of wine, or the benzoated oxide of zinc, beaten into a cream with orange or elder-flower water, and when chronic by a lotion of bichloride of mercury, or nitro-muriatic acid.

Ephem'era (Gr. 'for a day'), a genus of Neuropterous insects, including those forms popularly known as 'day-flies' and 'May-flies.' Many are really born in the morning, only to be scorched by the heat of the noonday sun, the evening finding them dead in countless numbers. The family *Ephemeridæ* is distinguished by the five-jointed tarsi and by the large front wings. The abdomen has three appendages, and the head of the larva possesses a 'horn.' These insects undergo an incomplete metamorphosis, the larvæ inhabiting water. One species, the 'May-fly,' is familiar in our ponds and streams. The metamorphosis may take more than a year. The body is slender and the wings long. The pupa casts off its skin, leaving it attached to water-weeds, and flies into the air as the perfect form or *imago*. Vast numbers of these insects appear suddenly in some localities. They are much used as bait by anglers.

Ephem'era, or **Feb'ris Dia'ria,** is a mild febrile attack having a slight local cause, and lasting no longer than a single day.

Ephem'eris (Gr. 'a diary'), an astronomical table giving beforehand the positions of a heavenly body. Ephemerides of the sun, moon, planets, and stars are calculated and published annually; those of periodic comets are usually given when they are approaching their perihelia. The *Nautical Almanac*, the French *Connaissance des Temps*, and the German *Jahrbuch* are publications of this nature, and are invaluable to the mariner and traveller as a means of fixing longitude.

Ephe'sians, Epistle to the, according to the unanimous tradition of the Church, was written by the Apostle Paul to the Church he had founded at Ephesus. External evidence is very strong that it was addressed, as stated in chap. i. 1, 'to the saints at Ephesus;' a number of particulars in the epistle, on the other hand, have forced some critics to the conclusion that it was not written by Paul. The difficulty of Paul having written it to the Ephesians may have given rise to the omission from some MSS. of 'which are at Ephesus,' and to the substitution in some of 'to the Laodiceans.' Those who hold the Pauline authorship suppose it to have been written from Rome during the apostle's captivity (Acts xxviii.), about the same time as those to the Colossians, Philippians, and Philemon were written (or about A.D. 62). According to some, it was written from Cæsarea (Acts xxiv.-xxvi.). See Davidson's *Introduction to the New Testament*.

Eph'esus, the chief of the twelve Ionian cities on the coast of Asia Minor, said to have been founded by Androclus, son of Codrus, at the Ionian migration, stood at the mouth of the river Cayster, in a marshy plain, bounded on E. and S. by the two hills Prion or Lepre and Coressus. The buildings of the city were partly on these two hills and partly on the plain about the harbour—a lake communicating with the Cayster, the mouth of which formed the outer harbour (Panormus). To the N.E. of the city was the celebrated Temple of Diana. This magnificent building, reared in the 6th c. B.C. by the contributions of all the Greek cities of Asia Minor, in place of the original temple, was destroyed by fire on the night Alexander the Great was born, 13th October, B.C. 356. It was restored by the joint efforts of all the Ionian states, was regarded as one of the wonders of the world, had the privileges of a sanctuary, and was again destroyed by the Goths. Nothing now remains but some traces of its foundations. The ruins of several other large buildings are to be seen, besides the foundations of the walls of the city. E. fell successively under the sway of Crœsus, the Persians, Macedonians, and Romans, the last of whom made it the capital of the province of Asia; and from its easy access to the interior and its excellent harbours, it became the chief emporium for trade and the greatest city in Asia Minor. E. was emphatically a sacred city, both from its heathen temple, the rebuilding of which was an epoch in architecture, as then the Ionic order was perfected, and also from its connection with Christianity. Several episodes in St. Paul's life are associated with it (Acts of Apostles). According to Eusebius, St. John also spent the last years of his life here.

Eph'od (Heb. from *aphad*, 'to gird on'), was a vestment worn by the priests among the Israelites when they consulted the Deity or practised divination. It consisted of two parts—one covering the breast and the other the back—fastened to each other on the shoulders by two jewels, on which were engraven the names of the twelve tribes—six on each; and further confined by a girdle passing round the middle. According to Rationalistic critics, the right of wearing the E. and using the Urim and Thummim (q.v.), *i.e.*, of giving oracles, belonged, in the earlier stage of the Israelitish religion, to the priests in general (1 Sam. ii. 18, 28, &c.). Hence Israelites who instituted for their families a religious service of their own, with a priest attached, were said 'to make an E.' (Judges viii. 27; xvii. 5). It was the later priestly legislation (they affirm), reduced to its present form after the Captivity, which assigned the E. and the oracular power to the high priest alone, and by introducing such passages as Exod. xxv. 7; xxviii. 4, *seq.*; xxix. 5; xxxv. 9, 27; xxxix. 2, *seq.*; Lev. viii. 7, produced a manifest anachronism, since they are irreconcilable with such passages as 1 Sam. ii. 18, 28; xxii. 18; 2 Sam. vi. 14; 1 Chron. xv. 27; Deut. xxxiii. 8. But the orthodox school of critics meet the difficulty by supposing that there were *two* kinds of E. in use at the same time, one for the ordinary priest and one for the high priest.

Eph'ori (Gr. *ephoraō*, 'I oversee'), a directory of five men in the Spartan government, at first intended to be a check on the kings, but who gradually won the entire control of the state. The E. were said to have been instituted by Lycurgus, but were more probably appointed at a later period. They were chosen from the people, and held office for a year.

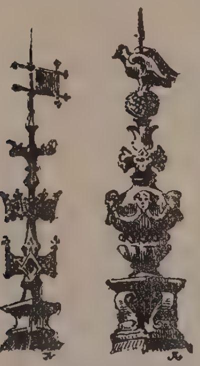
Eph'raem Sy'rus ('Ephraim the Syrian'), an ecclesiastical writer, was born probably at Nisibis, and was educated by the bishop of that place, whom he accompanied to the Council of Nice (325). After Nisibis was ceded to the Persians (363) he settled at Edessa, where he became a deacon in (some say abbot of) a monastery, and remained till his death in 378. He was a most ardent devotee of monachism, and a prolific writer against idolaters, Jews, and heretics of all kinds—Arians, Sabellians, Novatians, Manichæans, Gnostics, Marcionites, &c.; he wrote also commentaries on most of the books of the Old Testament (except the Psalms and Book of Proverbs), sermons, hymns, &c. All his writings—which were so popular that they were read in church along with the Holy Scriptures, and got their author the name of the 'Prophet of the Syrians,' 'Column of the Church,' 'Harp of the Holy City,' &c.—were in Syriac. Those said to have been originally written by him in Greek are partly versions of the original Syriac and partly spurious. They were translated into Greek, Latin, Slavonic, and Armenian. The best edition appeared at Rome (vols. i.-iii. Gr. and Lat., vols. iv.-vi. Syr. and Lat., 1732-46), edited by the Maronite Petrus Benedict and Stephan Evodius Assemani. As an interpreter of Scripture E. adopted a highly allegorical style, often artificial and extravagant. This spiritualising exposition was probably adopted in opposition to the Marcionites, who endeavoured to bring the Old Testament into antagonism with the New by adherence to a grossly literal, unfigurative interpretation.

The name of E. S. is associated with one of the most ancient and valuable extant MSS. of the Bible—Codex C., No. 9, in the Imperial Library at Paris—which contains portions of the LXX. and fragments of every part of the New Testament. The original writing was almost entirely removed about the 12th c. to make room for some of the writings of E. S. in Greek, but has been to a certain extent restored by means of chemicals. Brought from the East to Florence in the 16th c., it came to Paris with Catharine de'

Médici, and was published by Tischendorf in 1843-45. See Assemani in *Biblioth. Orient. Vatic.*, and Mosheim's *Church Hist.*

Eph'raim was the younger of the two sons of Joseph, and was counted, like his brother Manasseh, along with his uncles, the sons of Jacob, as one of the twelve patriarchs. The tribe numbered 40,500 at the first census (Num. i.), at the second (Num. xxvi.), 32,500. Its territory lay in the centre of the land of Canaan, and after the separation under Jeroboam, E. was the leading tribe in the kingdom of Israel; indeed it might be said that the history of the latter is neither more nor less than the history of E.

Ép'i, in architecture, is an ornament of glazed earth or lead which is sometimes placed on the summit of pointed roofs. During the 13th and 14th centuries earthenware épis were used, but afterwards those made of enamelled faïence. In the 15th c. to the É. was added a capital richly decorated with foliage and surmounted by a vase of graceful form. Above this was placed a fir cone, a basket of flowers, or a bird poised on a globe. Lead had become the popular metal, and continued so till recent times, when on the ground of economy zinc superseded it. See *Art Dictionary.*



Epi of the 15th c.

Epichar'mus, a Dorian of Cos, according to Plato 'the prince of comedians,' was born about 540 B.C. E. is said to have studied philosophy under Pythagoras. He resided for a time at Megara in Sicily, and subsequently at the court of Hiero. He gave a new form to the early comedy by freeing it from some, at least, of its buffoonery, and by introducing a regular plot. The titles of thirty-five of his comedies are known. They are generally on mythological subjects. The *Menæchmi* of Plautus is said to have been founded on a comedy of E. Krurmann has edited the extant fragments of E.'s writings (Haarl. 1834).

Epicoroll'æ, or **Epipetal'æ,** a division of Exogenous plants forming one of the subdivisions of *Corolliforæ*, and characterized by the stamens being inserted on the corolla. To this group the natural orders *Gentianaceæ*, *Convolvulaceæ*, *Solanaceæ*, *Labiatæ*, *Primulaceæ*, &c., belong.

Epic Poetry (Gr. *epos*, 'a discourse'). An epic is a long narrative poem dealing generally with heroic or superhuman persons and events, with romantic or supernatural exploits and adventures. It is distinguished from the narrative poem by greater dignity of style, cohesion of plot, and symmetry of structure; from the drama, in which the author never speaks in his own person; from the lyric, by its great length, and by making the narration of action rather than the expression of emotion its predominant feature.

The three great classical epics are Homer's *Iliad* and *Odyssey*, the former relating the siege of Troy, the latter recounting the wanderings of Odysseus, and Virgil's *Æneid*, on the voyages of the Trojan Æneas and his conquest of Italy, an elaborate glorification of the Augustan age of Rome. The *Niebelungen Lied* is the great Teutonic epic, in which we dimly trace historic persons and events of the 5th c. Its author is unknown; it seems to have been composed between the 7th and 11th centuries. A still older product of the Teutonic muse is the *Tale of Beowulf* (q.v.), which may be regarded as the epic of the Old English peoples. The *Shah Nameh* of the Persian poet Firdusi (937-1020); the *Lusiad* of the Portuguese Camoens (1524-79), on the voyage of Vasco da Gama to India; the *Gerusalemme Liberata* of Tasso (1544-95), on the siege of Jerusalem in the First Crusade, are also famous specimens of the epic; but the *Divina Commedia* of Dante (1265-1321) and the *Paradise Lost* of Milton (1608-1674) are the only two which challenge comparison with the Grecian masterpieces. Besides the great regular epics, there are collections of epic legends, such as Hesiod's *Theogony*, the Norse *Edda* and *Heldenbuch*, the Indian *Mahabhârata*, and the Spanish *Romancero*. The historical epic adheres closer to fact than the heroic; of this class the *Punica* of Silius Italicus is an unfavourable, and the *Brus* of Barbour an admirable, example. The *Orlando Furioso* of Ariosto (1474-1533) holds an intermediate place between the stately serious epic and the mock-heroic or humourous epic, which is represented by the *Battle of the Frogs and Mice*, ascribed to Homer, Pulci's *Morgante Maggiore*, the old German poem *Reynard the Fox*, Butler's *Hudibras*, Boileau's *Lutrin*, Pope's *Rape of the Lock*.

Among the innumerable unsuccessful epics of ancient and modern times may be mentioned the *Argonautica* of Apollonius Rhodius, Lucan's *Pharsalia*, the *Thebaid* of Statius, Lope de Vega's *Circe*, Ercilla's *Araucana*, Ronsard's *Franciad*, Davenant's *Gondibert*, Voltaire's *Henriade*, Klopstock's *Messiah*, Wieland's *Oberon*, and Southey's *Madoc*. Landor's *Gebir*, though wanting in epical length, is epical in structure and style.

Epicte'tus, a philosopher of the Stoic school, was born at Hierapolis, in Phrygia, and flourished towards the close of the 1st c. E. taught first at Rome, but when Domitian banished the philosophers, he retired to Nicopolis in Epirus. The teaching of E. is preserved in the four that remain of the eight books of Commentaries by his pupil Arrian, the historian, and in the *Encheiridion* ('handbook'), compiled from his discourses, by the same writer. E. taught 'that the beginning of philosophy is the perception of one's own inability to do what is needful; that only what is within our choice is good or evil; that nothing external can control our choice; that our choice is determined by our reason; that our resemblance to God consists in our acting according to reason; and that we ought to invoke God's assistance.' It is not wonderful that E. has been considered a Christian, and, though this cannot be established, there can be no doubt that in important respects 'he approaches the Christian doctrine more closely than any of the earlier Stoics.' An excellent edition of E. is that of Schweighaüser (Leipz. 1800).

Epicu'rus, a famous philosopher of antiquity, was born at Samos or Gargettus, near Athens, about 342 B.C. His father was a teacher of grammar. When only eighteen, E. visited Athens; subsequently he went to Athens, Colophon, Lampsacus, and Mitylene. In 302 he opened a school at Athens, where he remained till his death in 272. The famous 'Garden' soon became a dangerous rival of the Porch, the Grove, the Lyceum, and the Cynosarges. Though severely libelled by the Stoics and their admirers, E. seems to have been a virtuous and amiable man. He gave his guests at the Garden barley cakes and fresh water. Philosophy he regarded, not as the instrument of absolute truth, but as the art of reaching happiness. Like Aristippus, he said happiness consisted in pleasure; but the most permanent, the least hurtful, are the pleasures of the mind: virtuous habit and the supremacy of reason are necessary to happiness. As regards the body, the chief thing is to be contented with a little of the simplest; the felt want of luxuries is a great torment. Ignorance, the great obstacle to happiness, is either of the external world or of human nature. To these two kinds of ignorance the *Physica* and the *Canonica*, or Logic, are respectively applied. The former—described in Diogenes Laertius and discussed by Seneca and Cicero (*De Fin.*)—was based on the atoms of Democritus, whose emanations produced sensations. The atoms were subject to physical laws and not to the caprice of the gods. E. added to the theory of Democritus the hypothesis that each atom in its downward course slightly deflected from a right line, and thus became capable of collision and combination. In sensation itself E. admitted there was neither truth nor falsehood; but *prolepsis*, or conception formed by repeated sensation, made possible knowledge, or the classification of the sources of pain and pleasure. Of E.'s 300 works, only three letters are preserved, and some passages of a work on nature, found at Herculaneum. His school was continued by Hermachus, Polystratus, Dionysius, Basilides, till the age of Augustus. Among Romans, Lucretius, Horace, and Lucian are his chief followers. In modern Europe the system was revived by Gassendi (1590-1655), who wrote a life of E. and a treatise on the philosophy, and adopted by Rochefoucault, Fontenelle, Voltaire, and others. All his disciples, however, do not adopt his views with regard to the fear of death and the fear of the gods, both of which he said were groundless, the soul being simply a compound of air, vapour, and heat, and the gods not being actively interested in human fate. E. also dwelt on the reciprocal advantages implied in justice and friendship. Community of goods, he said, implied mistrust. See Ritter and Preller, *Hist. Phil.*; Bain, *Mental and Moral Science*; and Zeller on *Stoics and Epicureans*.

Ep′icycle (Gr. *epi*, 'upon,' *kuklos*, 'a circle'). When the early astronomers, having fixed the earth in the centre of the universe, and given to all celestial bodies what they deemed the most perfect of motions, viz., circular motion, came to compare their system with the true facts of observation, they were necessarily astonished at the great discrepancies which existed. Ptolemy (q.v.) was especially perplexed at the retrogressions and other irregularities of the planets, and to meet this difficulty devised what he termed *epicycles*. The planets were supposed to move in circles, whose centres moved uniformly in a larger circle round the earth. Each planet he found required a different-sized E.; and though his system was extremely cumbrous, especially when viewed in the light of the Newtonian system, it was undoubtedly ingenious. See PTOLEMAIC SYSTEM.

Epicy′cloid is the curve described by a point in the circumference of a circle which is rolling on the outer circumference of a fixed circle. If the rolling take place *inside* the fixed circle, the curve described is called a *hypocycloid*. When the tracing point is not in the circumference, the corresponding curves are known as *epitrochoids* and *hypotrochoids*. If the rolling circle be equal to the fixed circle, the E. becomes the *cardioid*. A hypotrochoid of two circles whose radii are as 1 : 2 is an ellipse, whose eccentricity increases as the tracing point is moved nearer the circumference of the rolling circle, the hypocycloid ultimately produced being a straight line—a diameter of the fixed circle. The E. is of practical importance as being that form for the teeth of a toothed wheel which reduces friction to a minimum.

Epidam′nus. See DURAZZO.

Epidaur′us (originally called *Epicarus*, from its supposed colonisation at first by Carians), a town in Argolis, on the Eastern coast of the Peloponnesus. During the historical period it was in the possession of the Dorians. After passing through the phases of a monarchy, an oligarchy, and a tyranny, E. finally reverted to an oligarchy. It was at an early period an important commercial city, and its famous temple of Æsculapius drew invalids from all quarters. The sacred enclosure, in which the temple stood, is to this day called *Hieron* ('the sanctuary'). E. had also temples to Athena, Artemis, Dionysus, Aphrodite, and Hera; and a magnificent theatre 370 feet in diameter, capable of containing 12,000 spectators. E. colonised the islands of Cos, Calydnus, and Nisyrus. Ægina, another of its colonies, in time almost drained the commerce of the parent city. Its famous temple, however, was still rich in gifts when L. Æmilius Paulus visited it in 167 B.C., after the conquest of Macedonia; but by the ravages of Sulla it was swept of all its votive offerings in common with many other shrines. E. was celebrated for its vines and its breed of horses. The ancient name still survives in the modern *Pidavro*.

Epidem′ic Diseases (Gr. *epi*, 'upon,' and *dēmos*, 'the people') are chiefly distinguished by the circumstance that they attack a number of people in one place simultaneously. They travel from place to place, and break out with great violence, more especially in populous centres, and they may become extinct in a locality to reappear after many years. The best-known E. D. are cholera, smallpox, measles, scarlet fever, dengue, typhoid and typhus fevers, yellow fever, and diphtheria. Various theories have been propounded regarding the mode of propagation; but it is now generally admitted that all E. D. are communicable, and that each has its own mode of propagation. They are consequently preventable diseases. See separate articles on the various diseases.

Epidemic Mental Diseases. Popular excitements, so denominated, have nothing in common with epidemic diseases, except in so far as numbers of people are similarly affected at about the same time. Public enthusiasm is never allowed to lie long dormant, and one excitement follows another in rapid succession; but although the weaker class of mind is more liable to be affected, and may be completely upset, this does not constitute a disease. In epidemic diseases the specific poison results in the same specific disease, and in no other; whereas in so-called E. M. D. the result lacks this uniformity. Particular crimes, and modes of crime, frequently prevail; but disease is not necessary to explain the phenomena. There is, however, some influence, apart altogether from human communication, by which numbers of people may be affected simultaneously, and which may be called E. M. D. This is best seen in large communities of the insane, where similar delusions and propensities simultaneously affect numbers of the patients who have had no communication with each other. The best-known E. M. D. are St. Vitus's dance, wolf-madness, demonomania, incendiarism, suicide, and panic. See the *Psychological Journal*, and the works of Calmiel and Hecker.

Epider′mis (Gr. *epi*, 'upon,' *derma*, 'the skin'), or **Ec′teron** (the 'outer,' *i.e.*, skin), the name given to the outer and upper layer of the skin in higher animals The E. in man is composed of layers of flat or squamous *epithelial cells*, the deeper cells being elongated, and having their long axes arranged vertically to the skin-surface, whilst the more superficial cells are of flattened shape and lie lengthwise. The deepest layer of the E. is named the *rete mucosum*, and it is in this latter layer that pigment or colouring matter is deposited. The growth of the E. is effected from below, new layers of cells being produced to take the place of those that are gradually lost or worn away by friction, ablution, &c. The deeper cells become more or less scaly and horny as they approach the surface, and lose the more typical character of the deeper cells. The thickness of the E. varies greatly in different regions of the body. Thus on the soles of the feet and palms of the hands the E. is very thick and horny. In such situations, the thickness of the E. prevents evaporation from the true skin or *dermis* beneath. The E. is frequently named the *cuticle*. It is not sensitive, possessing no blood-vessels or nerves. In lower vertebrates, such as serpents, &c., the E. is periodically exuviated or cast off. In *plants*, the name E. is given to the delicate cellular tissue or *parenchyma* which forms the outer covering of leaves and of other parts of plants. The E. of plants is made up of flattened cells, often provided with hairs. The lower E. of leaves is perforated by numerous openings or *stomata*, the respiratory or breathing apertures of the leaves. Occasionally the E. of plants becomes hardened by the deposit of woody matter in the walls of the cells of which this membrane is composed.

Ep′idote, a mineral forming monoclinic crystals, with a varying green, brown, or grey colour, hardness between felspar and quartz, and specific gravity about 3·5. E. proper consists of a combination of silica, alumina, iron oxide, and lime; but by substitution of magnesia, lime, &c., for proportions of the iron, several varieties are formed. It has no economic application. The name was derived by Haüy from the Gr. *epididōmi*, 'I increase,' in allusion to the fact that the base of the primary is often much enlarged in the crystals.

Epigen′esis (Gr. *epi*, 'upon,' and *genesis*, 'a beginning' or 'new formation'), a name given in physiology to a theory which held that all new substances in living beings, and even living organisms themselves, were formed of or upon previously existent parts or substances, new organisms being formed by a modification of the old.

Epiglott′is (Gr. *epi*, 'upon,' and *glōttis*, 'the mouth of the windpipe'), a cartilage of an ovate shape, covered by mucous membrane, placed in front of the superior opening of the larynx, and immediately behind the base of the tongue. See LARYNX.

Epig'oni (Gr. *Epigonoi*, 'the afterborn'), the term used in mythic story to denote the sons of the seven heroes—Adrastus, Polynices, Tydeus, Capaneus, Parthenopæus, Amphiaraus, and Hippomedon—who, with the exception of the first named, perished in the war against Thebes. To avenge the death of their fathers, the E., ten years thereafter, under the leadership of Alcmæon, who had collected a band of Argives, marched against Thebes. The Thebans, under Laodamas, were routed near Glissas in Bœotia, while Ægialeus, on the side of the E., was slain. Thebes was at last taken by the E., and levelled with the ground. The common list of the E. contains Ægialeus, Alcmæon, Diomedes, Euryalus, Promachus, Sthenelus, and Thersander. The war of the E. was the subject of many epic and tragic poems, not one of which has survived.

Epi'gram (Gr. *epi*, 'upon,' and *gramma*, 'a writing'), literally an inscription. The Greek E. was a short poem, mostly in elegiac verse, containing a statement of a single event or thought. Simplicity, rarely point, is its characteristic. The Greek anthology contains about 4500 epigrams by about 300 authors. Among the Romans the E. often took a satirical character. Of the many Latin epigrammatists, whose names have been preserved, Catullus and Martial are incomparably the best. The latter wrote about 1500 epigrams, and might be styled an epigrammatist by profession. The modern E. generally ranges from two to eight lines in length, and contains a witty or ingenious turn of thought pointedly expressed. Pope, Swift, Burns, Byron, Moore, and many other English writers, have evinced great epigrammatic talent, but among the moderns the French in E. stand pre-eminent.

Ep'igraph (Gr. *epi*, 'upon,' and '*graphō*, 'I write') is the name given to an inscription on a public building or other architectural structure, telling its object, use, or period of construction. In literature it is applied to a quotation or sentence placed as a motto at the beginning of a book, part, or chapter.

Epilep'sy (Gr. *epi*, 'upon,' *lambanō*, 'I seize,' future *lēpsomai*), popularly termed 'falling sickness,' is a complex nervous disease characterised by a sudden and complete loss of consciousness, associated with convulsions, which impede the respiratory process. The epileptic state may vary from simple vertigo, momentary loss of consciousness, and a totter of step, to the most severe convulsive paroxysms. E. was known by the ancients, and was made the foundation of the doctrine of demoniacal possession in the Jewish, Grecian, and Roman philosophy. The attack is sometimes preceded by a premonitory symptom called *aura epileptica*, in which the patient has the sensation of a fluid creeping from the fingers or toes upwards towards the trunk, or as though a spider or insect were crawling over the skin. Some have slight vertigo or headache, swelling of the veins, or throbbing of the arteries of the head, and others have illusions of one or other of the special senses. In general there is immediate loss of consciousness; the patient utters a loud cry, falls down in convulsions, which may be trifling and transient, or terrific and long-continued struggles. Each patient generally falls in a definite position, and injures by the fall one part of the body, as the nose, or side of the head; and some invariably protrude the tongue, which may be bitten through, or much injured by the spasmodic clenching of the teeth. Death may take place during the fit; but the great danger is from the position occupied when the fit comes on; thus the patient may fall from a height, or into the fire, or water, or on some sharp-cutting instrument, or the fit may come on during the act of swallowing and cause suffocation. Attacks of E. vary in frequency of occurrence, and there is often a very definite periodicity. In severe cases the attacks may be daily, or several times daily; but, in other instances, considerable intervals may elapse. In asylum practice the experienced physician can frequently prognosticate, from slight appearances, that an attack is impending. E. is common among congenital idiots, and is of frequent occurrence among the insane, as a cause or a coincident, and the two diseases are intimately associated. E. is an hereditary disease. It may pass from parent to child, or it may skip over a generation or two. The originating causes of E. are but imperfectly known, although physiologists have of late years made great advances in the study of its etiology. *Post-mortem* examinations throw but little light on the disease. The seat of E. is most probably in the brain, the medulla oblongata, or upper portion of the spinal cord. In most epileptics there is probably an hereditary or a latent tendency, and in some the disease may originate *de novo* from causes which are usually called exciting. In the former class of cases, apparently slight causes, such as functional derangements, interruptions in the circulation which may cause congestion of the brain, may give rise to an attack. The proper treatment during the fit is to place the patient flat on his back, with the head and shoulders a little elevated. The neck-tie and tight-fitting clothes should be loosened, and he should be exposed to a free current of air. Beyond preventing self-injury, no effort should be made to restrain the convulsive movements, nor to rouse by cold water and stimuli. Epileptics should make their health a constant study, as the slightest derangement or excess of any kind may bring on a seizure. They should never expose themselves in any dangerous position. Hygienic treatment is of more avail than any of the specifics that have been recommended, such as nitrate of silver, iodide and bromide of potassium, valerian, zinc, &c. The disease is not curable by any known specifics, nor is it often cured spontaneously. When associated with organic disease of the brain it is incurable; but in very many cases the frequency of the attacks and their severity may be lessened, or they may altogether disappear, by very careful attention to the laws of health, and the avoidance of excesses of every kind. E. must never be confounded with Fainting, Apoplexy, Hysteria, Catalepsy, Eclampsia, or Infantile Convulsions, &c.

Epilo'bium, or **'Willow Herb,'** a genus of Exogenous plants belonging to the order *Onagraceæ*. These plants have four sepals and four petals, a four-sided seed-capsule, and seeds provided with hairs at one extremity. The long pod-like ovary is adherent to the tube of the calyx, the petals and stamens being epigynous. Species of E. are found both in temperate and cold climates. The British species occur in damp situations. One species, known as 'French willow,' has dissimilar petals and rose-coloured flowers. It is common in shrubberies. The pith of E. is used in Kamchatka for making a kind of ale and vinegar.

Ep'ilogue (Gr. *epi*, 'after,' and *logos*, 'a speech'), in oratory, means the peroration or summing up of a discourse. In theatrical language, it is a short speech in prose or verse at the end of a play. The E. was much in vogue in former times, especially in the case of comedies; and was apologetic, conciliatory, or even rollicking in tone, its object being to acknowledge the indulgence, win the sympathies, and excite the good humour of the audience.

Epimen'ides, a poet and prophet born at Phæstus in Crete. While yet a boy, being sent for a sheep by his father, he entered a cave, and fell into a sleep which lasted fifty-seven years. On awaking he was astonished to find all around him changed. The Greeks looked on him as a favourite of the gods; and the Athenians, whom he delivered in 596 B.C. from the plague that followed Cylon's sacrilege, greatly honoured him. He is said to have attained a very old age, one legend assigning him a lifetime of 299 years. When or where he died is uncertain. By some E. was reckoned—instead of Periander—one of the seven sages of Greece, but he seems rather to have belonged to the class of Orphic bards. Besides other works, two epics—one on Jason and the Argonauts, the other on Minos and Rhadamanthus—are said to have been written by him. E. is supposed to be the prophet alluded to by St. Paul in his Epistle to Titus (i. 12).

E'pinal (Eng. 'Thornton;' Fr. *épine*, Lat. *spina*, 'a thorn'), the capital of the department of Vosges, France, on the left bank of the Moselle, beautifully situated at the foot of the Vosges, 35 miles S.S.E. of Nancy by railway. It lies in a valley, 1120 feet above the sea, and has fine promenades, quays, fountains, public baths, the ruins of an old castle, a church (St. Maurice) of the 10th c., a small university, a public library of 22,500 volumes, a hospital, an art gallery, schools for music and drawing, and a theatre. The Moselle is here crossed by an iron suspension-bridge and by several stone bridges. There are manufactures of edge-tools, chemicals, machinery, paper, lace, &c., and a trade in wine, ironwares, linen, and cattle. About 6 miles S.E., on the Moselle, are the famous paper-mills of Archettes. Pop. of commune 23,223; and of arrond. 109,738.

Épinay, Louise Florence Pétrouille de la Live d', a French authoress, born about 1725. She was the daughter of an officer, Tardieu d'Esclavelles, and in 1735 married her cousin D'Épinay. The union was unhappy, D'Épinay neglecting his wife, of whom Grimm professed himself the lover. Afterwards Madame d'É. formed a warm attachment for J. J. Rousseau, for whom she caused the famous hermitage to be built in the valley of Montmorency, near her country-seat of La Chevrette. Rousseau, however, becoming jealous of Grimm, quarrelled with Madame d'É., and in his *Confessions* assailed her and the *Encyclopédistes*, with whom she was familiar. During her last years Madame d'É. lived in retirement, consorting chiefly with men of letters, and composing memoirs, &c. She died 17th April, 1783. Her chief work, *Mémoires et Correspondance de Mme. d'É.* (Par. 1818), is a full, accurate, and vivid picture of 18th c. manners. See Sainte-Beuve's *Causeries du Lundi*.

Epipha'nius was born in Palestine about A.D. 320, of Jewish parents. Converted to Christianity at an early age, he went to Egypt, and joined the monks there. He afterwards returned to Palestine, and founded a monastery near his native place (Eleutheropolis). In 367 he was made Archbishop of Constantia (Salamis) in Cyprus, and died in 403. E. was learned in one sense, being acquainted with Hebrew, Syriac, Greek, Latin, and Egyptian, but at the same time extremely ignorant and credulous, not to say dishonest; but was nevertheless pious after his fashion, though extremely bigoted and dogmatic. His chief work is entitled *Panarion*, a discourse against (eighty) heresies. See his Life by Gervasius, 1738; his works were edited by Petavius (Par. 1622), and by W. Dindorf (Leipz. 1859-63).

Epiph'any (Gr. *epiphaneia*, 'the appearance of a deity to aid a worshipper') means in ecclesiastical usage the manifestation of Christ to the Gentiles. It is observed on the 6th January, twelve days after Christmas (hence called Twelfth Night), and now commemorates specially the guiding of the three magi to Bethlehem by the star (hence called also the Festival of the Three Kings), but originally also his nativity or incarnation, and the manifestation of his divinity at his baptism (Theophany), in his first miracle at Cana (Bethphany), and in that of feeding the 5000 men (Phagiphany). Formerly many lights were used at the festival, ostensibly in reference to Christ as the light of the world (John i. 9; Luke i. 78, 79), but in reality adapted by the Church from pagan ceremonies like those of Christmas and St. John's Day. See Bingham's *Eccl. Ants.*, and Walcott's *Sacred Archæology*.

Epiphe'gus, a genus of *Orobanchaceæ*, the 'broom-rape' order of Exogenous plants, of which *E. Virginiana*, 'the beech-drops' of N. America, is a familiar species. The root of this species is used as an application to cancerous affections, and has hence received the name of 'cancer-root.'

Epiph'ora is a disease of the secreting lachrymal organs, commonly called 'watery-eye.' E. must be distinguished from watery eye caused by obstruction in the lachrymal duct, and may be cured by vapour of laudanum or belladonna, or a solution of nitrate of silver, from two to four grains to the ounce.

Epiphy'tes (Gr. *epi*, 'upon,' and *phuton*, 'a plant'), plants which grow in the air attached to the stems and parts of other plants. Tropical orchids are examples, the roots not reaching the soil. They are of green colour, and possess *stomata*. The roots often possess hairs. Species of *Pothos* and *Tillandsia* are typical E. Many common plants, such as mosses and lichens, might, strictly speaking, be named E., but the name is rather given to higher or Phanerogamous plants which appear to select abnormal habitats, and to become somewhat parasitic in their habits. E. generally tend to injure the plants upon which they grow.

Epi'rus (Gr. *ēpeiros*, 'the mainland'), so called in contradistinction to the islands on the coast, was the name given to the north-western division of ancient Greece. It was bounded on the N. by Illyricum, on the E. by Macedonia and Thessaly, on the S. by the Ambracian Gulf, and on the W. by the Ionian Sea. In ancient times it was sparsely peopled, but contained a great number of tribes, chief of which were the Chaones, Thesproti, Molossi, and Athamanes. The inhabitants were a mixture of Pelasgians, Macedonians, and Illyrians. The country was mountainous, and produced excellent cattle and horses, and the renowned breed of Molossian dogs. The chief rivers were the Achelous, Arachthus, Celydnus, Thyamis, Acheron, Cocytus, and Charadrus. Its most ancient town was Dodona, famous for its oracle of Zeus; others of note were Ambracia, the capital of Pyrrhus, and Nicopolis, founded by Augustus to commemorate the victory of Actium. One of the earliest kings of E. was Pyrrhus or Neoptolemus, son of Achilles, the reputed founder of the Molossian line. In historical times its most famous ruler was Pyrrhus (B.C. 295-272), who harassed Rome for a long period. On the death of Ptolemy, grandson of Pyrrhus, E. became a republic, and remained so till the conquest of Macedonia by the Romans, B.C. 168. The Epirotes being accused of assisting Perseus, King of Macedonia, L. Æmilius Paulus, by order of the Roman Senate, razed seventy of their towns to the ground, and sold 150,000 of the inhabitants as slaves. From this blow E. never recovered. It followed the fortunes of the Roman and Byzantine empires till 1204, when a new dynasty, known as the *Despots* of Albania, was founded by a member of the Byzantine family of Comnenus. E. remained under this rule till 1466, when it was annexed to the Ottoman Empire. In 1881 a strip of territory east of the river Arta was ceded to Greece, and is now known as the nomarchy of Arta. The remainder of E. is part of the Turkish vilayet of Janina.

Epis'copacy (from the Gr. *episkopos*, 'a bishop') is that form of Church government in which there are several orders of clergy, those of one of the orders (the bishops) superintending the others—the presbyters, deacons, &c. Episcopalians hold E. to be essentially 'the dignity of a bishop,' which is the fulness of the priesthood and is comprehended in the apostolic office, and to be an apostolic and therefore divine institution, existing from the very first organization of the Church. From the same point of view E. has an indelible character, and possesses a threefold power—of *order* in the ministration of the sacraments, of *interior jurisdiction* in the conscience, and of *exterior jurisdiction* in the Church. Presbyterians, on the other hand, maintaining that E. came into existence as a later hierarchical development, hold the complete parity in respect of office and authority of all the clergy. The Roman Catholic, Greek, Lutheran, and Anglican (including the American and Scotch) are all Episcopal Churches. See BISHOP, and Blunt's *Dict. of Doctr. and Hist. Theology*.

Episco'pius, in Dutch **Bisschop, Simon**, a celebrated Arminian divine of the 17th c., was born at Amsterdam, 1st January, 1583, studied at Leyden, where he heard both Gomar and Arminius lecture, and at Franeker, where he heard Drusius. Joining the anti-Calvinist party (which was then in a minority), he obtained a church near Rotterdam, and in 1611 was chosen one of the committee of six Arminians sent to meet the Counter-remonstrants before the States-General. In 1612 he was appointed successor to Gomar at Leyden, though the Remonstrant feeling against him was so strong that his brother's house at Amsterdam was sacked. E. not only repudiated 'election,' and taught the universal offer of salvation, but generally depreciated the value of pure dogma, bringing into prominence the ethical and emotional aspects of religion. Even to the doctrine of the Trinity he endeavoured to assign a practical importance. Toleration, which is involved in the idea of human brotherhood, seemed to him a leading duty, and in this he was supported by Grotius and Barneveld, and the Republican party in civil matters generally. When Maurice of Orange, wishing to strengthen Calvinism for political purposes, called the Synod of Dordrecht (1618), E. made a noble but unavailing stand for free speech. He then withdrew to Antwerp and Rouen, but on Maurice's death resumed preaching at Rotterdam, and finally, in 1634, became Rector of the Arminian College at Amsterdam, where he died 4th April, 1643. E. is the great expositor of Arminianism. Among English divines Hammond and Tillotson owe much to him. His most important works are the *Confessio Remonstrantium* (1621), *Apologia pro Confessione* (1629), and the unfinished *Institutiones Theologicæ*. A complete edition of his works was published at Amsterdam in 1650-65.

Epi'sode (Gr. *epi*, 'besides,' and *eisodos*, 'a place of entrance, an entry'), an incidental narrative introduced by writers to give variety to their subject. In epic and didactic poetry the E., if fitly chosen and skilfully introduced, affords a pleasant relief to the reader. The stories of Hector and Andromache in the Iliad, of Aristæus and his bees in the Georgics, of Dido in the Æneid, of Ariadne in the *Peleus and Thetis* of Catullus, of Francesco da Rimini in Dante's *Inferno*, of Pastorella in Spenser's *Faery Queene*, of Damon and Musidora in Thomson's *Seasons*, of Margaret in Wordsworth's *Excursion*, and of Glaucus in Keats' *Endymion*, are familiar examples of the E. in ancient and modern poetry.

Epispas'tics. See COUNTER-IRRITANTS.

Epistax'is, or bleeding from the nose, is very common in children and young people, and usually depends on congestion of the mucous membrane. Cold applications to the forehead and bridge of the nose, with a brisk purgative, generally arrest E. In severe cases it may be necessary to plug the nose with a pledget of lint, or a sponge soaked in some astringent, as muriate of iron. When E. is copious, caused by the rupture of a vessel from violence, it may be necessary to plug both the posterior and anterior nares, but this can only be done by a surgeon.

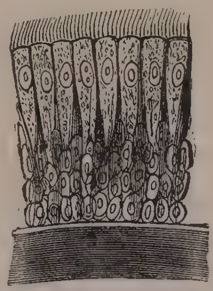
Epis'tle, in the New Testament, means a letter written by an apostle to an individual or a Church; in the Liturgy, the first lesson in the Communion Service, so called because generally taken from the apostolic epistles (hence the term 'apostle' also used), though sometimes also from the Acts, and even from the Old Testament prophets. See LESSONS.

Epistle Side of the Altar is the left or S. side, on which the Reader (q.v.) stands to read the Epistle (q.v.) in the Communion Service of the Church.

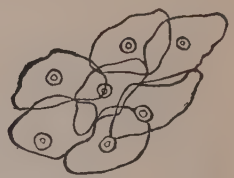
Ep'itaph (Lat. *epitaphium*, Gr. *epi*, 'upon,' and *taphos*, 'a tomb'), at first the name of a monument above a grave, now signifies an inscription on a tomb. The Greeks placed an inscription only on the tomb of a hero, but the Romans wrote epitaphs (generally beginning *Sta Viator*) on the tombs of their relatives. In England epitaphs in Latin are found written by the Romanised Britons, but the first Latin epitaphs written by Englishmen appear in the 11th c. From the end of the 12th to the middle of the 14th c. epitaphs are mostly in French, after which English is frequently used. Early Christian epitaphs are visible in the catacombs at Rome. Epitaphs form part of the literature of most countries, and large collections of them have been made, containing many fine examples of pathos, wit, and solemn brevity of expression. See Labbe's *Thesaurus Epitaphiorum* (Par. 1666), the *Anthologia Græca*, and Pettigrew's *Chronicles of the Tombs*, in Bohn's Antiquarian Library.

Epithala'mium (Gr. *epithalamion*), properly a song sung in chorus before the bridal chamber (*thalamos*), but now commonly applied to any nuptial song. Among the Greeks, Alcman, Stesichorus, Sappho, Anacreon, Pindar, and others wrote epithalamia, of which only scattered lines remain. The eighteenth idyl of Theocritus, in which twelve Spartan maidens sing the praises of Menelaus and Helen, is the most perfect specimen of the E. proper which we possess. The two nuptial songs of Catullus, and the E. of Peleus and Thetis by the same poet, are exquisite examples, and stand alone in Latin literature. In the *Medea* of Seneca we have the E. of Jason and Creusa, in Statius that of Stella and Violantella, in Claudian that of Honorius and Maria, but these cannot be compared with the hymeneals of Catullus. The E. was a favourite subject with the modern Latin poets. One by George Buchanan on Francis II. and Mary Stuart is remarkable for grandeur of thought and pomp of style. The E. of Spenser is one of the glories of English literature, and may safely be pronounced the paragon of all poems of its kind. Ben Jonson and Herrick, in their epithalamia, are largely indebted to Catullus.

Epithe'lium, a primary tissue of higher animals, composed of cells termed *epithelial* cells. This membrane is formed in the embryo from the *hypoblast*, or innermost of the three layers into which the *blastoderm* or *germinal membrane* divides. It is seen typically as the lining membrane to the digestive system, and as forming the lining of Glands (q.v.) and their ducts. The cells of which E. is composed form a continuous layer. They are *nucleated*, that is, possess central particles or *nuclei*. The outer skin is also formed of epithelial cells (see EPIDERMIS), so that this layer in reality forms both the outer and inner lining of the body. Four chief varieties of E. are found. The commonest, called *squamous*, *pavement*, or *tesselated* E., is seen in the skin, mouth, pharynx, gullet, conjunctiva of the eye, &c., and is formed of flat, oval, or polygonal nucleated cells, arranged in one or more layers. Such cells are also found in the serous sacs of the body, such as the pleura, &c., and in the blood-vessels. The *spheroidal* epithelial cells have a rounded outline, and E. formed of the latter is found as a lining membrane of glands. Hence it is also known as *glandular* E. The *cylindrical* E. is formed of cylindrical or *columnar* cells. This variety lines the stomach and intestine and the ducts of most glands. It also occurs in the gall-bladder, &c. Each cylindrical epithelial cell is packed closely amongst its neighbours, and has a flat nucleus with contained *nucleoli*. The last variety of epithelial cells is known as *ciliated* E., these cells being provided on their free extremities with delicate processes named *Cilia* (q.v.), which keep up a constant vibriatile motion, and thus aid in the diffusion and circulation of fluids, &c. These ciliated epithelial cells are found in the windpipe, larynx, Fallopian tubes, spinal cord, &c. The functions of E. are chiefly to protect the surfaces of the body, secrete fluids, and circulate fluid matters by aid of the cilia. E. contains both blood-vessels and lymphatic vessels. Its cells grow by absorption of nutritive matters from the blood, and new growths are continually taking place from beneath, to replace those cells that are worn away above.



Cylindrical Epithelium.



Cells of Pavement Epithelium.

Epizo'a (Gr. *epi*, 'upon,' and *zōon*, 'an animal'), a term applied generally to those animals which exist parasitically on the outer surfaces of others. This classification, like the use of the term Entozoa (q.v.), is founded upon no natural grounds, and is not used with any specific meaning in modern zoology. The chief E. are lice, fleas, bugs, bird-lice, &c., and certain *Acarina* or mites, such as the *Demodex folliculorum*, inhabiting the skin follicles of the human nose, may also be included under this name. The ticks and the itch-mite, causing the disease of that name in man, also belong to this group of parasites. The itch-mite, demodex, and their allies actually live within the skin substance; the lice, fleas, and commoner E. living upon the skin surface only. Bird-cages and hen-houses are much infested by the bird-mite, which lives upon the blood of the feathered inhabitants, and not unfrequently effects a lodgment beneath the epidermis of any persons who handle the cages or visit the houses. The result of this intrusion is a disease which goes by the name of *acariasis*. The bird-mite also attacks mice. Grass and fruit bushes often supply another pest called red mites, which swarm upon any intruder, and penetrating the epidermis produce sores to which the name of *rouget* is given.

Bird-Mite.

Red Mite.

Epizoöt'ics (from the same root as the foregoing) are diseases of animals, analogous to epidemics in the human species. They extend over vast tracts of country, and seem to be propagated from animal to animal, each disease having its own mode of propagation. Pleuro-pneumonia, foot and mouth disease, and vesicular epizoötic may be cited as examples.

E'poch, in chronology. See CHRONOLOGY.

Epoch, in astronomy, is the time at which a celestial body passes a certain point in its orbit which has been arbitrarily fixed. In a planet this point is usually the perihelion, and this determination of the time of perihelion passage constitutes one of the seven elements of a planet's orbit. For another signification of the same word, see HARMONIC MOTION.

Ep'ode (Gr. *epōdos*, 'singing to') was part of a lyric ode sung after the strophe and antistrophe. E. was also a name applied to poems in which each second verse was shorter than the first, or in which one of the verses was made up of two metres of distinct character, as in the *Epodes* of Horace.

Epp'ing, a market-town in the county of Essex, on the northern skirt of Epping Forest, 16 miles N.E. of London. It chiefly consists of a main street, running N. and S., on a slight elevation, and its principal industry is the production for the London market of butter, cream, cheese, &c. Cattle fairs are held here. Pop. parl. div. of county 55,416; reg. sub-dist. 5999; civ. and ecc. par. 2565.—The famous Epping Royal Forest, formerly known as Essex or Waltham Forest, has now dwindled to 60,000 acres, occupying the S.W. portion of the county, between the rivers Lea and Roding. Of its area, however, about 55,000 acres are estimated to be enclosed and private property (formerly hereditary in the family of the Earls of Mornington). Under statute 29 and 30 Vict. c. 62 all the duties and powers of management possessed by the Commissioners of Woods in relation to the forestal rights and interests of the Crown in E. F. were transferred to the Commissioners of H.M.'s Works and Buildings, and in 1871 Commissioners were appointed by Parliament to inquire into matters relating to the forest and report thereon. Since then the forest has been placed under the control of the Corporation of London. Had not Parliament interfered, the forests would most probably have been completely obliterated by this time. During the summer months the forest is a great resort of pleasure-seekers, especially from the eastern part of the metropolis. The bill of the Epping Forest New Railway was passed in August, 1894, under which a railway (either steam or electric) may be constructed from South Place, Finsbury, underground to Upper Clapton, and thence overground to High Beech, close to the most charming scenery in the Forest. The capital of the company is estimated to reach £2,100,000.

Éprouvette (Fr. from *éprouver*, 'to try'), an instrument for determining the projectile force of gunpowder. The ordinary E. takes the form of a pistol with a small strong barrel, and the propulsive force of the powder is estimated by the action that a given quantity of it on being fired exerts upon a spring or heavy weight. In British Government factories, large and fine grain gunpowder is tested with the 8-inch mortar elevated to an angle of 45°, in which are placed 2 oz. of powder and a cast iron shot weighing 68 lbs. Three firings take place, and the mean distance of the three ranges of the shot determines the strength of the powder. The test was found in practice to be fallacious, and the adoption of a more reliable system of proving powder has been under consideration.

Ep'som (anc. *Thermæ Ebbisham*, 'the warm springs of Ebba,' an early English queen and saint), an old market-town of Surrey, on the edge of Banstead Downs, 14 miles S.S.W. of London by railway. It has an elegant church, the tower of which contains a peal of eight bells, extensive nursery grounds, and some malting, brewing, brickmaking, &c., but is chiefly celebrated on account of the great racecourse in the vicinity, where races take place in April and May. (See DERBY-DAY.) E. Salts (q.v.) were originally made here at the sulphate of magnesia springs. Near E. is the Royal Medical Benevolent College (founded 1851), for the maintenance of decayed members, or their widows, of the profession, and for educating, training, clothing, boarding and lodging fifty of their boys. There are fifty pensioners who at first are elected to annuities ranging from £21 to £30 according to seniority, and in turn obtain residences at the asylum. The boys remain till 16-19. Sons of other medical men are also received at the school on payment of £60 per annum. The income is derived partly from charitable contributions (£10,133), partly from the payments for the scholars who are not on the foundation (£9011), and partly from invested funds (£639), bequests (£705), rents of lands, &c. (£70). London office, 37, Soho Square, W. Pop. par. div. of county 70,103; reg. sub-dist. 14,274; and civ. par. 8417.

Epsom Salts is the common name of sulphate of magnesia, and is so called on account of its occurring in the water of a spring at Epsom. It is found also in many other mineral springs and in sea-water, and is sometimes separated from the latter by fractional crystallization. It may also be prepared either from magnesite (native carbonate of magnesia), or from dolomite (carbonate of magnesia and lime). From the former of these two it is obtained by the direct action of sulphuric acid; from the latter by first calcining the mineral and then acting upon it with sulphuric acid. The solution of sulphate of magnesia resulting in either case is crystallized by evaporation. E. S. is a colourless crystalline substance, having a bitter and nauseous taste. When heated to 100° C., it loses six of its seven molecules of water. The remaining molecule can only be expelled at a much higher temperature. E. S. is used in medicine as a purgative in doses of from $\frac{1}{2}$ to $1\frac{1}{2}$ oz.

Ep'worth, a market-town and parish in Lincolnshire, 23 miles N.N.W. of Lincoln. The principal industries are flax and hemp dressing, and cattle, flax, and hemp are sold at the two annual fairs. John Wesley was born at E., 17th June, 1703. Pop. reg. sub-dist. 3657; and civ. par. 1903.

Eq'uable Mo'tion, known more commonly as uniform velocity. See VELOCITY.

E'qual Tem'perament, in music, the system of tuning by which the octave is divided into twelve equal semitones, as in the pianoforte, &c. See JUST INTONATION and TEMPERAMENT.

Equa'tion, in pure mathematics, is an assertion of equality between two expressions, and is represented to the eye by the symbol $=$. Thus $A = B$ is an assertion of equality, and is therefore an E. Now such an assertion may be always true, whatever the values of the quantities involved may be; as, for instance, $a = a$; $(a + b)^2 = a^2 + 2ab + b^2$; &c.

These are called equations of identity, or simply Identities (q.v.). But if we assert that $a + 3 = 5$, then we have an E. of condition, which is satisfied by only one value of a, namely 2. It is this latter class which is more particularly studied here. Into all such equations quantities of two distinct kinds enter—the *knowns* and the *unknowns*. In the E. above, 3 and 5 are of course known, while a is unknown, but may be at once given in terms of the others. This determination of the unknown is the solving of the E., and any definite value, expressed in terms of the known quantities, which when substituted for the unknown quantity satisfies the E. (*i.e.*, reduces it to an identity), is called a *root* of the E. Thus the E. $x^2 = 5x - 6$ has two roots, namely 2 and 3. The investigation of general expressions constitutes the *theory of equations*, an extremely important branch of algebra. An E. containing more than one unknown quantity, such as $a_1 x + b_1 y + c_1 z = p_1$, where x, y, and z are the unknowns, cannot be solved in a determinate manner. To render a solution possible, there must be as many equations as there are unknown quantities, so that in this case we must have for the complete determination of x, y, z, two other equations, $a_2 x + b_2 y + c_2 z = p_2$, $a_3 x + b_3 y + c_3 z = p_3$. From these any two of the unknowns may be eliminated, and the remaining one expressed in terms of the coefficients. When algebra was first brought into Europe by the Arabs, who obtained it from the Hindus, equations of the second degree had been solved. The Italians added, imperfectly, the solutions of the third and fourth, and these have in more recent times been completely solved. The general E. of the fifth was then tried, but unsuccessfully, and Abel has proved that it is impossible to obtain an expression depending on the coefficients which may have five values, and which satisfies the E. Here we cannot enter into the methods devised by Newton, Fourier, Sturm, Horner, &c., for approximating to numerical roots of equations, but must refer to the many treatises on the subject by Legrange, De Fourcy, Murphy, Young, Hymers, Peacock, Todhunter, &c.

Equation, Lunar.—The numerical expression for a perturbation of the moon. See LUNAR THEORY.

Equation of Equinoxes is the difference between the true position of the Equinoxes (q.v.) and the position calculated upon the supposition that their Precession (q.v.) is uniform.

Equation of Light, in astronomy, is the allowance which must be made for the time which the light emitted by a celestial body takes to traverse the space separating that body from the earth, and is one of the corrections which must be applied to the observed position in order to obtain the true position of a given star.

Equation of Payments, a rule in arithmetic for ascertaining the time at which a whole debt, due in different parts payable at different times, should be paid so as to be attended with loss to neither party. The rule is now of little practical use, sums of money due at a future time being generally secured by bills of exchange or promissory notes. If the time of payment is altered, it is usually with a view to immediate payment. See DISCOUNT.

Equation of the Centre is the difference between the true observed longitude of the earth and its mean longitude as calculated upon the supposition that the earth moves uniformly in a circle round the sun. This difference, owing to the small eccentricity of the orbit, never exceeds 1° 55′ 33″·3.

Equation of Time is the difference, measured in mean solar time, between the true time as given by a sun-dial and the mean time as indicated by a well-regulated clock. It arises mainly from the varying velocity of the earth in its orbit, and the eccentricity of that orbit, from which causes the true or observed right ascension of the sun must obviously differ from its mean right ascension, or the right ascension which it would have if the earth moved uniformly in a circular orbit round it during the course of a year. The obliquity of the ecliptic also influences this equation to an appreciable extent, and the moon and planets must likewise have a perturbing effect. See DIAL.

Equations, Chemical. These represent by means of symbols and formulæ chemical reactions. Thus $2H_2 + O_2 = 2H_2O$ represents the reaction which takes place when hydrogen and oxygen combine to form water. See CHEMISTRY.

Equator, Celestial or **Equinoctial,** is the great circle of the celestial sphere whose plane is perpendicular to the earth's axis of rotation, and the **Terrestrial E.** is the corresponding great circle on the earth's circumference, dividing it into two equal hemispheres, the northern and southern.

Equato'rial is the technical name of a telescope so mounted as to be capable of rotatory motion round two axes at right angles to each other, the one axis always pointing in a direction parallel to the earth's polar axis. Accordingly, if a star is in the field of view, it can be kept so by subjecting the telescope to one motion, viz., that round the *polar* axis, which motion, to ensure uniformity, is usually imparted to it by clockwork. The E. is of great importance in all observatories.

Eques'trian Order (Lat. *ordo equestris*), or **Eq'uites.** The term *equites* was originally used to denote, not an order in the Roman state, but the cavalry of the army. According to the Roman legend, the number levied by Romulus was 300. Each century bore the name of one of the three tribes—*Ramnes*, *Tities*, *Luceres*. Servius Tullius increased the E. to 3600, divided into eighteen centuries, the twelve new ones being formed alike of patricians and plebeians who had the necessary property qualification. Each *eques* received 10,000 *asses* (pounds of copper) to buy a horse, and 2000 *asses* annually to maintain it, and had to serve ten years. In 403 B.C., in consequence of the reverses before Veii, a number of people possessed of the requisite fortune voluntarily served without receiving a horse or a horse's allowance. These were styled *E. equis privatis*, and were not admitted into the eighteen *Centuriæ Equitum*, whose dignity was hereditary. As Rome increased in prosperity, a wealthy middle class arose, and in 122 B.C. the right of acting as jurors on criminal trials was transferred from the senators to those possessed of the *census equester*, *i.e.*, 400,000 sesterces. This new body was called the E. O., and all necessary connection between the E. and military service now ceased. For a time the senatorial order wrangled with the E. O., and in 70 B.C. Sulla deprived the latter of the *judicia*. The two orders were reconciled by Cicero during Catiline's conspiracy, but at last the E. O. joined Cæsar and the popular party. Under the Empire the indiscriminate admission of all who possessed the required fortune brought the order into contempt, and the *E. equis publicis*, having long ceased to be the regular cavalry, did little more than furnish cadets for military posts. The insignia of the E. and E. O. were the gold ring (*annulus aureus*) and the tunic with the narrow vertical stripe of purple (*tunica angusticlavia*). By the *Lex Roscia* (B.C. 67) the fourteen rows of seats in the theatre immediately behind those occupied by the senators were assigned to the E. O.

Equian'gular (Lat. 'having equal angles'), the name given to geometric rectilinear figures all of whose angles are equal one to another. Figures are also said to be E. to each other when their corresponding angles are equal.

Eq'uidæ, a family of Ungulate or 'hoofed' quadrupeds, sometimes also named *Solidungula*, and represented by the horses, asses, zebras, &c. This group of mammals belongs to the Perissodactyle ('odd-toed') group of *Ungulata*, as only one toe—the third—in each foot is fully developed. Thus the horse walks upon this single developed toe, which is provided with a broad nail termed a 'hoof.' The teeth form an interrupted series in each jaw. There are six incisors, two canines, six præmolars, and six molars in each jaw. The males alone possess canines, which are small. The skin is hairy, and a 'mane' exists. The E. are confined in present distribution to Europe, Asia, and Africa, although they have been imported into Australia and America. Fossil E. abound in later Tertiary deposits in Europe, Asia, and America. The earliest form has been found to belong to the Eocene period and the size of the animal is estimated to have been that of the common fox. This small horse possessed four well-developed toes, and one rudimentary.

Equilat'eral (Lat. 'having equal sides'), in geometry, is the name given to polygons whose sides are all equal one to another. The *E. hyperbola* has its conjugate diameters equal, bearing the same relation to the common Hyperbola (q.v.) which the circle does to the Ellipse (q.v.).

Equilib'rium (Lat. 'equal balance'), a state of rest produced by forces mutually balancing. When a material system, unrestrained by friction, is in E., the rate at which the applied forces act at the instant of passing through it is equal to the rate at which potential energy is gained. If the system is capable of being balanced in any position, its E. is said to be neutral, as is the case with a perfect homogeneous sphere placed on a plane horizontal surface; if, upon a slight displacement from its position, it returns and continues vibrating about this position, never increasing its distance from it, its E. is then said to be stable, as in the case of the same sphere placed at the bottom of a concave surface; but if the system can be displaced in any way so that its vibrations will not take place within definite limits as before, but will have the effect of making the system move farther and farther away from its original position, the E. is unstable, as, for example, an egg set upon one end, or a sphere set on the highest point of a convex surface. The mathematical conditions for these three kinds of E., in which a system may be, are as follow:—The E. is neutral when the potential energy is constant for all positions; stable when it is a minimum for that position with regard to every displacement; and unstable when it is a maximum for one, more, or all displacements. See ENERGY and STATICS.

Eq'uinoxes (Lat. 'the equality of night,' *i.e.*, with day), in astronomy, are the times at which the sun in its apparently annual motion round the ecliptic passes through the equator at the so-called equinoctial points, which are sometimes also called the E. At these times day and night are equal for all parts of the globe. The *vernal* equinox occurs about 21st March, and the *autumnal* about 22nd September. The interval of time between the vernal and autumnal E. is longer by nearly eight days than that between the autumnal and vernal, on account of the slower motion of the earth during the former period, when the sun appears in the northern hemisphere. See ECLIPTIC.

Equip'ment, Eq'uipage (Fr. from *équiper*, 'to furnish'; Old Fr. *esquiper*, 'to equip a ship'; Span. and Port. *esquife*, 'boat'; Old Ger. *skif;* Icel. *skip*, *scip*, 'a ship'), the furnishing of a ship with all technical appliances. Camp E. embraces all the technical appliances of a camp—as tents, kitchen furniture, saddle-horses, baggage waggons, &c. The E. of a soldier includes his dress, arms, accoutrements, ammunition, and provisions for a day or other fixed term.

Equipoll'ent is a term sometimes used in Scotch law to signify *equivalent*, or similarity of effect. Where a particular form is prescribed by the statute or by agreement, an E., that is, an act tantamount in effect, will not be held legal compliance with the prescribed form.

Equise'tum, a well-known genus of Cryptogams, or lower and flowerless plants, belonging to and forming a type of a natural order, *Equisetaceæ*. They are familiarly named 'horse-tails,' and a common example of the group is the 'field horse-tail,' which grows from a creeping root-stock with erect stems of both fertile and barren nature. The fertile stems are not branched, and attain a height of from 6 to 10 inches. They wither in spring, before the growth of the barren stems. Each fertile stem is topped by a little cone consisting of scales, bearing the spore-cases or sporangia on their under surfaces. The spores of E. exhibit hygrometric movements. They are provided with long processes, which coil up when moistened, but expand when dry. The barren stems in summer give off slender-jointed branches in verticils or whorls. A familiar species of E. is the Dutch rush, the outer skin or Epidermis (q.v.) of which contains so much silica or flint, that it is used for polishing pewter pots and metallic substances. The species of E. grow very rapidly, and sometimes annoy the agriculturist. Cattle appear to be injured by them, and they possess astringent and diuretic properties.

Eq'uity and Law. It is a common error to suppose that equity is administered at the discretion of the judge, according to the circumstances of each case, without regard to rule or precedents. What equity does is to do justice between parties where there is no legal obstacle. If the doing of justice will controvert a statute or established rule of common law, then equity has no power. Thus the law being that marriage revokes a will previously made, equity could not set aside this rule, however unjust might be the operation of it in an individual case. Here the law—presumably just in its general operation—must for the sake of the general good inflict an occasional hardship. It is considered expedient for public good in England that a man should be able to dispose of his estate as he chooses. This being so, suppose he makes a very unjust distribution of his property, equity cannot interfere, because were equity to interfere, the general harm done would outweigh the individual good. Plainly, every one who thought he had reasonable ground for discontent with a will would ask for the interference of the court, and the court would come virtually to be the general will-maker. But where there is no legal bar to equity, then equity will prevail. In Scotland, the Court of Session, as the supreme civil court of the country, combines in itself the functions of law and equity. The equitable power is called the *nobile officium* of the court, a term of Roman law, and is 'inherent in the Court of Session, as a Supreme Court, in cases where no provision is to be found in the law and the interference of a tribunal is necessary.' The *nobile officium*, or *judicium nobile*, of the Roman law was a limited power given to the prætor of legislative control over the law. While this power is not given to any court in England or in Scotland, many of the decisions of the supreme tribunals are necessarily legislation, from the fact that cases arise which there is no statute or ascertained rule of common law to meet. In deciding such cases, the claims of pure law and equity are adjusted on the considerations stated above; justice can be done in the individual case only so far as is consistent with laying down a rule of law which is the best rule for the public. Hence it frequently happens that the party in an appeal case who is found liable in costs is really paying for public legislation.

Eq'uity, Courts of, in England. These were the Lord Chancellor's court, the Master of the Rolls' court, and the courts of the three Vice-Chancellors. Each of these judges presided over a separate tribunal, and any causes or motions might be brought before them, except those relating to lunatics, which were always heard by the Chancellor. A Vice-Chancellor was bound to hear all those matters which the Chancellor might direct, in addition to those originally set down for hearing in his own court. The Master of the Rolls was not so bound. An important change has been effected in the constitution of the supreme law-courts of England by the passing of the Supreme Court of Judicature Acts. The Court of Chancery, of which the above constituted the divisions, was transmuted into a division of 'Her Majesty's High Court of Justice.' The judges of the divisional courts of the Supreme Court have been granted large powers in respect of the administration of E.; yet purely equitable matters are usually in the first instance tried before the Chancery divisional court. The most important form of relief given by a court of equity is that of Injunction (q.v.), which may be to restrain the adverse party in a suit from any act in violation of the plaintiff's right, or to restrain a person from proceeding with an action where it is strictly of a civil nature, or from enforcing judgment. Equity courts will interfere to prevent waste, infringement of copyright, negotiation of bills, and imitation of trade marks.

Equity of Redemption. Although by the law of England a mortgage is forfeited on non-payment of the sum borrowed at the time agreed on, equity will interfere to prevent the sale; and if the value of the mortgage is greater than the sum advanced, equity will allow the mortgagor within a reasonable time to redeem his estate, paying to the mortgagee his principal, interest, and expenses. The advantage thus allowed to the mortgagor is called the E. of R. But the mortgagee may call on the mortgagor to redeem his estate, and if he fail to do so, the mortgagee may foreclose, by which the E. of R. is lost. See MORTGAGE EJECTMENT.

Equiv'alent, Joule's, is the quantity of mechanical work required to be expended so as to raise unit mass of water at a given temperature by one degree. It will be sufficient here to give the final conclusions published by Joule, reserving to the article THERMO-DYNAMICS the history of the subject. In 1849, after six years' experiment, he thus gives his results:—'1st, The quantity of heat produced by the friction of bodies, whether solid or liquid, is always proportional to the quantity of work expended;' and '2nd, The quantity of heat capable of increasing the temperature of a pound of water (weighed *in vacuo*, and taken at between 55° and 60°) by 1° F. requires for its evolution the expenditure of a mechanical force represented by the fall of 772 lbs. through the space of one foot.' The value of gravity is that of Manchester, where the experiments were made.

Equiv'alents, Chemical. By the equivalents of substances are understood the proportions in which they combine or replace one another, these proportions being referred to a common standard, viz., 1 part by weight of hydrogen. Thus 56 is the equivalent of caustic potash, and 49 that of sulphuric acid, and therefore these quantities of the two substances unite, neither being in excess. 32·5 is the equivalent of zinc, and this quantity of zinc can replace 1 part by weight of hydrogen in 49 parts by weight of sulphuric acid, giving 80·5 parts by weight of sulphate of zinc. The term *equivalent* is now not often employed, the facts of equivalence being more readily explained by the Atomic Theory (q.v.).

Erasis'tratus, a Greek physician and anatomist, was a native of the island of Ceos, and lived in the 3rd c. B.C. After residing for some time at the court of Seleucus Nicator in Syria, he established himself as a teacher and practitioner in Alexandria, where he founded a school of medicine. The date and even the place of his death are uncertain, and only a few fragments of his numerous writings survive. The interest attaching to his name is that he narrowly escaped anticipating Harvey's discovery of the circulation of the blood. See Hieronymus, *Dissertatio Inauguralis exhibens Erasistrati Erasistraticorumque Historiam* (Jena, 1790).

Eras'mus, Deside'rius, the Greek and Latin equivalents of the Dutch **Gherærd** or **Gerard,** or **Gerrit** ('The Beloved'), born at Rotterdam, 27th October, 1467, was the son of Gherærd of Tergouw and Margaret of Zevenbergen, the sweet though painful story of whose lives has been told in Charles Reade's *Cloister and Hearth.* He was educated at Groot's school, kept by the Brothers of the Common Life at Deventer, and at Bolduc in Brabant, and then entered the Augustine monastery at Steyn. Before this both his parents had died. At Steyn he diligently read Latin authors with Wilhelm Hermann, and wrote his classical essay *De Contemtu Mortis.* But poetry was next to heresy in the eyes of the monks, whose drunken habits disgusted E. He was therefore glad in 1491 to be employed as the secretary of Henri à Bergis, Bishop of Cambrai. From Cambrai he went to the wretched Scotist College of Montaigu, of which the rector was the ascetic John Sandouck, and soon obtained a good deal of tutorial work at Paris University (Englishmen, such as Blunt and Grey, being among his pupils), where he remained till 1498, when he came to England for eighteen months. At Oxford, where Charnoch, Prior of Augustinian Canons Regular, was head of St. Mary's College, he met Thomas Linacre, the grammarian, afterwards physician to Henry VIII., William Grocyn, the patriarch of Greek learning in England, Thomas Latimer, and Thomas More; but E.'s chief friend was John Colet, the liberal theologian, with whom he had many a friendly *disputatiuncula.* The next six years he spent in Paris, Orléans, and the Netherlands. To this period belongs the *Enchiridion,* or 'Christian Soldier's Dagger,' a Platonic summary of human nature and its religious duties, with very little reference to Catholic dogma, which was, however, approved by Pope Adrian VI., then Principal of Louvain, though subsequently condemned as heretical by the Sorbonne. It was translated into all the Western languages; into English by Tyndale. About this time (1503) began E.'s acquaintance with the spiritual-minded Franciscan, John Vitrarius of St. Omer. In 1506 we find him again in England, where he saw his old friends at Oxford, and became Bachelor of Divinity at Cambridge. The same year he went to Italy, and got his doctor's degree at Turin. After a visit to Bombasius at Bologna, he went to Venice to arrange with the printer Manutius about a work on the *Wages of the Ancients,* and also about editions of Terence and Plautus, and some translations from Euripides. At Padua he met Musurus, and in 1509, after spending some time in Rome, he returned by Como, Chur, Strasburg, and Antwerp to England. Here he composed his famous *Encomium Moriæ* ('Praise of Folly'), which rivals Lucian in satire, and excels him in good humour. It was afterwards illustrated by Holbein. E. now lectured at Cambridge on Greek, and became Lady Margaret's Professor of Divinity. In 1514 he went to see the printer Froben (successor of Amerbach) at Basel, and on his way thither met Sebastian Brandt (author of the *Narrenschiff*), Bilibald Pirckheimer, the learned senator of Nürnberg, and John Reuchlin, the bold student of the Cabbala, then engaged in his strife with the inquisitor Hochstraten, who desired to burn all the Jewish literature. E. was appointed councillor to the young Archduke, Charles of Burgundy, who afterwards wished to make him a bishop in Sicily. In 1516 Froben published the first edition of E.'s Greek Testament, dedicated to Leo X. A good deal of sarcasm appears in the annotations, and also several odd blunders, such as putting *Neapolis* in Caria. Among other savage criticisms was that of Edward Lee, afterwards English Primate, who maintained the text of the three witnesses, which E., anticipating the labours of the Revision Commission (1876), had omitted. In this field E. was first, Laurentius Valla had only collated the MSS., and the *Complutensian Polyglott* of Cardinal Ximenes did not appear for some years after. The Testament was followed by the edition of St. Jerome, for whom E. had a deep admiration. After a stay at Brussels, where he had an angry correspondence with the German Budæus, he went to Louvain, superintending the administration of the Busleiden bequest. Here he met Von Hutten, who had just published one of the best of the *Epistolæ Obscurorum Vivorum,* and received his first letter from Luther. He left Louvain in 1521 and proceeded to Basel, whence he wrote his first letter of advice to the new Pope (Adrian III.), and where he quarrelled rather shabbily with Von Hutten, who wrote thereupon his *Expostulation.* This elicited E.'s *Sponge,* in which he tries to excuse himself from not actively taking part in the Reformation. E. also retaliates on Von Hutten in one of the *Colloquia,* a lively and interesting book which must be read, and cannot be described. The next pope, Clement VII. (1524), gave E. a pension of 200 florins, but the *Colloquies* were soon after condemned by the Sorbonne; and E. had to write his defiance to 'certain most impudent jackdaws.' He died at Basel, 12th July, 1536. E. was not a hero. Although amiable, industrious, and truthful, as well as learned and ingenious, he had some mean qualities. His supremacy was purely intellectual, and he believed that criticism would gradually remove the corruptions of Rome. He is, in some sense, the forerunner of the modern Broad Church party. It is a great tribute to his literary eminence that his works are still read and admired. Twenty-seven editions of the *Encomium Moriæ* appeared in E.'s lifetime; an English version, by Copner, was published in 1878. See *Life of E.*, by R. B. Drummond.

Eras'tus, Thomas, notable in medicine and famous in ecclesiastical polemics, was born at Baden in Switzerland, 7th September, 1524. The name E. is a translation of his German patronymic, *Lieber.* After an education in his native town, he studied divinity at Basel, and then medicine at Bologna. E. remained nine years in Italy, and on his return was made Professor of Physic in the University of Heidelberg. In 1581 he accepted the same chair at Basel, and died there 31st December, 1583. E. left by will a large sum for the education of poor students of medicine, and this bequest, called the *Erastian Foundation*, long perpetuated his name. His chief work is his *Explicatio Quæstionis Gravissimæ de Excommunicatione*. During his whole life E. was the vigorous opponent of those who argued that the ecclesiastical authority should punish crimes and offences. The right of excommunication was that which E. chiefly attacked, but absolution, interdiction, the imposition of penance, &c., are also discussed. From the opinions in this book the term *Erastianism* has arisen, which has been much used in Scotland, and generally misused. E. merely asserts that misdemeanours should be punished not by ecclesiastical but by civil authority, but in Scotland many people who never heard of E. are accustomed to describe as *Erastian* the policy which repudiates the doctrine of the spiritual independence of the Church. E.'s work, translated into English in 1669, was re-edited by Dr. Lee of Edinburgh in 1845. Among E.'s scientific and medical works are his *De Discrimine Logicæ et Scientiæ Demonstrativæ* (1565), *Theses de Contagio* (Heidelb. 1574), and *De Occult. Pharmaco-Potestatibus* (Heidelb. 1574).

Era'sure, or **Ra'sure,** as it is sometimes called in England, is in law the obliteration or alteration of any letter or word in a legal writing, without consent of the party bound by it, &c. In England the presumption of law, except as regards a will, appears to be, when there is an E. in a deed, that it has been made previous to execution. Should this presumption be overcome by evidence to the contrary, the deed is not necessarily void. If sufficient evidence can be adduced to prove the intention of the grantor, this will be given effect to. If this, however, cannot be done, E. proved to be subsequent to execution renders the writing void. In making a will, if there are any erasures or Interlineations (q.v.), the testator should put his initials on the margin opposite them, and 'notice them in the *attestation*.' (See Lord St. Leonard's *Handybook;* also WILL, CANCELLING.) In Scotch law, deeds or other formal instruments erased *in substantialibus* —that is, in those parts essential to their validity—are not held probative, and the defect cannot be supplied by parole evidence. An E. in a non-vital part of a deed should be declared in the body of the writing, by stating that the superscribed words are written on an E. But when correction is required from clerical error or other cause, the proper way is to draw the pen through the erroneous words so as to leave them still legible, and to add with a mark of reference the correct words on the margin, the addition being signed by the party to the deed writing his Christian name on one side and his surname on the other. (See Menzies' *Lectures on Conveyancing*, p. 124.) In bookkeeping an E. should never be made, as if the book were judicially inspected the E. might cause suspicion of fraud. An error should be deleted with the pen so as to leave the words or figures legible. The statute 6 and 7 Will. IV. c. 33, to increase the security afforded by the public records of deeds and instruments affecting land in Scotland, enacted that an instrument of sasine should not be rendered void by any part of it being written on an E., unless it was averred and proved that the E. was fraudulently made, or unless the record did not correspond with the instrument. There were, however, some exceptions to the operation of this statute, which was superseded by a subsequent enactment which provided for the registration of seisins.

E'rato ('the lovely'), in Greek mythology, one of the Nine Muses. She presided over erotic poetry and mimic invention, and is sometimes represented as the Muse of the lyre.

Eratos'thenes, a famous Greek writer, son of Aglaus, was born at Cyrene, B.C. 276. His preceptors were Aristo the Chian, Lysanius, and Callimachus. He devoted himself to grammatical criticism, philosophy, astronomy, and poetry. Ptolemy Euergetes appointed him librarian at Alexandria, a position which he filled till his death. E. was a man of most extensive and varied learning. He wrote on the *Old Attic Comedy* and on the *Homeric Poems*, composed several philosophical and historical works, raised geography to the rank of a science, founded geodesy, and made important discoveries in astronomy and geometry. His chief work was a treatise on geography, which Strabo made large use of. He measured the obliquity of the ecliptic, and was the originator of the process by which the magnitude of the earth is found. He voluntarily starved himself to death at the age of eighty, B.C. 196. For a complete list of his works, see *Eratosthenica* of Bernhardy (Berlin, 1822).

Ercill'a, y Zuñiga, Alonso de, a Spanish epic poet, was born at Madrid, or, according to others, in Viscaya, 7th August, 1533. At the age of fourteen he became page to the Prince of the Asturias, afterwards Philip II. In 1554 he came to London in the train of Philip, on the occasion of his marriage with Queen Mary. While there, E. learned that the Indians of Arauca, a district of Chili, had revolted against the Spaniards. He joined the expedition despatched to quell the rebellion, and made this war the theme of an epic. The poem, begun in 1558, was composed during the campaign, being written on scraps of paper, and even of leather, when no better material could be had. Philip, whom he had addressed as his Augustus in the *Araucana* (1569-90), treated him with neglect on his return to Spain; and the soldier-poet died at Madrid in want and obscurity some time after the year 1596. E.'s epic, the *Araucana*, is in thirty-six cantos of octosyllabic verse. Not only the subject, but the treatment also, to a great extent, is historical. The work has been praised by Cervantes and Lope de Vega. The best Spanish edition is that published at Madrid in 1828. A German translation by Winterling was published at Nuremberg in 1831.

Erckmann (Émile), and **Chatrian (Alexandre),** two modern French novelists, the former born at Phalsburg, Meurthe, 20th May, 1822, the latter at Soldatenthal, also in Meurthe, 18th December, 1826. Both belonging to the middle class, they met at the college of Phalsburg, and later went to Paris, where they set up a literary partnership, producing unitedly a series of plays and tales. After two years of hard struggling, their *Illustre Docteur Mathéus* (1859) at last stirred the public interest, which was afterwards kept from flagging by *Contes Fantastiques* (1860), *Le Fou Yégof* (1862), *Le Joueur de Clarinette* (1863), *Le Conscrit de* 1813 (1864), *Waterloo* (1865), *L'Homme du Peuple* (1865), *La Maison Forestière* (1866), *Le Blocus* (1867), *Histoire d'un Paysan* (1868), *Story of the Plébiscite* (English, 1872), and *Brigadier Frédéric* (1875). These are written in a simple, unaffected style, in harmony with the pathetic, picturesque studies of peasant life which form the background on which are dashed in vivid colours, and with realistic touch, the military glories and horrors of the Revolution and Empire. The most successful play of E.-C. is *Le Juif Polonais* (1869), produced in England as *The Bells* (1871), rendered popular by the acting of Sir Henry Irving.

Er'ebus, the son of Chaos. The name signifies darkness generally, and is specially applied to the gloomy region of the under-world through which the shades pass to Hades.

Erech'theus or **Erichtho'nius,** and **Erechthe'um.** Erechtheus or Erichthonius is reputed to have sprung from Attic soil in marriage with Hephæstus. He was reared by Athena. When grown up, he usurped the government of Athens, instituted the worship of Athena, and built her a temple on the Acropolis. This temple, called after him the *Erechtheum*, was the most revered of all the Athenian sanctuaries. It contained the olive-wood statue of Athena Polias that was said to have fallen from heaven, the sacred olive-tree which the goddess called forth in her contest with Poseidon, the tombs of Cecrops and of E. himself. It was burnt by the Persians, but was replaced in the beginning of the 4th c. B.C. by an Ionic structure, one of the triumphs of Athenian architecture. By his wife Praxithea E. had four sons and four daughters. The daughters, Procris, Creusa, Chthonia, and Orithyia, agreed that if one of them were to die the others should not survive her. When Chthonia was sacrificed for the welfare of Athens, two of her sisters kept their vow. The legend of Chthonia is beautifully told in Swinburne's tragedy of *Erechtheus*.

Erec'tion, Lords of. Those to whom the king, in Scotland, after the Reformation made grants *jure coronæ*, of the lands or tithes which had formerly belonged to the Popish ecclesiastical establishment, were so entitled, because under their grants they had the same rights to the erected benefices which were formerly vested in the Church. Sometimes those so gifted were called titulars of the tithes. Those grants were made under the burden of providing competent stipends to the Reformed clergy. See TEINDS.

Er'emites (Gr. *ērēmites*, from *ērēmos*, 'lonely,' 'desert'), or **Her'mits,** the name of the early Christian solitaries, who in the East, and especially in Egypt, withdrew to the desert, and spent their lives in lonely prayer, rigorous abstinence, and often in self-mortification. (See ANCHORITES and ASCETICISM.) This practice of retirement began in the 2nd c., and became common in the first half of the 4th c. It may have been suggested by the *Therapeutæ* (q.v.). The severe watchings and fastings of these recluses often gave rise to insanity, and an asylum for such as were incurably deranged was established at Jerusalem. From the strange hallucinations to which they were subject much of mediæval demonology originated. The E. were strict observers of celibacy, and gradually gathered into monastic communities, the first of which is said to have been founded by Hilarion. (See MONASTICISM.) A famous eremite was soon surrounded by imitators, who were formed into a cœnobite community, while many E., who did not join the monastery, girt it with a *laura* or circle of separate cells. E. were common during the Middle Ages, when they gathered into brotherhoods, of which the most famous were the Hermits of St. Augustine. See Helyot's *Histoire des Ordres Religieux*, and Lecky's *History of Rationalism*.

Er'furt (anc. *Erpisford*, 'the ford of Erpe'), the old capital of Thuringia, now a town of the province of Saxony, Prussia, on the Gera, in a fertile plain, 14 miles W. of Weimar by rail. E. was formerly a fortress of the second rank. Its original fortifications have been strengthened by two citadels and other outworks. Among the most noteworthy buildings are the Gothic cathedral, with a portal of the 12th c., and the great Susanna, one of its ten bells, weighing 275 cwt.; the Severikirche, of the 14th c., with three copper-covered towers; the Augustinian monastery (now an orphanage) in which Luther was a monk, and the Town Hall, opened in 1876 and built at a cost of £37,000. Of the university, suppressed in 1816, there still remain the observatory, the anatomical theatre, and the botanic garden. In the fish-market is a monument to Roland. E. has important manufactures of woollens, cottons, silks, ribbons, hosiery, carpets, tapestry, leather, tobacco, chemicals, ironmongery, and machinery. In the neighbourhood of E. is a rock-salt mine. Only an insignificant place in the 8th c., at the end of the 16th c. it was a Hanse town, and twice as large as it is now. Pop. of town 72,360.

Ergot.

1, Ear of rye, with Ergot (spurred rye); 2, Ergot; 3, Diseased grains of rye.

Er'got, a powerful and important therapeutic agent, obtained chiefly from *Secale cereale* or common rye, by the action of a fungus which changes the appearance and constitution of the grain, and thus forms *Secale cornutum* or 'spurred rye.' The fungus which produces E. is found in other grasses (*Lolium arvense* and *L. perenne*, &c.), but does not produce such characteristic effects as on rye. The E. fungus consists of a mass of polygonal cells containing an oily fluid. It appears within the seed or ovule of rye, and propagates itself at the expense of the seeds. Whatever doubts may exist as to the nature of the E. producing fungus, none exist regarding the powerful action of the substance itself. The active principle of the E. appears to exist in a fixed oil, of which it contains about 35 per cent. The active substance is *ergotine*, a reddish-brown substance, of which E. contains about 15 per cent. The therapeutic properties are extracted by alcohol and water. E. is first mentioned as a therapeutic agent by Camerarius in 1668, and in 1669 by Bautzmanni. In 1774 its use was prohibited by law in France, on account of its reputed virulence, but in 1777 Desgranges of Lyon again used E. and extolled it as an obstetric aid. The action of E. generally sets in at various periods, varying from five minutes to half-an-hour, and is supposed to be due to a special effect on the muscular fibre, but there is little doubt that it also acts on the spinal cord and nerve-centres generally. Dr. Tyler Smith says that the blood is the medium through which E. specially acts. When taken in a poisonous dose, E. appears to induce the state termed *ergotism*, characterized by depression, coldness, and gangrene or mortification of the extremities, or by convulsions. The latter form of ergotism was seen at Silesia in 1722, and at Berlin in 1723, being induced by eating bread made from ergotised rye. Pain, itching, and tingling in the feet were first observed, convulsions followed, and mania or coma in turn succeeded.

Er'iach. By the Irish Brehon Law, in a case of murder, the brehon or judge caused the murderer to give the wife or child of the murdered man a recompense, called an E. The term corresponds to the ancient *were* in England.

Erica'ceæ, or **Eri'ceæ,** a natural order of Exogens, including the heaths and allied species of plants. These plants are widely distributed in arctic and temperate zones in both hemispheres, save in Australia. They are found on the mountain ranges of the tropics. The genus *Erica* itself is very common in S. Africa. The British genera number seven, with twenty-three species. The E. are wiry shrubs, with eight or ten stamens, the latter being epigynous or hypogynous. The ash-coloured E., a Scotch heath, and a familiar example of the order, is a low bushy shrub, with linear leaves and racemose clusters of purple flowers. The corolla is persistent in many heaths, the anthers dehiscing, or opening by superior pores. The fruit in the heaths is a capsule. Amongst other genera of this order are the Rhododendrons (q.v.), azaleas, kalmias, ledum, &c.

Er'icht, or **Err'ocht, Loch,** in a dreary waste partly in Perthshire and partly in Inverness-shire, at the foot of Ben Aulder, one of the Grampians, and about 1500 feet above the sea-level. It is about 15 miles long by 1 broad, and has communication with Lochs Rannoch and Lydoch. E. is said never to freeze.

Er'icsson, Johan, a Swedish engineer, born 31st July, 1803. He came to England after serving some years in the Swedish army, and took an active part in the introduction of the screw-propeller about 1837. In 1839 he went to America, where he perfected his caloric engine in 1852, and constructed the ironclad *Monitor* in 1862. Died 9th March, 1889.—**Nils E.,** brother of the preceding, born 31st January, 1802, was head of the corps of Swedish naval engineers from 1850. He also constructed the Swedish railways (1858-63), the canal between the Saiman and the Gulf of Finland, and improved the Stockholm docks, &c. In 1860 he was made a baron, and died 8th September, 1870.

E'rie, a town of Pennsylvania, on the shores of Lake E. Its harbour, one of the best on the lake, is formed by Presque Isle, 4 miles long. The bay is 3½ miles long, from 9 to 25 feet deep, and is well protected by a breakwater. E. is also connected with the Ohio by a canal, and is the terminus of the Philadelphia and Erie Railway. Pop. 40,634.

Erie Lake, one of the five great lakes of N. America which give rise to the St. Lawrence, and with it form an unrivalled channel of inland navigation. It is fourth in size and position, having the larger lakes Superior, Michigan, and Huron above, and Ontario, the smaller, below it, with the province of Ontario on the N., and the states of Ohio, Pennsylvania, and New York on the S. E. has a length of 240 miles, with an area of 9600 sq. miles, and it is 555 feet above the ocean. It has a mean depth of only 120 feet, rendering storms frequent and navigation dangerous. The chief United States towns on its shores are Buffalo, Dunkirk, Erie, Cleveland, Sandusky, Port Clinton, and Toledo; the Canadian, Ports Dover, Burwell, and Stanley. The current of Niagara, running northward, carries the waters of the lake into the Ontario. Ice interrupts navigation from December till March or April. The Welland Canal connects E. and Ontario, and numerous railways and canals render the lake a busy scene of traffic.—*E. Canal*, a work of great utility, extends from the Hudson above Albany to Buffalo on Lake E.—*E. Railroad*, one of the chief routes to the W., extends from Jersey city near New York to Dunkirk on Lake E.

Erig'ena, Joannes Scotus, a mediæval philosopher, and, according to Hallam, 'the greatest man of the dark ages,' was born in Ireland—hence the name E.—in the beginning of the 9th c. He spent his life, which is veiled in obscurity, chiefly at the court of Karl the Bald, in whose palace-school he seems to have been a teacher, and died about 875. He was the founder of mediæval philosophy, but differs broadly from the later scholastics, who were rigid followers of Aristotle and devoted to casuistic hair-splitting, while E.'s works are imbued with Neo-Platonic idealism. He held that nature was the manifestation of God under certain forms; that God was the vital essence pervading all things. The audacity of some of his propositions was perhaps only partly visible to himself. He declared reason to be prior in time to authority, and all authority which was not based on reason to be worthless. His chief writings are *De Divisione Naturæ*, a pantheistic treatise (Oxf. 1681, and Munst. 1838); *De Divina Prædestinatione*, a work on theology (1650); a translation and commentary on the works ascribed to Dionysius the Areopagite; a homily, several pieces in verse, a treatise on the Eucharist, and a small work, *De Visione Dei*.

Erig'eron, a genus of plants of the natural order *Compositæ*. The bitter E. is a common British species, familiarly named 'fleabane,' from its odour being said to keep away fleas and other insect pests. This species is about 16 or 17 inches high, and its flower-heads exhibit pale-blue 'ray' florets, those of the centre being yellow. An American species, the Philadelphian E., has ray florets of a purple hue, and possesses diuretic properties.

Er'ik, a common name of Danish, Swedish, and Norwegian kings.

1st, *Danish*.—**E. Barn** ('the child' or 'bairn'), 840-860, began the Danish system of foreign invasions.—**E. Ejegod** (or 'good for the eyes'), one of the fourteen sons of Svend Estridsen, whose line followed the old line of Gorm, ascended the throne of Denmark in 1095. Driven from home when his eldest brother, St. Knud, was murdered at Odense, E. had travelled and acquired many languages. He cleared part of the Danish coast from the Wendish pirates, and encouraged the formation of the early guilds. Having killed a servant, he undertook, with his queen Botilda, a pilgrim to Jerusalem (although his loving people offered one-third of their substance as a blood-fine), but died at Cyprus, 1103.—**E. Emun** (or 'the Boaster'), a younger son of Ejegod, appears in history as the avenger of his brother Knud, whom the king Niels and his son Magnus had treacherously killed at Ringsted in 1134. The Boaster appealed to the 'Thing,' who gave him help; and thus he won the battle of Fodevig in Skaania. Niels fled and E. became king. Although successful against the Wends, he tarnished his memory by the murder of his brother, Harald Kezia; and his son, E. 'the Lamb,' was a monkish coward, who died in 1147, leaving Denmark a legacy of ten years' civil war, in which the *Bondar* or free peasants were oppressed. E. introduced the use of cavalry to Denmark.—**E. Plov-penning** (or 'plough-money,' so called from an unpopular tax imposed on ploughs') was the eldest surviving son of Valdemar II. He succeeded his father in 1241, and in 1250 was murdered at the instigation of his brother Abel, Duke of Slesvig, who, along with Christopher of Laaland and Nikolaus of Halland, had kept the land in continual dissension.—**E. Glipping** (or 'the Blinker'), the son of Christopher I. and Margaret of Pommern, succeeded his father on the throne in 1259. He conceded certain rights of jurisdiction to the nobility and clergy. E. was a weak, vicious king, and was murdered in 1286.—**E. Menved** (or 'with a but,' so called because he could not resolve on anything), the son of the preceding, succeeded to the throne, which was for some time practically occupied by his mother, Agnes of Brandenburg. The chief murderers of the late king, Stig and Raul Jonsen, were punished. Expensive wars with Poland and Norway led to the gradual alienation of the crown-lands, till most of the herring-fisheries were sold to the Hanse traders. E. had fourteen children by Ingeborg of Sweden, but they all predeceased their father, who died in 1319.

2nd, *Swedish*.—**E. Sejersoel** ('the Victorious'), a descendant of Ragnar Lodbrog and Björn Jernside ('Ironside'), reigned in Sweden from 983 to 993. He defeated the pagan Vikings of Jomsborg, and, according to Adam of Bremen, even conquered Svend Estridsen, the King of Denmark. The heroic song of Hjalteson, celebrating E.'s victory of Fryisvall, is one of the oldest monuments of Sweden.—**E. IX.** ('the Saint'), a member of the peasant class, succeeded in 1155 to the throne of Sverker I., who had just by negotiation with Cardinal Albinensis brought the Swedish Church into close communion with Rome. E. had three rules of policy—'to build churches, to govern according to law and right, and to overpower his enemies.' He was also called *Lag-gifware* ('lawgiver'). He warred against the Finns, and compelled them to accept Christianity. E. was killed by the Dane, Magnus Henriksen, in 1160.—**E. Knutsson** (or *Arkonung*, 'good years'), grandson of the preceding, after the long struggle between the Sverkers and the Bondars, received the Swedish crown by the help of the Church (1210). As a recompense, he surrendered part of a royal right (*sakören*) to the clergy. His son, **E. Læspe** (or 'the Halt'), nominally ruled in Sweden from 1222 to 1250.—**E. XII.**, the son of King Magnus of Sweden and Norway, was constantly disputing the sovereignty with his father till his death in 1359. **E. of Pommern** was the nephew of the wise and good Margaret, widow of Hakon of Norway, and mother of Olaf of Denmark. This remarkable woman, after the Kalmar Act of Union in 1397, conjoined E. with herself in the enjoyment of the triple crown. Margaret died in 1412, just after concluding a peace with Holstein, which E. disregarded, and commenced a cruel war that lasted twenty-five years. In 1423 the Emperor Sigismund decreed that the territory of Slesvig should be given to E., but instead of taking advantage of this, he went off on a crazy expedition to Jerusalem. A dalesman called Engelbrecht now stirred up a rebellion in Dalekarlia and Westmannland, and compelled the Council of State at Stockholm to sign a deed saying that E. had broken his coronation oath. The nobles did not join this popular movement, but in 1436 agreed to a new Act of Union of the three kingdoms. In 1439 all Sweden revolted under the viceroy Karl Knudsson Bondar, and Denmark and Norway deposed E. in favour of Christopher of Oldenburg.—**E. XIV.** was the son of the hero Gustaf Vasa and Katharine of Sachsen-Lauenberg. When he succeeded his father in 1560, he was on the point of starting for England to ask Elizabeth to marry him, a match in which Calvin interested himself. He was accomplished, but passionate, much under the influence of French acquaintances. He challenged Leicester to single combat, and afterwards sent 10,000 dollars to his envoy Gyllenstjerna that he might get rid of his rival. E. plunged into a seven years' war about a question of armorial bearings with Frederik II. of Denmark, and under the evil counsel of Göran Persson committed great excesses, and finally fell into madness, from which he was rescued by a peasant girl, Karren Mannsdatter, whom he married in 1567. By a combination of his brothers E. was, in 1569, brought to trial before the assembled states, and declared to have forfeited his own and his children's rights to the throne. He died by poison in prison eight years later, leaving a strange diary of the later events of his reign.

3rd, *Norwegian*.—**E. Blod-öxe,** the eldest son of Harald Haarfager, succeeded his father on the throne of Norway in 936. Shortly after, on account of their cruelty, he and his queen, Gunhild, were driven away. They took refuge at the court of Æthelstan, in England, where E. was made ruler of the sub-kingdom of Northumbria. His son, **E. Graafell,** was king for some years (963-977), and his son's half-cousin, **E. Jarl,** obtained the crown in 1000, after defeating Olaf Trygvassen in the great sea-battle of Svold, on the coast of Pommern. To this period belonged E. Raudi (or 'the Red'), who, with his son Leif, founded in Greenland the colonies of *Oestre Bygd* and *Vestre Bygd*, afterwards destroyed by the black death. The Icelandic chronicles assert that Leif, or his successors, passed over to Nova Scotia and S. Canada, which they called Vineland. The last Bishop of Greenland was sent in 1448.—**E. Præstehader** (or 'priest-hater'), the eldest son of Magnus *Laga-bæter* ('law-betterer') and Ingeborg of Denmark, succeeded his father in 1280. He did little but quarrel with the Danes and Scotch about the dowries of his mother and daughter (Margrete, the Little Maid of Norway), with the Hanse, and with the clergy, whose exemption from taxation he discontinued.

Erinn'a, a famous Greek poetess, was born at Rhodes or the adjacent island of Telos, about 612 B.C. Common tradition makes her the contemporary and friend of Sappho, credits her with beauty and genius, and places her on a level with Homer. She excelled in epic poetry, and also wrote lyrics and epigrams. One of her pieces, *The Distaff*, written in a dialect that is a mixture of Æolic and Doric, consisted of 300 lines. E. died at the age of nineteen. She had a place in the *Garland* of Meleager, in which the crocus, on account of its maiden paleness, was the emblem assigned to her.

Eriocaula'ceæ, or **Eriocaulona'ceæ,** the 'pipewort' order of Monocotyledonous plants, inhabit marshes. They have small unisexual flowers, with two-celled anthers, and an ovary, surrounded by a toothed and membranous tube. S. America is the chief habitat of the E. The only British species is the 'jointed pipewort' found in Galway and Skye. Some of the Brazilian species of Eriocaulon are branching plants, which sometimes attain a height of over six feet. Over 200 species of E. are known.

Erioden'dron, a genus of Exogenous plants belonging to the natural order *Sterculiaceæ*, the 'silk-cotton' order. *E. Samanna* is a typical tree of the American *selvas*, and exceeds all other trees of the Amazon forests in height. It rarely branches till it has grown above the other trees. The genus closely resembles the species of *Malvaceæ* (or cotton order) in general characters, the seeds being embedded in a woolly matter. The Indian E. and the winding E. occur in the E. Indies, and the Guinea E. in Africa.

Erioph'orum, or **Cotton Grass,** a genus of Endogenous plants belonging to the *Cyperaceæ*, or sedges. These plants derive their familiar name from their long silky or cottony hairs round the fruit. The leaves have astringent properties. The silky filaments are used for making candle-wicks, and for stuffing cushions. One species is the common sedge, and exists as a grass-like herb, the flowers of which are arranged in spikes.

Er'ith, a small town of Kent, on the right bank of the Thames, 14 miles S.W. of London. Belvedere House, a hospital for merchant seamen, was formerly the residence of Sir Cullen Eardley. Here are powder-mills, lime and sand pits (for ships' ballast), and extensive brickfields. After the signing of the Magna Charta the barons met Hubert de Burgh at the old church of E., and arranged the conditions of peace. The *Grace de Dieu*, the fine battleship built by Henry VIII., was constructed at E. in 1515. Pop. civ. par. 13,414.

Erivan', the capital of the Russian government of E., in the lieutenancy of the Caucasus, on the Zenghi, 110 miles S.W. of Tiflis. It is a fortified town, on a bare plateau 3530 feet above the Black Sea. The houses are mean, and the streets narrow and unpaved. The fort stands on a basalt rock not far from the town. The inhabitants are engaged in agriculture and gardening, and a few of them in commerce. Fruit and vines thrive well, and there is a considerable trade in dried apricots. E. was founded in the time of Timur: its fortress was built in the beginning of the 16th c. by Khan Rewan, who named it after himself. E. was formerly the capital of the Persian province of Aran, and played a prominent part in the wars between the Turks and the Persians from the 16th c. downwards. The Russian general Paskevitch took E. by storm in 1827; and in 1828 it was ceded to Russia, along with the province of the same name. E. suffered greatly by the earthquake of July, 1840. Pop. 17,050.—The *government* of E. has an area of 10,075 sq. miles, and a pop. of 703,511.

Erivan.

Erlang'en ('the dwelling near alder-trees'), a walled town in Middle Franconia (Mittelfranken), Bavaria, on the Regnitz, and on the Ludwig Canal, 12 miles N. of Nürnberg by railway. It consists of an old and a new portion, the latter having been built since a great fire in 1706. The famous Protestant university, founded here in 1746, is the principal building. It bears a high character as a school of orthodox theology, is attended by some 500 students, and has a library of 152,000 volumes, besides valuable scientific collections and botanical gardens. E. has large manufactures of cottons, hosiery, mirrors, tobacco, and is particularly famous for its beer, of which it produces 1,500,000 gallons yearly. E. was one of the asylums for the French refugees on the revocation of the Edict of Nantes. Pop. 12,723.

Er'lau ('alder-tree meadow'), a walled city of Hungary, on a river of the same name, 75 miles E.N.E. of Buda-Pesth by railway. It is the seat of an archbishop, has a beautiful cathedral in the Grecian style, a lyceum with a large library, several monasteries, a richly-endowed hospital, and carries on an active trade in a celebrated red wine. The inhabitants are mostly Roman Catholic Magyars. A bishopric, founded at E. in the 11th c., was made an archbishopric in 1804. Pop. 21,070.

Ermenonville, a village of France, in the department of Oise, 17 miles S.E. of Senlis. It was early a seigneurie, and was made a vicomté by Henri IV., whose mistress, Gabrielle d'Estrées, lived here. The Marquis René de Girardin acquired the grounds in 1763, and the château was subsequently the residence of Rousseau, who died here, 3rd July, 1778, and whose tomb on the Île des Peupliers is resorted to by many visitors. The beautiful park, which attracts so many Parisians in summer, has of late fallen into disrepair. Pop. 487.

Er'mine, or **Sto'at,** a species of carnivorous mammalia, belonging to the *Mustelidæ* or weasel family. It attains a length of about 14 inches. The summer colour of the animal's fur is not unlike that of the weasel, the prevailing tint being a pale brown tinted with red, the toes and edges of the ears being white. In winter the fur undergoes a remarkable change, then becoming of a uniform white hue, or sometimes of a yellowish-white colour. The E. is accordingly with difficulty detected amid the snow. This animal inhabits Britain, especially in its N. parts, but also occurs in Siberia, N. Europe, and N. America. It is much sought after in winter on account of its fur, which is greatly valued. The præmolar teeth number eight in each jaw.

Ermine (with winter coat).

Ermine, in heraldry, is a field *argent* with a small *sable* pattern formed of spots and small triangles spread or powdered over it. *Ermines*, also called *contre-E.*, is a field *sable* with *argent* pattern powdered over it. *Erminois* is a field *or* powdered *sable* (Boutell and Aveling).

Erne (Gael. *Eirne*, so called from a tribe of the Firbolgs), the name of a river and two lakes in the county of Fermanagh, Ireland. The river rises in Lough Gowna, and after a N.W. course of 72 miles, during which it traverses Lough Oughter and Upper and Lower Loughs E., falls into Donegal Bay. It is navigable as high up as Ballyshannon. Upper Lough E., 12 miles long by 4½ broad, is one of the most picturesque lakes in Ireland. Lower Lough E. is 20 miles long and 7½ broad. The former has 90 and the latter 109 islets. Both loughs abound in salmon and trout, and are the haunts of numerous wildfowl in winter. Beautiful country-seats enliven the banks.

Erne, the name given to certain species of Raptorial birds belonging to the family *Falconidæ*, and which are also known under the name of 'eagles.' The common E. is also known as the white-tailed or sea eagle; a bird which is common in Britain, and is a good example of the larger species of the family. This bird attains a length of three feet, and may measure over six feet in expanse of wings. The colour is dark brown, the rounded tail being white, the primary quills black, and the legs, toes, and beak yellow, whilst the head is furnished with elongated feathers. The food consists of fishes, but the E. is also known to seize the smaller animals. Another species of E. is that called by the name of bald or white-headed eagle of America, known by the white head and neck, by the deep-brown body, and by the white tail and tail-coverts.

Ernes'ti, Johann August, a German philologist and theologian, born at Tennstädt, Thuringia, 4th August, 1707. He studied at Leipzig, where he became Professor of Ancient Literature in 1742, of Eloquence in 1756, and of Theology in 1759, and where he died, 11th September, 1781. E. was an excellent linguist, and so graceful a Latinist as to be styled 'the German Cicero.' He introduced a new system of Biblical criticism, examining the grammar and style of Scripture in the manner applied to Greek and Latin classics. His chief works are an edition of *Cicero*, and grammatical criticisms of the Scriptures.

Ernst, Elector of Saxony, and founder of the Ernestine line of Saxon princes, was born at Altenburg, 25th March, 1441. He and his younger brother Albrecht were the victims in the episode known in German history as the *Prinzenraub* ('the stealing of the princes'). E. succeeded his father in 1464, ruled the entire principality conjointly with Albrecht for twenty-one years, and added Thuringia to his dominions in 1482. He eventually divided the territory with Albrecht, the founder of the Albertine branch of the family, and died at Kolditz, 22nd March, 1486. Among the later descendants of the stolen E. was the late Prince Consort, Albert of Saxe-Coburg.—**Ernst I.,** Duke of Saxe-Gotha and Altenburg, and founder of the house of Gotha, born 24th December, 1601, was the brother of the famous Bernhard of Weimar (q.v.), and a member of the Ernestine line of Saxony. He served with distinction in the Thirty Years' War as a colonel of horse under Gustavus Adolphus, and shared in the Protestant victory of Lützen (1632). After the battle of Nördlingen (1634), E. was long engaged in improving and remodelling his possessions, which had suffered terribly from the ravages of war. Many existing institutions are traceable to his wise and able rule, while his severe Lutheranism gained for him the surname of 'the Pious.' He died 26th March, 1675. His line terminated in the death of Friedrich IV. in 1825.

Ernst, Heinrich Wilhelm, a German composer and violinist, born at Brünn in 1814. He first appeared before the public as a boy, and during upwards of twenty-five years played in the principal Continental cities and in London with very great success. His health compelled him, about 1858, to go to Nice, where he died, 8th October, 1865. His principal compositions are for the violin.

Er'ode (Iródu), a well-built town in the district of Coimbatore, province of Madras, British India, 243 miles S.W. of Madras by rail and 55 N.E. of Coimbatore. It is situated on a canal issuing from the Bhawani, not far from the confluence of that river and the Kaveri. Owing to successive invasions by Marrathas, the forces of Mysore, and the British, the inhabitants were scared away from the place, but so soon as peace was declared they began to return. The chief trade is in cotton, rice, saltpetre, and chillies. A fine bridge of twenty-two arches spans the Kaveri near the town. E. has some place in early history, but its modern importance is due to its being the junction of the South Indian Railway with the main Madras line. Pop. 12,330, of whom 10,481 are Hindus, 1393 are Mohammedans, and 453 are Christians.

Er'os, the Greek name of Cupid (q.v.).

Ero'sion (Lat. *erosio*, 'a gnawing or eating away') is the name applied to the action of ice or running water upon the surface of the earth, giving rise to the striated surfaces and *roches moutonnées* indicative of Glacier (q.v.) action, and cutting out ravines and valleys of varied appearance and magnitude. In the case of streams, it is not as a rule so much to the running water itself that E. is due as to the salts which it contains in solution and the particles of sand and mud which it holds in suspension. If the water were absolutely pure there would be no chemical, and little, if any, mechanical, action. E. is also an expression used in reference to explosives. See CORDITE.

Erot'ic (Gr. *erōs*, 'love') signifies whatever relates to the passion of love. Thus Alcman, Sappho, Anacreon, Catullus, &c., whose chief theme is love, are termed E. poets, and their love-lays E. poetry. The title E. writers (*scriptores erotici*), however, is generally employed to describe the class of Greek romancers whose tales were the legitimate precursors of the modern novel. E. romance was doubtless a birth of the East—the Song of Solomon combines the passionate intensity of a hymeneal with the colour, fancy, and pictorial profusion of the most exquisite romance—but the earliest specimens of it which appeared in the Western world were the famous *Milesian Tales*, a collection which seems to have been as popular in its own day as was the *Decameron* in the Middle Ages. The E. writers flourished at a late period of Greek letters, and are generally inferior in style to the recognised 'classics'; but their aim was to please and to amuse, and doubtless their works were as eagerly sought after in the libraries of the 'Sosii' of the time as the latest novel now is at Mudie's. Of the E. writers may be mentioned Parthenius, Iamblichus, Alciphron, Xenophon the Ephesian, Aristænetus, Heliodorus, Longus, and Achilles Tatius in Greek, and the Latin writer Appuleius, whose *Golden Ass* contains many merry tales and the pre-eminently beautiful episode of *Cupid and Psyche*.

Erpe'nius, or **Van Erpen, Thomas,** born at Gorkum, 7th September, 1584, on the suggestion of J. J. Scaliger, devoted himself to Oriental languages. For this purpose he travelled to the great seats of learning, meeting Casaubon at Paris, where he acquired Arabic from an Egyptian. At Venice he picked up Persian and the Turkish and Ethiopian dialects from some resident natives. He then taught Arabic and Hebrew at Leyden, and received the important post of Oriental interpreter to the States-General. He reached singular purity and elegance in Arabic composition. E. died 13th November, 1624. His chief work was an Arabic Grammar, a classical text-book till superseded at the beginning of this century by that of De Sacy. His Arabic printing-press at Leyden produced several works, such as *Two Centuries of Arabic Proverbs*, *Fables of Locman*, an Arabic Pentateuch, the Chronicle of Elmakin, &c. E. also wrote on the Hebrew and Syriac grammars.

Erran'tia, an order of *Annelida* (q.v.) or worms, represented by such genera as *Nereis*, *Eunice*, *Aphrodite*, &c. This group includes those forms which typically represent the *Annelida*, and which comprise the greater number of large active marine worms. The sides of the body are well provided in E. with the lateral appendages, consisting of *setæ* or bristles, &c., which assist locomotion. Each joint or segment of the body bears two pairs of appendages, known respectively as *notopodia* and *neuropodia*. The gills or breathing organs are borne on the back or dorsal aspect of the segments. These animals are unisexual. The integument is soft.

Erra'ta (Lat. 'errors'), the list of errors which may have arisen in the printing or in the composition of a work with their corrections, inserted indifferently at the commencement or at the end of the book. Typographical errors are now comparatively rare in printing-offices of any character. Formerly they were sometimes introduced intentionally, that the author might express as corrections of E. sentiments which he durst not exhibit in the body of the work. (See Disraeli's *Curiosities of Literature*, vol. I. Lond. 1865.) Several ludicrous E. are known. The Vinegar Bible, printed at the Clarendon Press in 1717, is so called because in it the 'Parable of the Vineyard' is printed the 'Parable of the *Vinegar*.' The Stationers' Company incurred a heavy penalty for issuing an impression of the Bible in which the word 'not' was accidentally omitted from the Seventh Commandment.

Errhines are medicines administered to produce sneezing and discharges from the nostrils, to relieve headaches and deafness depending upon obstructions in the Eustachian tube, as common snuff, powder of *Asarum Europæum*, and *Helenium autumnale* (sneeze-wort).

Error in Essentials. An error in an essential point vitiates a contract, on the ground that consent—on which the validity of all contracts depends, without which there can be no contract—has been only apparent. But the legal difficulty lies in determining what is an essential. *Error calculi* (error in calculation) may always be rectified. See CLERICAL ERROR.

Error, Proceedings in, the form in England by which an appeal was made to the superior court against the judgment of an inferior court. The Judicature Act of 1875 (Order LVIII.) abolished P. in E., except in criminal cases, and in civil cases the course is by way of appeal. See APPEAL; ERROR, WRIT OF.

Error, Writ of. In criminal cases, the judgment of the tribunals, sessions or assizes, may be reversed by the Queen's Bench divisional court if there be some substantial defect in the indictment or error on the record. Before these proceedings can be taken, the Attorney-General's permission must be obtained. The Attorney-General may confess error, and in that way consent to the judgment being reversed. See ERROR, PROCEEDINGS IN.

Errors of Observation may be divided into avoidable and unavoidable errors. The former can easily be eliminated by comparison with other observations; and to such belong, for instance, reading the number of degrees, minutes, &c., wrongly; but the latter class comprehends cases of a much more difficult nature, arising from the imperfection of the instruments in use, refraction, temperature, atmospheric pressure, the observer's own so-called personal error, and such like. Thus the astronomer has a number of observed values for the position of a star which most probably differ perceptibly from each other. How, then, is he best to combine these results to obtain the most probable value? The simplest method is, of course, to take the mean, and this is sufficiently true if the observations are all equally reliable, but if they be not so, they must first be reduced to the same weight by the employment of a proper factor. In comparing the observed position of a planet with its calculated position, the difference depends not only on the E. of O., but also on the errors of the elements assumed in the calculation. Cases of this last kind are much more difficult; but for further information reference is made to the article LEAST SQUARES, METHOD OF. Airy's *E. of O.* is an excellent treatise on the subject.

Ersch, Johann Samuel, known as the founder of German bibliography, was born at Grossglogau, in Lower Silesia, 23rd June, 1766. He studied at Halle and Jena, and became Professor of Geography and Statistics at the former university in 1803. Among his works are a *Handbuch der Deutschen Literatur seit der Mitte des 18ten Jahrh, bis auf die neueste Zeit* (1812-14), the *Allgemeines Repertorium der Literatur* 1793-1809), and *La France Littéraire* (1797-98, with two supplementary vols. 1802 and 1806). Along with Gruber he began the *Allgemeine Encyclopädie der Wissenschaften und Künste* (1818, still unfinished). E. died at Halle, 16th January, 1828.

Erse, a corruption of *Irish*, formerly used by the Lowlanders of Scotland as a synonym for *Gaelic*, in allusion to the Irish origin of the Western Highlanders. Thus Burns, in his *Address to the Deil*, says—

> 'But a' your doings to rehearse,
> Your wily snares and fechtin' fierce,
> Sin' that day Michael did you pierce
> Down to this time,
> Wad ding a *Lallan* tongue or *Erse*,
> In prose or rhyme.'

Erskine, Ebenezer, Rev., an evangelical divine of the Church of Scotland, afterwards founder of the Secession Church, was a son of the Rev. Henry E., minister of Chirnside, a descendant of the Sheilfield branch of the Mar family. E. was born 22nd June, 1680, and entered Edinburgh University in 1693, taking his degree in 1697. He was licensed to preach in 1703, and soon after ordained minister of Portmoak. There he laboured for twenty-eight years with great assiduity, and laid the foundations of a wide popularity. He removed to the West Church of Stirling in 1731, and in the following year signalised himself by opposing an Act of the Assembly which he deemed favourable to error in doctrine and discipline. He preached against the prevalent 'defections,' in a sermon before the Synod of Perth and Stirling, and incurred the censure of the Church. He resented this, and while still holding the principle of a National Church, with a few other ministers set up the Secession Church in 1733. Fruitless efforts were made to restore unity, and in 1740 he was deposed. When the Secession was rent in twain in 1747, E. took the side of the Burghers, and was duly excommunicated by his late followers. He died 22nd June, 1754. E. was a preacher of great unction and a man of genuine piety.—**Rev. Ralph E.,** brother of Ebenezer E., was born in Northumberland, 18th March, 1685, studied at Edinburgh University and was ordained Minister of Dunfermline in 1711. He took the same side as his brother in the Church controversy, assisted in the formation of the Secession, and was deposed in 1740. He died 6th November, 1752. E. is the author of *Gospel Sonnets* and *Faith no Fancy*. The names of both brothers are still warmly cherished by the Scottish people.

Erskine, Harry, son of the tenth Earl of Buchan, and elder brother of Lord-Chancellor E., was born at Edinburgh 1st November, 1746, and called to the Scotch bar in 1768. Though not a great lawyer, his other gifts soon put him in the front rank of his profession, and made him one of the most popular men in Scotland. He was honourably distinguished for the attention he gave to the cases of poorer clients, and by the independence and consistency of his political principles. He acted as Lord Advocate under the short-lived Rockingham administration, and again under the Grenville ministry of 1806. In 1812 he retired from public life to Ammondell, in W. Lothian, where he died on 8th October, 1817.

Erskine, John, Baron of Dun, a Scottish theologian, born near Montrose in 1508 or 1509. He was educated at Aberdeen University, and was the first to encourage the study of Greek in Scotland. Buchanan called him 'a man of great learning.' He early embraced Protestantism, was both a preacher and soldier, and was one of the commission appointed in 1577 to arrange the scheme of Church government known as the *Second Book of Discipline*. E. died 21st March, 1591.

Erskine, John, of Carnock, afterwards of Cardross, son of a gentleman who had served under the Prince of Orange, was born in 1695, entered the Faculty of Advocates in 1719, acted as Professor of Scots Law at Edinburgh from 1737 to 1765, published his *Principles of the Law of Scotland* in 1754, and composed, but did not publish, his *Institutes* in retirement. He died 1st March, 1768, and the *Institutes* appeared in 1773. This work is a very accurate and comprehensive digest of the law of Scotland of the time. The learning in both the civil and the feudal law is adequate, and the arrangement of the whole subject is lucid. It has, accordingly, remained a standard institutional work for citation in the law courts, although on some important subjects, particularly on mercantile law, the book is very meagre, a fact perhaps explained by the dulness of Scotch trade during the 18th c., and the superior attractions which the Rebellion and its consequences gave to the subject of heritable title. On the other hand, E. has no philosophical insight into the most general principles of law. He too blindly follows the written and traditional authority and the reason which authority gives for itself. Deficient in analysis, he was also without conception of the historical method in the treatment of legal problems. These shortcomings do not lessen the great value of his work as a digest of positive law. The *Institutes* have passed through several editions. The *Principles* have been re-edited by Guthrie.

Erskine, Thomas, Lord, a younger brother of Harry E., was born 10th January, 1750, educated at the High School of Edinburgh, and at the grammar-school and University of St. Andrews. From 1764-68 he cruised about the W. Indies and S. America in H.M.S. *Tartar* under Sir David Lyndsay. He wished to enter the army, but could not find the money for a commission for some time. On his father's death E. became an ensign in the Royals or 1st Regiment of Foot, and married a good and beautiful wife, a daughter of Daniel Moore, Esq., M.P. for Marlow, in 1770. In 1772, his regiment having come to London, he made the acquaintance of Johnson, Burney, Reynolds, &c., at the house of Mrs. Montagu, and published *Observations on the Prevailing Abuses in the British Army arising from the Corruption of Civil Government*. On the suggestion of Lord Mansfield, he abandoned the army for the law in 1775, and after the usual course of study, was called at Lincoln's Inn, 3rd July, 1778. His first appearance was in defence of Captain Baillie, who was prosecuted for libel for having exposed the gross abuses in Greenwich Hospital. A striking speech led the way to immediate professional success. In 1779 he defended Admiral Keppel, who was tried by court-martial on a charge of incapacity in the battle off Ushant. In 1781 he appeared for Lord George Gordon, and startled the propriety of the court by swearing in the course of his speech. Returned to Parliament for Portsmouth in 1783, he and John Scott (afterwards Lord Eldon) both made their maiden speeches on Fox's India Bill. Next year occurred the famous case of the Dean of St. Asaph, who was tried for seditious libel, in republishing Sir W. Jones' little political tract, *A Dialogue between a Gentleman and a Farmer*. The case, as treated by Justice Buller, who nearly committed E. for contempt of court, rendered necessary Fox's Libel Bill, which made the jury judges of the law as well as the facts. From 1784 to 1790 E. was not in Parliament, but remained the private friend of Fox and Sheridan, and constantly rose in reputation at the bar. Perhaps the finest speech he ever delivered was in defence of Stockdale, who had published a pamphlet by Logan, a Scotch minister, upholding Warren Hastings against his impeachers. In 1790 Portsmouth again returned him to Parliament, which he did not leave till he was made a peer. The 'Reign of Terror' under Lord Loughborough's Chancellorship now began, and E. had a crowd of political clients, such as Paine, Frost, the *Morning Chronicle*, &c. The suspension of the Habeas Corpus Act in 1794, in consequence of the growth of societies formed to secure parliamentary reform, led to the great cases of Hardy and Tooke, which placed him at the summit of his popularity. About this time he published *A View of the Causes and Consequences of the Present War with France*, which ran through thirty-seven editions. Going to Paris with Fox in 1802, he was introduced to Napoleon and also to the French bar at the *Cour de Cassation*. On Pitt's death in 1806, E. was created Baron E., and appointed Lord Chancellor. He quitted public life at the close of his Chancellorship in 1807, after which he wrote a preface to Fox's speeches, several pamphlets on Greek questions, and a political romance called *Armata*. He died at his brother's house in Scotland, 17th November, 1823. E. was probably the most eloquent speaker which the English bar ever produced—a man of incomparable dexterity, firmness, and brilliant imagination. See Brougham's biography, prefixed to an edition of his speeches in 1847.

Erskine, Thomas, of Linlathen, born 13th October, 1788, was the grandson of John E. of Carnock, and nephew of the Evangelical leader the Rev. John E. He was called to the Scotch bar, but did not practise. His life, which was private but not retired, was spent chiefly at Linlathen and Edinburgh, with occasional visits to Paris and Geneva. He died in March, 1870. E.'s first literary effort was assisting in the Scotch editions of the works of Richard Baxter and John Gambold (1822). In his *Remarks on the Internal Evidence of Revealed Religion* he represents the incarnation as something contrived to produce a certain vivid effect, not otherwise producible, on the human mind, viz., a perception of God's infinite love. From this follows salvation, or the conscious habitual surrender of the human will to the divine. His *Unconditional Freeness of the Gospel*, a book warmly praised by Dr. Chalmers, is still much read. He insists on the universality of the offer of pardon through Christ, which on the stricter Calvinistic view is inconsistent with election. Hence in his *Doctrine of Sacrifice*, he represents that the quickening Spirit of God has passed into every corrupt soul of man, and that there is a real freedom, or power of choice, to follow or to resist its suggestions. E.'s latest meditations are contained in a posthumous volume, *The Spiritual Order*, and his life was written by the late Principal Shairp. What attracted men towards E. was his earnest simplicity of religious faith. He formed a link between Scotland and the finer minds in the English Church. See Hanna's *Letters of T. E.* (Edinb. 1877).

Eryn'go, or **Eryn'gium**, a genus of Exogenous plants belonging to the esculent or harmless section of the *Umbelliferæ* (q.v.). The field E., found in England and Ireland, furnishes 'E. root,' formerly used as a tonic. The sea-E. or holly is common on coast-lines, and its root is believed to possess tonic properties, alluded to by Falstaff. This root, as a sweetened preparation, is esteemed as an aperient and diuretic. Other species are the water E. and the fœtid E. of the New World. These plants have stiff spinous leaves, capitate sessile flowers, and a large prickly involucre, with an obovate scaly fruit.

Erys'imum, a genus of Cruciferous plants, represented by the 'worm-seed,' found in Europe and N. America. The popular name is derived from a former use of the seeds as a remedy for internal parasites. This plant has a four-sided 'pod' or fruit, is an annual, and attains a height of 16 or 18 inches. The leaves are small and lance-shaped, and the flowers yellow. The perfoliated E., grown in Japan, affords a fixed oil from its seeds.

Erysip'elas, a febrile and inflammatory disease, associated with an Exanthematous Eruption, which has a tendency to spread, and may involve the areolar tissue beneath. In England E. is sometimes called *St. Anthony's Fire*, and in Scotland *Rose*. E. is not a disease of the skin, but the pathological phenomena resulting from the action of the poison on the skin are that the skin is diffusely inflamed, being either of a bright scarlet or rose-coloured tint, disappearing on pressure, but reappearing when the pressure is removed. The areolar tissue is generally involved. The face, head, and neck are the parts most frequently affected, but a considerable portion of the trunk, or one or both lower or upper extremities, may be involved. E. may terminate by desquamation, vesication, suppuration, or gangrene. The symptoms of E. are fever, muscular pain, quick pulse, white tongue, nausea, sore throat, &c. On the third day the fever is continuous, the tongue brown and dry, and there is pain, swelling, and tenderness of lymphatic glands of the neck, and the cutaneous inflammation appears. From the fifth to the eighth day the bright colour begins to disappear, and desquamation takes place. E. has a tendency to spread, and sometimes it is erratic. The head, face, and limbs are sometimes enormously swollen, the inflammation extending deeply into the subcutaneous tissue, followed by suppuration (*E. phlegmonodes*) or by gangrene (*E. gangrenosum*). Cause—some specific poison. Propagation—E. is a communicable disease. It has been affirmed and denied that it is contagious and infectious, but it certainly spreads by *fomites*. An attack of E. does not secure immunity, but rather predisposes. E. in the surgical wards of a hospital is a most dangerous disease. Destructive epidemics of E. have occurred both in Europe and America. Treatment—in mild cases, rest, saline laxatives, cooling drinks and low diet, diaphoretics, and opiates occasionally. Tincture of the perchloride of iron in bitter infusions was at one time considered a specific. Sulphites of sodium or potassium have been recommended for both internal and external use. Dry flour, or starch flour, dusted over the inflamed part is a soothing application, but the advantage of attempting to limit the spread of E. by caustics or tincture of iodine is very doubtful.

Erythe'ma (Gr. *eruthēma*, 'redness') is a disease entirely distinct from erysipelas, the only symptom in common being that of redness of the skin. E. expresses inflammatory redness of the skin occurring in one or several patches of irregular form without pimples, vesicles, or pustules, and is produced by simple congestion of the cutaneous vessels. There is but slight swelling, except where there is serous effusion into the tissues of the skin. Acute E. terminates by subsidence of the redness and desquamation; chronic E. results in greater changes, and may terminate in psoriasis. E. is non-contagious, is occasionally produced by local irritation, but is generally symptomatic of constitutional or visceral disorder. The principles of treatment are to restore the functions of the system to healthy action, and to allay the local irritation by evaporating lotions, water dressings, warm fomentations, and ointments of various kinds.

Erythro'nium, a genus of Liliaceous (Endogenous) plants, represented by the 'dog-tooth violet,' so named from the appearance of its little white-coloured bulbs. This plant grows in our gardens, and has drooping flowers. It is a native of Central Europe, and also occurs in Siberia.

Erythrophlæ'um, a genus of Exogens belonging to the *Leguminosæ*, and to the *Mimoseæ*, a gum-arabic section of that natural order. Of this genus the E. of Guinea is a familiar species. It is a tree, attaining the height of 100 feet or more. Its red juice is used in ordeal by the native priests to test the innocence of an accused person.

Erythroxyla'ceæ, a natural order of Exogenous plants, distinguished by the flowers springing from overlapping scales. No calycine glands are developed, and plaited scales exist at the base of the petals. The ovules are anatropal, and possess no funiculi, or cords of attachment. *Erythroxylon coca* of Peru has long been famed for its supposed powers of sustaining the strength. It is the *ipadu* of the Indians; and Spruce remarks that with some ipadu-leaves in his mouth an Indian will walk for two or three days without food and without any desire to sleep. The leaves act by stimulating the nervous system. The corky E. of Brazil furnishes a brown dye from its bark.

Erzerum', **Erzeroum**, or **Erzrum** (*Arsen-er-Rum*, 'the land of the Romans,' from being founded under the Eastern Roman Empire; Armen. *Karin* or *Garin Khalakh*), a fortified city and the capital of the vilayet of the same name and of Turkish Armenia, on the river Kara-gu, a branch of the Euphrates, 125 miles S.E. of Trebizond, and 6000 feet above the level of the sea. It is the seat of an Armenian archbishop, and has a strong citadel, some forty mosques, several Armenian and Greek churches, and many bazaars and baths. The best buildings are of volcanic stone and sun-dried bricks, and the streets are narrow and filthy. E. is the entrepôt of a great caravan trade between Persia, Georgia, and the chief commercial cities of Asia Minor, chiefly in European manufactures, and in Eastern silks, shawls, cotton, tobacco, rice, and indigo. The principal manufactures of E. are morocco leather, sheepskin pelisses, and iron and copper wares. A fortress was founded here, near the Syro-Armenian town of Arsen, and named Theodosiopolis, after Theodosius II., in A.D. 415. On the destruction of Arsen the inhabitants removed hither, and transferred the present name to their new abode. E. was pillaged in 1201 by the Seljuks, who destroyed, it is said, some 100 churches. It was taken by the Mongols in 1242, by the Turks in 1517, and by the Russians in 1829, but was restored to the Porte on the peace of Adrianople. A great part of it was destroyed by an earthquake in 1859. In the last war between Turkey and Russia (1877-78) E. was besieged by the Russians and, as one of the conditions of the armistice at the end of the campaign, it was occupied by them for a time and then given back to the Turks. Pop. of town 59,050; of vilayet 645,702.

Erz'gebirge (*i.e.*, 'metal mountain'), a mountain chain of Germany forming the boundary between Saxony and Bohemia and stretching from the Elbe valley in the N.E. to the Thüringerwald in the S.W., a distance of 120 miles. It reaches a height of 3804 feet in the Keilberg, and has an abrupt declivity on the S.E. side, where several affluents of the Elbe have their rise. The E., which is of granite formation, is rich in silver, tin, iron, cobalt, &c. To the S. of this range, at an altitude of 3162 feet, is Gottesgabe ('the gift of God'), the highest town in Germany.

E'sau. The story of E.'s life is given in Gen. xxv.-xxxvi. Some modern critics, however, are of opinion that the patriarchal history has come down to us in a legendary form, and suggest that the name E. [of which two different explanations are given in Genesis (xxv. 25, and v. 30)] refers to the appearance of the country (Edom), in which red earth and rocks prevail, and of Mount Seir ('rough,' 'bristly,' *i.e.*, wooded). The higher antiquity of the Edomites (cf. Gen. xxxvi. 31), their friendship with the Israelites till the time of Saul, their conquest by David, the greater fruitfulness of Canaan as compared with Mount Seir, itself not unfruitful in parts, are thus supposed to be embodied in the story, in which E., the elder of two twin brothers, is supplanted by the younger, Jacob (Israel), who gets the blessing of the fatness of the earth, and himself gets an inferior blessing.

Escalade' (Ital. *scalata*, from Lat. *scala*, 'a ladder') is scaling a fortification by means of ladders. The ladders used consist of several pieces about twelve feet long, fitted together by sockets. The advance party of an E. is called the 'forlorn hope,' and though in their approach they are covered by the heavy firing of their comrades in the rear, the dangers to which they expose themselves are vastly greater than those to be met with in any other part of the field.

Escall'op, or **Escallop-Shell,** in heraldry, an indented shell; a badge belonging to noble pilgrims; the emblem of the apostle St. James the Greater.

Escape'ment, the mechanical arrangement in watches and timepieces by which the circular motion of the wheels is converted into the oscillatory motion of the balance-wheel or pendulum. See HOROLOGY.

Escarp' (from Ital. *scarpa*), in fortification, is the side of the ditch next the fort, while the side of the ditch next the country is the counterscarp. The E. is usually *revetted* (faced) with masonry or wood.

Escarp'ment, the geological name of a steep or abrupt cliff formed by the outcrop of inclined beds.

Escaut, the French name of the river Scheldt (q.v.).

Esch'ar (Gr. *eschara*), a slough of disorganized tissue occasioned by burns or the application of caustics.

Escheat' (*eschet* from Fr. *échoir*, 'to happen') is a term of feudal law denoting the incident by which lands or tenements revert to the sovereign or lord of the fee as the original grantor, on account of want of heir, or from forfeiture. Escheats are of two kinds—(1) Those forfeitures which belong to the sovereign from his prerogative when there is no heir to succeed to the inheritance; (2) those which belong to every lord of the manor, in virtue of his seigniory, under a royal grant. The law of E. presumes, upon the feudal system, that the blood of the person last seised in Fee Simple (q.v.) is extinct, either actually, or from the fact of the deceased tenant having been a bastard and died intestate, or (formerly) when the tenant was convicted of treason or felony, from which it follows that what the feudal writers call *feodum apertum* must revert to the lord of the fee. The Escheat Procedure Act of 1887 provides for inquiry as to the title of the Crown in any case where under the older statutes 'escheators' would have been employed.

In Scotch law single E. is the forfeiture to the Crown of one's moveable estate on conviction of certain crimes. Formerly it followed denunciation for non-payment or non-performance of a civil debt or obligation. Liferent E. is the forfeiture to the superior of the annual profits of the vassal's lands. A total forfeiture to the Crown of one's property is in Scotland a penalty attached to high treason only. Single E. is a penalty attached to a sentence of outlawry, fugitation, and other crimes. It ensues on sentence for a capital crime in Scotland.

Eschelles', Les, or **Échelles, Les** (Fr. 'the ladders'), a village in the S.E. of France, in the department of Savoie, about 11 miles S.W. of Chambéry. In the road between Chambéry and E. lies a huge limestone cliff 800 feet high, which travellers were formerly obliged to cross by means of ladders, but which was pierced by a tunnel 1000 feet long and 25 in height and width, a work begun by Napoleon and completed by the King of Sardinia in 1817. Pop. of commune 748.

Esch'enbach, Wolfram von, a celebrated Minnesinger, was born at Eschenbach, near Ansbach, in the latter part of the 12th c. He belonged to a noble family, and spent his life in knightly pursuits. He was conspicuous among the minstrels competing in the *Wartburg Krieg* ('war of the Wartburg'), held at the court of Hermann, Landgraf of Thuringia, in 1207. After Hermann's death E. retired to his paternal castle. He died about 1220. In his own time (says Schlegel) E. was as celebrated as Dante. His poems, which are on chivalrous and allegorical themes, display great imagination and elegance of diction, and combine the tenderness of the *Minne-lieder* with the brilliant fancies of the Provençal lyrists. His best works are *Parzival*, *Titurel*, *Lohengrin*, and *Willehalm*, a legendary Prince of Orange, who figures in the romance of Charlemagne.

Esch'er, Heinrich, merchant, was born at Zürich in 1626, and was sent to Louis XIV. in 1663 to renew the peace, and to ask for a renewal of Swiss trading privileges in France. He died 21st April, 1710.—**Johann Gaspard E.,** another Zürich man, was born 15th February, 1678, educated as a lawyer; supported in the Great Council the cause of public education and religious toleration, and was also successful diplomatically with Cardinal Fleury. He died 23rd December, 1762.—**Hans Konrad E.** was born at Zürich, 24th August, 1767. For his chief work, the embankment of the Linth and Glatz, he got the singular reward of adding *Von der Linth* to his name. Hans died 9th March, 1823. His son, **Arnold E., Von der Linth** (born 8th June, 1807, died at Zürich, 12th July, 1872), won a high reputation as a geologist.—**Johann Heinrich Alfred E.,** born at Zürich, 20th February, 1819, and educated for the law at Berlin, Bonn, and Paris. After lecturing at home on Swiss federal law, he was in 1841 elected to the Great Council, of which he rapidly became Secretary and President. He joined Furrer in expelling the Jesuits (1845), and devoted much thought to the reorganization of the cantonal schools. In 1848, as member of the Diet, E. intervened between Austria and Ticino, who were about to fight. He entirely approved of the federal constitution and the increased centralization. In the Bundesrath or Federal Council (see SWITZERLAND), which is an essential part of the Bundestaat Constitution (adopted by plebiscite in 1874), E. had much to do in forming the liberal and efficient system of education which Switzerland enjoys.

Eschscholt'zia, a genus of Exogenous plants belonging to the *Papaveraceæ*, or Poppy order. The Californian E., an annual common in our gardens, has large orange flowers. The floral receptacle grows up around the base of the ovary and carries up along with it the stamens, calyx, and corolla, the calyx ultimately separating from the other parts, and resembling a candle-extinguisher in shape.

Esch'wege ('Ash-tree road'), a town in the province of Hessen-Nassau, Prussia, 28 miles S.E. of Cassel, on the Werra. E. has an old castle, two churches, a *real*-school, and a pro-gymnasium. It is famous for its industries—cloth, oil, soap, and glue-making—and has tobacco manufactories and breweries. It is sometimes called the 'Hessian Elberfeld.' Pop. town 9016; district 42,260.

Esch'weiler ('Ash-tree dwelling'), an important manufacturing town in the province of Rheinland, Prussia, on the Inde, 9 miles E.N.E. of Aachen. The principal industries are the manufacture of iron and tin ware, machines, needles, iron-wire, silks, ribbons, leather, and wax-cloth. E. has besides breweries, rolling-mills, copper-forges, and lead and coal-mines. Some of the coal-mines are 200 fathoms deep. Tin and silver are also found. Pop. 16,780.

Esco'rial (Sp. *escoria*, 'dross,' in reference to the slag of exhausted mines found here) is a small town in the province, and 26 miles N.W. of the city, of Madrid, on the lower slope of the Sierra de Guadarrama. The town has sprung up beside the famous building—monastery and royal residence in one—of El E., which owes its origin to a vow made by Philip II. of Spain to commemorate St. Lawrence in gratitude for the victory he had won at St. Quentin on that saint's day (10th August), 1557. St. Lawrence is said to have been roasted alive on a gridiron, and Philip's votive memorial was built in the form of that utensil. It cost five million ducats, is built of bluish granite, and though grotesque and *bizarre* in style, is lavishly decorated, and contains several valuable collections of books and Arabic MSS., of coins, and of frescoes and pictures by Giordano, Carduchi, Pellegrini, and other Italian masters. The crucifix in the oratory is enriched with diamonds, &c. The mortuary chapel (called the Pantheon) contains the remains of the Spanish kings from Karl I. (V.) to Ferdinand VII., with the exception of Ferdinand VI., who was buried at Madrid.

Es′cuage (Old Fr. *escut*, 'a shield,' from Lat. *scutum*), in English feudal law, meant service of the shield, a kind of service by which the tenant was bound to follow his lord to war at his own charge. It also denoted money payments in place of military service.

Es′culin, an alkaloid obtained from the capsules of the fruit of the horse-chestnut. E. is slightly bitter, almost insoluble in cold water, soluble in 12 parts of boiling water, and more soluble in alcohol. E. has been introduced in Lyon for the cure of ague and periodic neuralgia, in place of quinine. Dose, 15 grains twice a day. The bark was used for the same purpose in 1720, and during the wars of the French Republic, when the importation of cinchona was interrupted.

Escutch′eon (Old Fr. *escusson*, Span. and Port. *escudo*, Ital. *scudo*, Lat. *scutum*, 'shield') is the shield upon which arms are depicted, but the word is also used to express the whole coat of arms. *E. of Pretence* is an inner shield bearing the arms of a wife who has brought lands as dowry.

Esdrae′lon is the Greek form of the Hebrew Jezreel, occurring only twice in the Apocryphal Book of Judith, iii. 9 and iv. 6. In Judith i. 8 the form is Esdrelom, and in chap. vii. 3, Esdraelom. The Plain of E. is triangular in shape, the mountains of Gilboa on the E. forming the base, the mountains of Galilee on the N. the one side, and Mount Carmel on the S.W. the other. Owing to its natural features it has been from time immemorial the battlefield of Syria, and from its position between Asia Minor and Egypt almost the battlefield of the East. It was the scene of the battle between Barak and Jabin (Judges iv.), Gideon and the Midianites and Amalekites (Judges vi., vii.), Saul and the Philistines (1 Sam. xxix. 1.), Ahad and Benhadad (1 Kings xx.), and between Josiah and the Egyptians (2 Kings xxiii., where it is called Megiddo, from the town of that name which stood on its southern border). Here the Assyrians and Persians, the Crusaders and Saracens, the Egyptians and Turks, the Arabs and Franks have fought, and here Bonaparte gained one of his victories.

Es′dras is the name of two Apocryphal books originally written in Greek, and attributed to Ezra (Gr. *Esdras*). In the Vulgate they are called 3rd and 4th E., 1st and 2nd E. being the canonical books of Ezra and Nehemiah. This arrangement was followed in all the earlier editions of the English Bible; that now existing, of calling the Apocryphal books 1st and 2nd E., was first adopted in the Geneva Bible. 1. E. consists of (1) the two last chapters of 2 Chron. nearly verbatim; (2) an original portion, written, probably in Egypt, in imitation of Esther and Daniel, and giving the history of three young men at the court of Darius; (3) the Book of Ezra differently arranged; and (4) a portion of Nehemiah. 2. E., or the Revelation of E., the date of which has been fixed variously from 28 B.C. to 69 A.D., and which was also probably written in Egypt, consists, as in English, of (1) two passages (cc. i., ii., and xv., xvi.) not found in the Ar. and Eth. versions, but interpolated in the Lat. text; (2) a passage after vii. 35, found in the Ar. and Eth. and omitted in the Lat. (probably from its denying the efficacy of human intercession after death); and (3) the original Apocalypse, consisting of a series of three revelations and three visions to Ezra, followed by the appearance to him of the Lord, from whom he receives the law.

Esenbeck′ia, a genus of plants belonging to the *Rutaceæ* or Rue order, and represented by the fever-curing E., which is employed in Brazil as a substitute for Peruvian bark.

Esk (Cymric, *wysk*, Gael. *uisk*, 'water'), the name of several streams in Scotland, of which five are worthy of note:—1. The Dumfriesshire E., rising on the borders of Selkirk, near Ettrick Pen, and flowing in its upper course through the wild pastoral solitudes of Eskdalemuir, and in its lower course through the richer scenery of Cumberland, falling into the Solway at the head of the estuary after a southerly course of 45 miles. This is the river of Young Lochinvar. 'He swam the E. river where ford there was none.' 2 and 3. The N. and S.E. in Midlothian, which rise in Peeblesshire and flow N.N.E., uniting in Dalkeith Park, and entering the Firth of Forth at Musselburgh after a course of 23 miles. The N. branch passes through the romantic ravines of Roslin and Hawthornden. 4 and 5. The Forfarshire Esks, both of which have their source in the eastern Grampians, the more northerly and lesser of the two reaching the sea 4 miles N. of Montrose after a course of 25 miles; the southerly and larger stream crossing the valley of Strathmore, passing Brechin, and falling into the Bay of Montrose after an easterly course of 40 miles. The southern English form of this Celtic word is *Exe* or *Axe* (q.v.).

Es′ki-Djuma ('Old commune'), a town in Bulgaria, 18 miles W. by S. of Shumla, near the Kamchik springs, has a culture of silk and large fairs. Pop. 9680.

Eskimo or **Esquimaux Dog,** a variety of Dog (q.v.), so named from its being found associated with the Eskimo or Esquimaux and other northern tribes in Europe, N. America, and Asia. It is extensively used in Arctic travelling for drawing sledges, and is very hardy and sagacious. The general colour is a dark grey, and the average size about that of a pointer. The outer hair is coarse and stiff, but a warm softer inner coat exists. The ears are short and pointed, and the bushy tail is generally curled over the back.

Eskimo Dog.

Es′kimos or **Esquimaux** (native name, *Inuit*, 'the people'), called by the Abenaki—an aboriginal people who at one time inhabited the country afterwards known as New England — *Eskimantsic*, or 'eaters of raw flesh.' The Abenaki applied this name to the tribes on the coasts of Labrador; the early French Canadians converted it into *Eskimaux* or *Esquimaux*. Latham and other ethnologists write it *Eskimos*, after the Danish orthography; while Rink, following the same orthography, uses the name *Eskimo* both in a singular and in a plural sense. The E. are a distinctive and singular people inhabiting Greenland and Labrador, the N. American shores, the inhabited islands of the N. American Archipelago, and part of the coast regions of the extreme N.E. of Siberia. They are spread over an insular region and a coast-line 5000 miles in extent, but they never penetrate inland. They are essentially a littoral people, able to obtain sustenance only from the sea. The E. closely resemble each other over the whole area occupied by them in appearance, language, habits, traditions, &c., and there is perhaps no other nation so unmixed in blood. Their faces are of a broad oval shape, the forehead and chin recede, the nose is usually broad and depressed, but in some instances prominent like that of Europeans. The eyes are small and oblique, and the complexion is nearly white after the removal of the permanent coating of oil, dirt, and smoke which covers the face. The usual height is from 5 feet to 5 feet 10 inches, and in rare instances to about 6 feet, and both men and women are remarkably muscular and agile. Latham ranks them among the American Mongolidæ, under which designation he includes all the native races of the New World. Rink, probably the most authoritative writer on the origin and history of the E., asserts that the independent existence of this people dates from a very remote period—many of their traditions being much more than one thousand years old—and inclines to the belief that the immediate cradle of the race was the American and not the Asiatic continent. His theory is that this people, originally located on the great rivers of polar N. America, were driven northward to the coast and to the islands beyond by Indians from the south, between whom and the E. a traditional enmity subsists to the present day. The E. depend for their existence on the seals and cetaceous animals which they capture at breathing-holes in the ice or at its edge. The blubber of these animals is their usual food, and enables them to resist the extreme cold of the regions they inhabit, while the skins of the seal, &c., are made into suitable and sufficient clothing. The imperative necessity of capturing these animals in order to preserve life has moulded the character of the social life, defined the nature of the inventions, and affected if not created, the religion, the superstitions, and the amusements of this people. Their *kayak* or shuttle-shaped boat, in which they hunt the walrus and whale, is a framework of wood joined together chiefly by strings, covered with skins, and impenetrable to water. Nothing could be more admirably adapted for its purpose, yet it would be difficult to find any sea-going boat anything at all like it in any other part of the globe. Their harpoons are fitted with an inflated bladder, which serves the double purpose of retarding the retreat of the wounded animal and floating the harpoon should it escape. The points of the harpoons and spears are so fitted into the shafts that after the blow has been delivered the point and the shaft come apart. The shafts of these weapons in most cases consist of small pieces of bone neatly tied together with thongs, and the points are supplied by the unicorn of the narwhal, by sharp-pointed bones, teeth, and occasionally metal, of the value of which the E. have the liveliest appreciation. The dog-sledges, marvels of construction, are also, for the most part, formed of pieces of bone tied together. Grouped together in small tribes of six to twelve or more families, the E. regard their wintering quarters as their home; in summer, however, they are constantly travelling, and choose their route usually with the view of hunting reindeer, though seal-hunting, fishing, and trade are objects always kept in mind. When the cold weather comes round, the party returns to the wintering-place, and recommences sealing and whaling for the season. They often eat flesh and fish raw, but the usual custom is to boil it in a stone pot suspended over a lamp fed with blubber, and with moss for wicks. The costume is nearly the same for both sexes, consisting of fur or sealskin jacket, with hood, trousers of the same material, and boots reaching well up the thigh. In summer they reside in tents formed of hides sewn together, but in winter they retire into houses variously constructed, as the capabilities of the locality permit—of stones and turf, stones and bones, drift-wood, or blocks of frozen snow so cut and arranged the one above the other as to form a vault or dome. Owing to the uncleanly habits of the people, and to the circumstance that their food is often in a putrid condition, the stench of these houses is unsupportable to white men, though some of our early explorers passed whole nights in them. The religion of the E. is a form of paganism, the system embracing a supreme being named *Tornarsuk*, a series of guardian spirits named *tornat*, and a class of human beings (*angakut*) endowed with supernatural wisdom or power. Existence the E. accept as a fact without speculating on the origin of man. Their invisible world embraces the *upper world*, the unlucky souls in which suffer from constant cold and famine; and the *under world*, in which the temperature is warm, and the food abundant. The E. are firm believers in witchcraft of a most complicated description. The tales and traditions of this singular people are divided into two classes, the ancient and the modern, the former of which—recounting extraordinary adventures, under conditions, however, precisely the same as those under which the E. of the present day live—are believed to be much more than a thousand years old. These tales form a body of unwritten literature, handed down orally, but with scrupulous exactness, from generation to generation. Story-telling is cultivated as a science, and the art of the *raconteur* is subjected to such a severe standard in the matter of accuracy, that the tales are supposed to have been preserved in an unaltered shape for ages. They concern themselves chiefly with deeds of violence terribly avenged, and the usual moral enforced is to be kind to orphans and to the defenceless, if we would avoid the surely coming day of reckoning. Of the entire race, the number of which is not ascertained, those that have come directly under European influence are chiefly the inhabitants of the Danish districts in Greenland. During the last century these were rapidly decreasing; but after the Moravian mission established here by Hans Egede in 1721 had taken firm root, the decrease was arrested, and in time the numbers began to increase. For some time subsequent to 1855 the numbers of E. in the Danish districts remained almost stationary between 9400 and 9700; but the pop. of Greenland is now estimated to amount to 10,516, which number includes a few Europeans. The Danish officials have never introduced intoxicating liquors into Greenland, and scarcely another instance can be adduced in which Europeans have shown equal consideration for an aboriginal race. See Richardson's *Polar Regions*, and Henry Rink's *Tales and Traditions of the Eskimo.*

Eskimo Hunter.

Es'ki-Zaghra, a town in Eastern Roumelia, about 30 miles S. of the Balkan Mountains, and 67 miles N.W. of Adrianople, with manufactures of carpets, &c., has several mosques and Christian churches, and a huge bazaar. Its baths are much frequented. Pop. 15,027.

Es'la, a tributary of the Douro, rises in the Cantabrian mountains, province of Leon, Spain, and after a S.W. course of 130 miles, falls into the Douro, 15 miles below Zamora. In the angle at the confluence of the Douro and E. is found the finest clay in the Peninsula for the manufacture of earthenware.

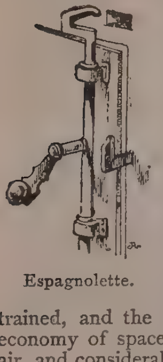
Esmerel′da (Span. 'emerald'), a river of Ecuador, S. America, rises near Quito, passes the town Esmerelda (pop. 1560), and enters the Pacific after a course of 110 miles.—E. is also the name of a mountain range of Brazil, province of Minas Geraes, about 170 miles long, and of a county in Nevada bordering on California, and rich in minerals.

Es′neh, or **Es′ne,** a town in Upper Egypt, on the left bank of the Nile, about 80 miles N. of Assouan. It has some manufactures of cotton and earthenware, and a pop. of 3250, of whom half are Copts. At E. are the ruins of a sandstone temple, founded by Thothmes III., and dedicated to Chnumis Satis and Har-Hek.

Part of the Temple at Esneh.

Eso′cidæ, a family of Teleostean fishes, represented by the Pikes. It belongs to the *Malacopteri* ('soft-finned') section of the Teleostei, and to the Abdominalian section of the *Malacopteri*. The dorsal fin is placed far back on the body, and the intermaxillary bones partly contribute to the formation of the upper jaw.

Esoter′ic (Gr. *esōterikos*, 'inner'), in the ancient mysteries and schools of philosophy, was applied to the doctrines taught in private, and designed for the initiated alone. Those taught to the public were termed *exoteric*. In general the former denotes the secret or abstruse, the latter the public or popular.



Espagnolette.

Espagnolette, in architecture, a French term signifying an arrangement by which a window is closed. It consists of an iron rod, with a hook at each end, which is moved by a handle inside the room. The hooks are held fast in staples when the window is closed. By turning the handle, the hooks are released from the staples, and the window opens.

Espal′ier (Fr. from Ital. *spalliere*), a supporting lattice-work of wood or wire-fencing on which fruit-trees, &c., are trained, and the objects gained by the use of which are economy of space, favourable exposure to heat, light, and air, and considerable protection against the effects of high winds. The British fruit-trees most suitable for training by means of the E. are the apple and pear.

Esparte′ro, Don Jo′aquin Baldome′ro, a Spanish general and politician, the son of a cartwright, was born at Granotula, La Mancha, 27th February, 1792. He was intended for the Church, but, on the French invading Spain, in 1808, joined the *Batallon Sagrado* ('the sacred battalion') formed wholly of students, and, on the expulsion of the French, fought in S. America against the insurgent colonies. On his return to Spain he espoused the cause of Isabella II., drove Don Carlos from the country in 1839, for which he was made a grandee and duke, and from 1841 to 1843 governed as regent with considerable success, though often foiled by intrigues. In 1843 the party of progress and the party of Queen Christina united against him. General Narvaez entered Madrid, and E., deserted by his troops, betook himself to England, where he remained until 1848. He lived in retirement in Spain from 1848 to 1854, when Queen Isabella unwillingly summoned him to form a ministry along with General O'Donnell. Soon two parties arose—the Liberals, followers of E., and the opponents of progress, headed by O'Donnell—the antagonism between which became so bitter as to completely cramp the government. In 1856 E. was dismissed, and immediately rebellions in his favour broke out at Madrid, Barcelona, and Zaragoza, but from these he held aloof, resigning the senatorial rank in 1857. In 1868 he showed warm sympathy for the provisional government, and in 1869 it was proposed by one of the deputies that he should be made king, a scheme which the Cortes did not favour. In 1875 he avowed his adherence to Alfonso XII. He died at Logroño, 9th January, 1879. E. proved himself a good soldier, and one of the most honest, patriotic, and disinterested of Spanish politicians, but wanted the decision, wariness, and dexterity indispensable to successful Spanish statesmen.

Espar′to (*Macrochloa*, or *Stipa*, *tenacissima*), a well-known genus of Grasses, grown in large quantities in Spain and Northern Africa, whence it is exported for the manufacture of mats, baskets, ropes, paper, &c.

Es′pinasse, or **Lespinasse, Claire Françoise,** famous for her powers of fascination, intellectual brilliance, and shifting fervours of sentiment, was born at Lyon in 1731 or 1733. She was the child of Madame d'Albon, and after acting as governess in a noble's household, went to Paris as a companion to Madame du Deffand, to whom she was at first strongly attached, but whom she soon eclipsed by her youthful beauty and wit. A quarrel ensued, and Mademoiselle E. separated from Madame du Deffand, most of whose admirers, D'Alembert among others, forsook her for her more captivating rival. Her friends then obtained Mademoiselle E. a pension from the king, and she continued until her death, at Paris, 23rd May, 1776, to charm the most cultivated circles of her time. D'Alembert was deeply enamoured of her. Her letters show her to have possessed a warm heart, as well as dazzling wit and exquisite accomplishments. See her *Lettres* (Par. 1806).

Es′pinel, Vicente, a Spanish poet, born at Ronda, in Grenada, 28th December, 1551. He studied at Salamanca, entered the army, fought in Flanders, and travelled through France, Italy, and Spain. He afterwards took holy orders, obtained some preferment, and ended his life in a monastery at Madrid in 1634. E. was a musician of considerable fame, and added the fifth string to the guitar. He probably invented the stanza of ten octosyllabic verses called *Espinelas*. His works are *Life and Adventures of Marcos of Obregon*, which somewhat resembles *Gil Blas*; *Casa de las Memorias*, a poem; a translation of Horace's *Ars Poetica*, and various lyrics and biographies.

Espinha′ço, Serra do, a mountain chain in Brazil, running parallel to the coast, generally about 150 miles from it, though its offsets in places approach within 20 miles of it. It rises N. of Ouro Preto, and extends northward to the banks of the San Francisco. Its southern portion is the highest, but no summit rises above 6000 feet.

Espir'ito San'to (Port. 'Holy Spirit').—1. A maritime province of Brazil to the N. of Rio Janeiro, has an area of 17,315 sq. miles, and a pop. of 124,361. It consists of the land which lies between the mountains, Serra dos Aimores, and the sea, and between the river Mucury on the N. and the river Itabapuana on the S. It is watered by the Rio Doce, and is in great part covered with forests, in which are found valuable woods and drugs. The coast flats yield sugar, cotton, manioc, and rice. The capital is Victoria. 2. A town (called by the Spaniards *Sancti Spiritu*) of Cuba, near the centre of the island, 240 miles E.S.E. of Habana. Pop. 32,608. 3. The largest island of the New Hebrides, 65 miles by 20, and rising some 2000 feet above the sea.

Es'planade (Fr. from Lat. *ex* 'out,' and *planus*, 'flat'), in fortification, is an open space of ground extending in front of the glacis of a fortified work, such as intervenes between the citadel and the houses of every fortified town, and the object of which is to make certain that in the event of siege no cover shall be afforded to the enemy. The term is also applied to open spaces for walks and drives, into which the fortified works of former days are now so frequently converted.

Es'py, James P., an American meteorologist, was born in Pennsylvania about 1785. In his early life he was a successful teacher in Philadelphia, but becoming devoted to the study of meteorology, he left the profession of teaching and supported himself by lecturing, for which the United States present peculiar facilities. He delivered a series of lectures to the Franklin Institute of Pennsylvania, and rendered himself famous by his theory of storms. He received the Magellanic premium of the American Philosophical Society of Philadelphia in 1836 for a treatise on storms. His numerous lectures on this subject gained him the name of the Storm-king. In 1841 he published his book upon the *Philosophy of Storms*, a work which received the highest commendation. In the Smithsonian Institution at Washington he made his important experiments upon the cooling of gases, and the cooling effects of expansion on dry and moist air. E. made several able reports on meteorology to the United States Government, the last being printed in 1857. His ardour and enthusiasm did much to advance this science to the prominent place it holds in America. E. died in Cincinnati, 24th January, 1860.

Esquire', or Écuyer (Old F. *escuyer*, 'a shield-bearer,' from *escut*, Lat. *scutum*, 'a shield'), literally a man who carries a knight's shield. The E. in chivalry was the stage into which the page, *damoiseau* or varlet, passed at the age of fourteen. The next seven years were spent in athletics, running at the ring, tilting, and mock combats, and in attendance on a particular knight. On entering the temple of honour the E. became a knight or chevalier. E. was the first degree of 'grand chivalry,' to which, as a general rule, only persons of noble birth were admitted; but sometimes chevaliers were created without passing through the stage of E. The squire was responsible for the state of the knight's armour, a most important matter in close fighting with pointed weapons. The dress of an E. was properly a modest brown; but the garment of Chaucer's E. was 'embroidered like a meadow.' Many gentlemen of good birth did not become knights on account of poverty. (See CHIVALRY.) In English law E. is apparently a title not of dignity, but merely of *worship*, colonels, serjeants-at-law, and doctors of the learned professions being placed before esquires. There are five sorts of esquires, namely those by birth—the younger sons of peers and their eldest sons, the eldest sons of knights and their eldest sons; by prescription—heads or chiefs of ancient families; by creation or office—serjeants-at-arms, heralds, judges, officers of state, the higher naval and military commissioned officers, barristers-at-law, doctors of various faculties, justices of the peace; by appointment—a Knight of the Bath appoints three to wait upon him when he is installed or attends a coronation.

Esquirol, Jean Étienne Dominique, a French physician, famous for his treatment of the insane, was born at Toulouse, 4th January, 1772. He studied medicine in Paris, giving special attention to insanity, and in 1799 founded an institution for the mentally deranged. In 1811 he was elected successor to Pinel at the Salpêtrière, where he introduced an entirely novel treatment of maniacs, substituting kindness for constraint. He was made inspector-general of the university in 1823, and in 1826 chief physician to the Private Lunatic Asylum at Charenton. He died 12th December, 1840. Through his philanthropic labours and scientific attainments the old coercive and cruel treatment of the insane was abolished, and the present humane system introduced. E.'s chief work, *Des Maladies Mentales considérées sous les Rapports Médical, Hygiénique et Médico-légal* (Par. 1838), is of great value.

Esquiros, Henri Alphonse, a French author, was born at Paris in 1814. His first work, *Les Hirondelles*, appeared in 1834, and won the praise of Victor Hugo. He published *Les Magiciens*, a phantasy, three years later, and the romance of *Charlotte Corday* in 1840. In that year also he produced three works of great power—*Les Vierges Martyres*, *Les Vierges Folles*, and *Les Vierges Sages*. In 1841 E. was imprisoned in the Pélagie for supporting the views of Lamennais, when he wrote *Les Chants d'un Prisonnier*. In 1847 he published *L'Histoire des Montagnards*, and *Paris*, being papers on 19th c. life, reprinted from the *Revue des Deux Mondes*. E. became member of the Legislative Assembly in 1848; but after the *coup d'état* was exiled for his opposition to the Empire. In 1855 he came to England, and his *English at Home* was published at London in 1862 and 1863. His *Dutch at Home* was published by Chapman & Hall in 1861. In 1869 E. was returned to the *Corps Législatif*, and became prefect of a department. In 1870, however, he retired, and assumed the editorship of the *Égalité* at Marseille. He died at Paris, 13th May, 1876.

Ess'bouquet, an abbreviation of essence of bouquet, is a compound perfume of English origin and well established reputation. Like most bouquets, it is of complex composition, containing orange, citron, petit-grain, lavender, clove, and cassia oil, tincture of musk, and a minute quantity of attar of rose, besides other essences.

Ess'en, an ancient town of the province of Rheinland, Prussia, on the Börne, 20 miles N.E. of Düsseldorf by railway, in a district rich in coal and iron. It has a cathedral, the west choir of which dates from the 9th c., and which was renewed in 1855. The mines in the circle of E. produce about 20,000,000 tons of coal and 500,000 tons of iron ore annually. E. is the seat of the famous cast-steel works of Herr Krupp, which employ several thousand hands, and cover 1800 English acres, of which one-fifth is roofed over. The establishment is very complete, having 23 miles of rails for locomotives, and 9 miles for horse-waggons, a telegraph system, with stations, fire-brigade, hotel, beer-shops, bakery, printing-presses, &c. Pop. 78,706.

Essen, Hans, Henrik, Count, a celebrated general and statesman of Sweden, born in Kaflas, in Ostergotland, in 1755, and educated at the Sweden universities, he early attracted the notice of Gustavus III., whom he accompanied on his foreign travels. E. rendered valuable service during the campaign in Finland. On the assassination of the King, whom he had warned in vain of the impending danger, E. was appointed Governor of Stockholm by Gustavus IV., and later, in 1807, commander-in-chief in Pomerania, whence he was recalled. E. lived in retirement till 1814, when Charles XIII. sent him with an army against Norway, and on the union of the two countries he was made Governor of Norway. E. died 28th July, 1824.

Essences are solutions of volatile essential oils in alcohol, and are prepared—(1) by adding a rectified spirit to the odoriferous parts of the plant and distilling; (2) by adding the spirit to the previously-extracted oil and distilling; or (3) by adding the oil to the spirit and agitating till a uniform mixture is obtained. Innumerable simple and compound E. may thus be prepared. Alcoholic solutions, as of camphor, are sometimes called E. In the pharmacopœia E. and spirits are identical in preparation, but the former contain 1 part of the oil to 4 of the spirit, and the latter 1 to 49.

Essenes'. Countless derivations of the name have been given, making them 'the healers,' 'the holy,' 'the faithful to God,' 'the mysteriously silent,' 'the watchers,' 'the seers,' 'the agents,' 'the baptists,' 'the pious.' The greatest English authority, Ginsburg, who enumerates nineteen, prefers the last (Heb. *Chassiya*, 'pious'), which connects the name with *Chassidim*. The E. were a Jewish sect, or rather a branch of the sect of the Pharisees. They represented the direct and legitimate development of Judaism in a strict application of the demands of the law as understood from the time of Ezra. Being, like the Pharisees, the descendants of the Chassidim (q.v.) or Puritans, the E. were the ultra-Puritans, while the Pharisees were the moderate party; or the E. were to the Pharisees what the latter were to the general community. Thus in the Mishna, Talmud, and Midrashim, they are called the original Assideans, *i.e.*, Chassidim. If this be the correct theory of their origin, it is impossible to say at what date they could have been regarded as distinct from the general body of the Jews. They are first mentioned as a distinct sect in the time of Jonathan the Maccabæan, about 160 B.C. (Josephus, *Antiquities*, xiii. 5, 9). At first they lived in the general community, especially in Jerusalem, which had a gate named after them. From Jerusalem they retired to the smaller towns and villages, and from these to the deserts, in order to avoid the habitual wickedness of citizens, but also and chiefly because, according to their observance of the Levitical laws of purity, they considered themselves defiled by coming in contact with those who did not live according to the same rules. The majority settled on the N.W. shore of the Dead Sea, and the rest lived in scattered communities throughout Palestine and Syria. According to Josephus they numbered 4000. After A.D. 40 little is heard of them. Probably most of them became Christians. The most marked points of difference between them and the Pharisees were that they (1) formed an isolated brotherhood; (2) held celibacy to be a higher life; (3) did not go to the temple, nor offer sacrifices; and (4) did not believe in a resurrection of the body, though holding the immortality of the soul. Many of the precepts and practices of Essenism reappear in Christianity; but that the former led the way to the latter by expecting a Messiah and proclaiming the kingdom of heaven is incorrect, because the E. regarded these as enclosed within their own limits.

The principal doctrines and practices of the E. which appear in the Christian system are the following:—To seek first the kingdom of God and his righteousness (cf. Matt. vi. 33, Luke xii. 31); to seek to have no treasure upon earth, the supply of one's wants with contentment being enough, and the greatest riches, Matt. vi. 11, 19-21, 25-34; community of goods, the rich selling their property, and a steward keeping a common bag for the benefit of all, Matt. xix. 21, Luke xii. 33, John xii. 6, xiii. 29, Acts ii. 44, 45, iv. 32-55; all were on a perfect equality, Matt. xx. 25-28, xxiii. 8-12, Mark ix. 35-37, x. 42-45; to be meek and lowly in heart, poor in spirit, merciful, pure in heart, peace-makers, to hunger and thirst after righteousness, Matt. v. 1-9, xi. 29; the healing of the body to be combined with that of the soul, as by Christ the power to exorcise demons, to perform miraculous cures, &c., was given to the faithful, Matt. x. 8, Mark xvi. 17, Luke ix. 1, 2, x. 9; that oaths should never be used, Matt. v. 33-37; to take nothing with them on a journey, Matt. x. 9, 10, Mark vi. 8-10; to make no weapons of war, Matt. xxvi. 52, only weapons might be carried on a journey for defence against robbers, Luke xxii. 36; that celibacy was a higher kind of life than matrimony, although some among them had wives, Matt. xix. 10-12, 1 Cor. vii. 32-35; not to offer animal sacrifices, but their own bodies, Rom. xii. 1; to live such a life of purity as to be temples of the Holy Ghost and be able to prophesy, 1 Cor. vi. 19, xiv. 1, 39; a threefold rule for the conduct of their life—love of God, of virtue, of mankind, Matt. xxii. 36-40; to despise philosophy except in so far as it treated of the existence of God, Col. ii. 8; a supreme love for the members of the brotherhood, Rom. xiii. 8, 1 Tim. iv. 9, 1 Peter i. 22, ii. 17, 1 John iii. 14, iv. 7, 11, v. 2.

As the majority lived in celibacy, the brotherhood had to be kept up by proselytes. The best material for these of course was children, whom they preferred. Grown-up candidates had to pass through a noviciate of two stages extending over three years, attaining in succession seven different degrees of purity or holiness: (1) outward or bodily purity by baptisms; (2) celibacy; (3) inward or spiritual purity; (4) the possession of a meek and lowly spirit; (5) being a temple of the Holy Spirit and able to prophesy; (6) being able to perform miraculous cures and raise the dead; (7) being like Elias, the forerunner of the Messiah. Our Saviour described John Baptist as having attained the highest degree of Essene purity (Matt. xi. 14); and as much of the Sermon on the Mount is expressed in Essene phraseology, and still more is in accordance with its spirit, it has been thought probable that Christ himself may have in his youth been instructed by members of the sect. The original authorities on the subject are Josephus, Philo, and Pliny. The first to show the true relations of the E. to allied sects was Frankel.

Essen'tial Oils, or **Ethe'real Oils,** are substances which in their chemical constitution and properties differ entirely from common or fixed oils; but they are closely allied to resins, into which, through oleo-resins, they insensibly merge. At ordinary temperatures they are for the most part fluid, and such as are solid melt readily without decomposition, and they also undergo distillation without change. They possess a burning taste and a powerful odour, which in some is very pleasant, while in others it is equally repulsive. Their smell is due to the fact that the gaseous particles they evolve are very energetically acted on by oxygen. Some are pure hydro-carbons (*i.e.*, compounds of carbon and hydrogen), others contain oxygen in addition, and in the malodorous series sulphur is also present. Under the influence of cold many of them separate into two distinct bodies, a solid crystalline stearoptene and a fluid elaoptene. E. O. are very sparingly soluble in water, but dissolve freely in alcohol, ether, bisulphide of carbon, chloroform, and the fixed oils. Such of them as possess a pleasant odour are extensively employed in perfumery, others are largely used for flavouring articles of food, others are valued in medicine, and a few are employed in the arts as solvents, &c. The following is a list of the principal E. O.:—Orange, neroli, bergamot, lemon, lime, petit-grain, bitter almond, lavender, peppermint, mint, rosemary, marjoram, thyme, carraway, anise, sweet fennel, cajuput, sassafras, cinnamon, cassia, clove, pimento, nutmeg, sandalwood, rosewood (*Convolvulus scoparius*), geranium, winter-green, patchouli, vetiver, citronelle (species of *andropogon*), cedarwood or juniper, and Calamus aromaticus.

Essequi'bo, a river of British Guiana, S. America, rises in the Serra-Acaray, to the E. of the Moon Mountains, between British territory and Brazil, flows in a direction almost always due N. through impenetrable forests, and enters the Atlantic after a course of upwards of 550 miles, broken by numerous cataracts. Its mouth forms an estuary 20 miles wide, in which are several islands, such as Hog, Leguan, Tiger, and Wakenaam. Small schooners can proceed nearly 50 miles up the river.

Ess'ex, a county in the S.E. of England, bounded N. by Suffolk and Cambridge, W. by Hertford and Middlesex, S. by the estuary of the Thames, and E. by the German Ocean. E. is well watered by tributaries of the Thames, as well as by the Crouch, Chelmer, and Colne. The surface, which in the N. and in the centre is richly wooded, and on the coast partly sandy and partly marshy, nowhere reaches a great elevation. The highest point is Langdon Hill, 620 feet above the sea-level. Of the 985,545 acres which constitute the area of land and water in E. (not including tidal water) 344,133 are under corn crops (wheat 124,592), 100,494 under green crops (potatoes 10,929, and turnips and swedes 28,116), 83,405 under clover, sainfoin and grasses in rotation, and 253,998 under permanent pasture and grass (hay 114,790). Flax is cultivated on 195 acres, and small fruit on 1527, while 43,722 are bare fallow or uncropped arable land. Mountain and heath land cover 1248 acres, nursery grounds are laid out over 374, and woods and plantations cover 28,784. In the neighbourhood of London, chemicals, tar, &c., are manufactured. There are silk-mills at Colchester, Braintree, Halstead, &c. Straw-plaiting employs numerous hands in the villages, and there are cement and whiting manufactories, iron-foundries, and brick-works. Oyster-fishing has been long a profitable industry. Calves and lambs are raised in large numbers for London, and the county is famous for its breed of pigs. See articles CATTLE, HORSE, PIG, SHEEP. In the time of the Romans this part of the island was occupied by the Trinobantes, and was included in the Roman province *Flavia Cæsariensis*. It was the nucleus of one of the kingdoms founded by the Low German invaders of Britain, from whom it received its present name of an E. or 'East-Saxon' land. Pop. of E., ancient county 785,445; reg. county 761,191; and adm. county 579,355. E. contains eight parliamentary divisions, each of which returns one member: E. or Maldon, 54,572; Mid or Chelmsford, 58,304; N.E. or Harwich, 55,623; N. or Saffron Walden, 47,449; S.E., 69,837; S. or Romford, 103,546; S.W. or Walthamstow, 101,236; and W. or Epping, 55,416.

Essex, Earl of. See CROMWELL, THOMAS.

Essex, Robert Devereux, Second Earl of, son of Walter Devereux, first Earl, was born at Netherwood in Herefordshire, 10th November, 1567, studied at Cambridge, was introduced at court by Burleigh in 1584, and gained the favour of Elizabeth. In 1585 he accompanied the Earl of Leicester in his expedition to Holland, and showed great bravery in the battle of Zutphen. On the death of Leicester, E. succeeded to his place in the Queen's affections, and honours were showered upon him. He commanded two expeditions against Spain, in the latter of which Cadiz was captured, and was made Earl Marshal of England and Chancellor of Cambridge University. At the same time he acquired a high reputation beyond the limits of the court by his generous patronage of men of letters and science, such as Shakespeare and Bacon. But popularity turned his head. He offended the Queen by rudeness. In spite of this he was appointed (1599) Lord Lieutenant of Ireland when the larger portion of that island was in rebellion. He failed, however, to allay the disorders, and was recalled. Returning to London, E. madly put himself at the head of an insurrection, was imprisoned, and after a trial, for his share in which Bacon (q.v.) has incurred deserved obloquy, was condemned to death. His execution took place, 25th February, 1601.—**Robert Devereux, Third Earl of E.,** son of the preceding, was born at Essex House in 1592, studied at Eton and Oxford, and in his earlier years took service under the Elector Palatine and the United Provinces. He was not a favourite with King James or with his son Charles, and soon after the outbreak of the Civil War was appointed general of the Parliamentary forces. He commanded at Edgehill (1642), took Reading (1643), compelled the King to raise the siege of Gloucester (1643), but was unfortunate in a campaign in Cornwall, and escaped with difficulty to London. He was received with honour by the Parliament, but ill-health and the growing power of the Independents (E. was a moderate Presbyterian) induced him to withdraw from public affairs. He died 14th September, 1646. See Green's *Short History of the English People*.

Ess'ling, a village of Austria, 5 miles E. of Vienna, together with Aspern (q.v.) the site of a fierce but indecisive battle between Napoleon and the Austrians, 21st-22nd May, 1809. From it Massena got his title of 'Prince of E.'

Ess'lingen, a walled town of Würtemburg, on the Neckar, 9 miles E.S.E. of Stuttgart by railway. It has a fine Gothic *Frauenkirche* (14th c.), with a spire 230 feet high, an old castle, a rare old townhouse (1430), a well-endowed hospital, and extensive manufactures of machinery, cottons, woollens, paper, silver ware, and wines. E. is specially celebrated for its locomotive engines and its 'champagne,' a sparkling Neckar wine. E., founded in the 8th c., was made a free city of the German Empire under Otto IV. in 1209. The Swabian Bund was formed here in 1488. A school for knights existed till 1733 at E., which was the scene of many tournaments. The town suffered severely in the Thirty Years' War. It came to Würtemburg by the peace of Lunéville in 1802. Pop. 22,234.

Essoign' (Fr. *ensoigne*, *essoin*, from *soin*, 'care,' 'labour'), in English law, an excuse on oath on ground of sickness or other sufficient cause for non-appearance by one called in an action. *E. day of term* was the first day of the term on which the courts were open, essoigns or excuses being then, according to ancient custom, heard for those who had not appeared according to the summons. Statute 11 Geo. IV. and 1 Will. IV. c. 70 abolished E. day of term as part of the term. In Scotch law the form is *Essonium* or *Essonzie*.

Ess'ouan, or **Es'wan.** See ASSOUAN.

Estab'lished Church is a Church recognised and supported by the state. The relation in which the Church may be said to stand to the state depends on the definition of the nature of the Church. The form of the Christian Church was—(1) The little community at Jerusalem. (2) As soon, however, as another such community was formed elsewhere, and one member of the Church was dead, a new idea was formed of the Church as a spiritual body, bounded by no limits of space or time, but composed of those (and none else) of whom it is written, 'As many as are led by the Spirit of God, they are the sons of God.' In process of time the theory came to be developed (3) that the Church is essentially an externally organized society, all those born within its pale being its members and entitled to all its privileges—its sacraments and ordinances—in virtue not of their character but of their birthright. It is in this sense only—in which baptized persons are everywhere claimed as Christians—that there can properly be a *national* E. C. Before the Reformation nations were held by the Church to be Christian as nations, and with the development of the Popedom the Church became not only national but Catholic. After the Reformation Protestant Churches which kept the doctrine of baptismal regeneration could properly enough maintain their national character, the headship being vested in the sovereign instead of the Pope. It thus appears that it is an impropriety to speak of an alliance between a national Church and the state, because they are identical. Owing, however, to the growth of dissent in modern times, it is customary to speak of the relation existing between the Church and the state as an alliance; and the arguments for and against such a relation existing may be here briefly stated. The controversy is carried on both on the ground of *divine authority* and on that of *utility*. 1. *Divine authority*.—It is contended that the teaching of Scripture is in favour of a national E. C. both as to the principle and as to its application. (1) As to the principle, Scripture teaches that Jesus Christ is the supreme king over all kings and rulers, and head not only of his Church but of all nations: Ps. ii. 12 (applied to Christ, Acts xiii. 33); lxxii.; cx.; Eph. i. 21, 22; Rev. *passim*. (2) As to the application—(*a*) in Melchizedec the offices of priest and king were united (the closest conceivable union of Church and state), in respect of which he was a type of Christ (Heb. vii. 1, 2); and further, Abraham's paying tithes to Melchizedec was a type of the rights of the priesthood of Christ (Heb. vii.). (*b*) The Mosaic ordinances for the payment of tithes to the priests amounted to a national establishment and endowment of the Church. It is held on this side to be no valid objection that the Jewish system was a pure theocracy, because it was founded on principles of moral obligation which are applicable in all time. (*c*) In reference to the Gospel dispensation, it is contended that 'when the ordinance of God in behalf of kings and other rulers (as in Rom. xiii. 1, 2; 1 Tim. ii. 1, 2; 1 Pet. ii. 13-15) was so explicitly renewed, if it had been intended to impose any new and peculiar restriction upon their authority, it is impossible to suppose that it would not have been made known.' The objections and arguments on the other side under this head are in brief as follow:—(1) 'That there is no precept of the gospel under which an E. C. is required and enjoined, and that there was no such institution during the first three centuries.' (2) 'That Christ himself declared that his kingdom is not of this world: John xviii. 36.' (3) 'That a civil government is not competent to specify what ought to be the nation's creed, and cannot therefore be supposed to have divine authority to do so.' (4) 'That the maintenance of any particular system of religion at the public expense, and consequently more or less at the expense of dissenters, is anti-scriptural, unjust, and a violation of the rights of conscience.' 2. On the ground of *utility* it is argued, on the one hand—(1) That an E. C. is necessary for keeping up a supply of ministers and religious ordinances proportioned to the spiritual wants of the people; and asserted that the voluntary system, when it has been tried, has signally failed in giving such a supply in poor and thinly-inhabited parts. (2) That there are great advantages in the ministers of religion being independent of those to whom they minister, because when dependent on them they are under a temptation to accommodate their ministrations to the wishes rather than to the wants of men. (3) That an E. C. not only promotes religion generally, and thus strikes at the root of all crime, but tends to consecrate the state itself and the rulers of the state. On the other hand it is argued—(1) That ministers being independent of their flocks tends to make them indolent and indifferent in the discharge of their duty, and that the organization of an E. C. leaves little room for burning zeal and intense vitality. (2) That 'civil legislation ought not to extend beyond the outward secular affairs of communities,' and that the best thing the state can do for religion is 'to let it alone,' because all the good done by an E. C. can be done better on the voluntary principle. (3) That although it was impossible for the state to let religion alone at the time when National Churches were established (because it was then the universal conviction that it was the duty of rulers to care for the religious condition of their subjects, because religion was then too formidable a power to be let alone, and because such a course would then have entailed great spiritual destitution), Established Churches are now an anachronism.

Estate', in English and Scotch law, has the same signification as property. In England, property is either real or personal. Real property consists of lands, tenements, and things immoveable. Personal property, or personalty, consists of money, goods, leases, and other moveables which either are or easily may become transferable. Nearly all the real property of England is supposed to have been granted by a superior, from whom it is held in consideration of certain services to be rendered to him by the possessor. By the 12 Car. II. c. 24, which abolished the military tenures, commuting them for a grant of excise and customs, only the honorary services of grand sergeanty are reserved, such as carrying the king's sword or banner, or officiating as butler or carver at the coronation. Real property, by the law of England, can only be acquired in two ways, by Descent (q.v.) and by purchase. See PURCHASE OF ESTATES, ENTAIL; see also HEREDITAMENT, MANOR. In personalty, see CHATTELS. Regarding tenures of real E., see BOROUGH ENGLISH, BURGAGE, COPYHOLD, COMMON TENANCY, FREEHOLD E., GAVELKIND, SOCAGE. See also, applicable to real and personal E., JOINT-TENANCY. Respecting transfer of land, see REGISTRATION OF TITLE TO LAND. In Scotch law, see HERITABLE AND MOVEABLE, MOVEABLES.

Estates of the Kingdom are three in number, the Lords Spiritual, the Lords Temporal, and the Commons. In the ancient Parliament of Scotland the three estates of the realm were, according to Erskine, 1st, the archbishops, bishops, abbots, and mitred priors; 2nd, the barons, including commissioners of shires and stewartries; and 3rd, the commissioners from royal burghs.

Es'te (anc. *Ateste*), a town in the province of Padova, N. Italy, at the foot of the Euganean Hills, 18 miles S.W. of Padua. It was a Roman colony, was a place of importance under the Empire, and still contains numerous ancient inscriptions. The *Rocca* or Castle of E. overshadows the town, and the church of San Martino has a leaning campanile. There are manufactures of silks, hats, and pottery. The town gives name to the House of E. Pop. 10,653.

Este Family, one of the most princely houses of Italy, famous for the splendid patronage which it accorded to the arts and sciences, traces its origin to some of the Tuscan feudatories of the Karolings. Alberto Azzo II., the founder of the house of E., was invested by the Emperor Heinrich III. with Rovigo, Casal-Maggiore, and other Italian states. His sons, Welf or Guelfo IV. and Fulco I., are the heads of the two great branches of the family—the Welf-Este or Guelf-Este (German branch), and the Fulco-Este (Italian branch). Welf IV. was invested with the dukedom of Bavaria by the Emperor Heinrich IV. From him the houses of Brunswick and Hanover, and consequently the later sovereigns of England, draw descent. Fulco I., who died in 1135, is the progenitor of the dukes of Modena and Ferrara. The E. F. headed the Welfic or Guelfic party—the minor principalities and free cities of Northern Italy—in their conflicts with the emperors. It first acquired Ferrara, and later Modena and Reggio; at the same time its successive representatives began to distinguish themselves as lordly patrons of literature and the arts. The Marchese Obizzo (who died 1190) entered into the Lombardic league against Friedrich Barbarossa, but was afterwards confirmed in all his fiefs by the emperor, and raised to the *marchesato* ('marquisate') of Milan and Genoa. By his marriage with Marchesello, daughter of Torello, the head of the Guibellini, the E. F. acquired extensive possessions in Romagna and the March of Ancona. Azzo VII. (died 1264), after a long struggle, inflicted a severe defeat on the Guibellini in 1259, and completely re-established the tottering fortunes of the house of E. Obizzo II., born about 1240, received from the Emperor Rudolf I. the investiture of all the Italian states under imperial suzerainty, and was freely elected to the seignories of Modena and Reggio. Nicolo III. (born 1384, died 1441) re-established at Ferrara the university founded there by his father. Borso, first Duke of Ferrara and Modena, one of the most distinguished princes of his age, encouraged letters and established printing in the Italian states. He died in 1471. Alfonso I. (died 1534) was distinguished as a general and a statesman, and was celebrated in the verses of Ariosto and all contemporary Italian poets. His second wife was the notorious Lucrezia Borgia. Ercole II. (died 1559) and his brother, the Cardinal Hippolito, were liberal patrons of the arts. The latter built the magnificent Villa d'Este at Tivoli. Alfonso II. (died 1597), the most magnificent of contemporary Italian princes, is chiefly remembered for his harsh treatment of Tasso, whom he imprisoned as a madman for seven years. After him the E. F. was represented by a long series of undistinguished princes. Rinaldo, Duke of Modena (died 1737), married Charlotte Felicitas of Brunswick, daughter of the Duke of Hanover, and thus united the two great branches of the E. F., which had remained separate since 1071. Ercole Rinaldo III., who acquired by marriage the principalities of Massa and Carrara, fled to Venice on the approach of the French troops in 1797. He lost Modena and Reggio through the peace of Campo Formio, and died in 1798—the last male representative of the E. F. His daughter, Maria Beatrice Ricarda, was married to Ferdinand, the third son of the German emperor, Franz I., who obtained the duchy of Breisgau as indemnity for the lost provinces, and died in 1806. Of their two sons, Francisco IV. acquired the possession of the duchy of Modena. He was succeeded in 1846 by his son Francisco V. (died 20th November, 1875), who, as a consequence of the revolution of 1859, lost his territories, and at the consummation of Italian unity in 1860 disappeared from the land in which his ancestors had held the state of kings.

Estell'a (from a Basque root, *ast*, 'a rock'), a city of Spain, province of Navarra, on the Ega, 27 miles S.W. of Pamplona. It has always been a stronghold of the Carlist party, and on the 27th May, 1874, was the scene of a fierce and bloody struggle in which the Republicans were defeated. Another battle took place near it, 13th April, 1875, in which the Carlists in turn were beaten. There are some woollen and linen manufactures, and a trade in grain and fruit. Pop. 5974.

Este'pa (Basque, 'rocky ground'), a town of Spain, province of Sevilla, 60 miles E.S.E. of the city of Seville, with manufactures of oil and cloth; a trade in grain, cattle, wool, and fruits, and a pop. of 9059. The church of Santa Maria is an imposing and well-preserved Gothic structure.

Estepo′na (Basque, 'rocky ground'), a town of Spain, province of Malaga, 23 miles N.N.E. of Gibraltar, supplies the fortress with fruit and vegetables, and has some manufactures of linen and leather. Pop. 9771.

Ester, a term in chemistry signifying an acid, or salt of hydrogen, in which the hydrogen has given place to an alkyl or alcoholic radicle. An E. may, therefore, be defined as alkyl salt of oxygenated acid.

Es′terhazy (originally **Estoras,** then until 1584 **Zerhazy), of Galantha,** the name of an Hungarian family. Of the Frakno branch, **Nikolaus I.** in the latter half of the 17th c. worked hard to spread the Lutheran reformation in Hungary.—**Paul IV.,** born 8th September, 1635, showed great military skill against the Turks at Essek, Kanisa, &c., in 1664; took several forts, *e.g.*, Segedin and Bartz; and became during the peace governor of the frontier. In the Diet he supported Austrian influence, especially in the declaration of male succession of 1687. He raised the siege of Vienna in 1683, and after many public services became a Prince of the Empire, and received from Charles VI. the right to coin money and to grant patents of nobility. He had refined tastes, and introduced to Hungary the *Atlas Marianus*, or collection of portraits of the Virgin with a history. He died 20th March, 1713.—**Nikolaus II.,** born 17th December, 1765, was at the head of the Hungarian army of defence raised against the French invasion of the Austrian duchies. Napoleon tried to bribe him by an offer of the Hungarian crown. He was the patron of Haydn, and the founder of a famous picture gallery at Vienna. He died at Como, 28th November, 1833.—**Paul Anton,** born 10th March, 1786, had a long diplomatic career. He negotiated the marriage of Napoleon and Maria Louisa, was minister at London from 1815-18, and from 1830-38. Returning home, he joined the party of Nationalists, and in 1848 was for a time in the Batthyanyi ministry. He died at Regensburg, 21st May, 1866.—The present head of the family is Paul Anton Nikolaus, who was born on 21st March, 1843, and succeeded his father as prince on 28th January, 1894. His mother was Lady Sarah Villiers, of the family of the Earl of Jersey.

Est′her, Book of, one of the books of the Old Testament, which gives an account of a remarkable deliverance of the Jews in Persia, in the time of a king Ahasuerus (*i.e.*, Xerxes I., B.C. 485-464), accomplished by his queen, Esther, a Jewess. It has been debated whether the book contains an authentic historical narrative or is a fiction. As opposed to the authenticity, it is held to be improbable (1) that the royal edict for the massacre of the Jews should have been issued and made public, as is necessarily implied, twelve months before the time appointed for its execution; (2) that it should have commanded the massacre of all Jews in Judæa, which it must have done, since Judæa was at the time a province of the Persian empire, and again inhabited almost entirely by Jews; (3) that the Jews should be able, although permitted by the second edict, in every case to overcome their enemies, and kill 75,000 of them; (4) that the king should send to every province the edict of ch. i. 22; and (5) that Esther should be able so long to conceal her Jewish connection. The strong point relied on as a proof of the authenticity of the book is the existence of the Feast of Purim (q.v.), the name of which is interpreted in the book as the Persian word for *lot* (iii. 7, ix. 24), and which is assumed to imply the events of the book. But this appears to others the strongest proof of its unhistorical nature, since it is the manifest intention of the writer, according to either view, to give the *raison d'être* of the feast. The repeated explanation of *Pur* (iii. 7, ix. 26, 28, 31) is thought to point to this, whereas no Persian word *pur*, 'lot,' is known. In the circumstances the explanation offered is that Pur was a Persian feast, in the celebration of which the Jews had begun to take part here and there (ix. 19), and that the author's aim in writing the work was to bring the feast into general popularity with his countrymen (ix. 20, 27). The language also points to a late period for its composition. See Kuenen's *Religion of Israel* (Eng. trans. 1875).

Estho′nia, or **Rev′al** (native *Viroma*, 'border-land,' Ger. *Esthland*), a government of Russia, and one of the Baltic provinces, is bounded N. by the Gulf of Finnland, E. by St. Petersburg, S. by Livonia, and W. by the Baltic. It is for the most part flat, and one-fourth of the surface is covered with birch and pine forests. The soil is partly sandy, partly marshy, and yields much grain, hemp, flax, and tobacco. Reval (pop. 52,644) is the capital, and the government includes the island of Dagöe. The upper classes and inhabitants of the towns are chiefly a mixed German, Swedish, and Russian people called *Esthländer*, while the country folk are mainly the aboriginal *Esths* of Finnish race. Ninety-six per cent. of the inhabitants are Lutherans. The language of the Esths, which is mild and melodious, is rich in ballads and folklore. The chief poem in the language is the epic *Kalexa Poig*. Ahrens published an Esthonian grammar in 1853. In the 10th and 12th centuries E. belonged to Denmark, but it was sold to the Knights of Livonia in 1347. It was annexed by the Swedish Erik XIV. in 1561, and was finally seized by Peter the Great in 1710. Area 7818 sq. miles; pop. 401,000.

Es′toile, in heraldry. See STAR.

Estopp′el (Old. Fr. *estouper*, 'to stop'), in English law, is a bar to a right of action arising by matter of record, by deed, or in pais (where a tenant cannot dispute his landlord's title). The same is known in the law of Scotland under the term *Personal Objection* or *Exception*.

Esto′ver (Fr. *estoffer*, 'to furnish'), in English law is the right of taking necessary wood from another's estate for household use, to make and repair implements of industry, and to repair hedges and fences. See COMMON.

Estray′. In English law the term is applied to any beast found within a manor or lordship and not owned. If intimation be proclaimed in church, and be given by the crier in the two next market-towns, on two market-days, and the E. is not claimed by the owner within a year and a day, it belongs to the sovereign, or his substitute, who is generally the lord of the manor. If duly claimed, the owner is entitled to restitution on payment of the expense of maintaining the animal. If legal intimation is not made, the owner is entitled to restitution at any time. If anyone not owning the manor on which the beast is E., find and take care of it, the owner may recover it without paying the expenses of maintaining it.

Estreat′ (Fr. from Lat. *extractum*), in English law, is a true copy, extract, or note of an original writing, especially applied to a record of a fine, recognizance, &c., entered in the rolls of court. If the condition of a recognizance be broken, the recognizance becomes forfeited; and being *estreated* or extracted from the record and sent to the Queen's Bench Division, the fine must be levied by Queen's Bench process.

Estremadu′ra (Lat. *Extrema Durii*, 'the extreme limits of the Douro'), a province of Portugal, is bounded N. by Beira, E. and S. by Alemtejo, and W. by the Atlantic, contains the districts of Leiria, Santarem, and Lisboa, and has an area of 6876 sq. miles, and a pop. of 1,083,290. It is watered by the Tagus and its tributaries, and is intersected from N.E. to S.W. by the granite range of the Serra da Cintra. These mountains reach to a height of 1800 feet, and terminate, near the mouth of the Tagus, in the Cabo de Roca. To the S.E. the surface is marshy and sterile, but the hill slopes and valleys yield abundance of grain, wine, oil, cork, and fruits, while everywhere there is a profusion of the finest flowers. E. is subject to frequent earthquakes. The chief minerals are coal, granite, and marble.—**E.** is also the name of a former province of Spain, now divided into Badajos and Caceres. Area, 16,700 sq. miles; pop. 821,301. It lies between the Portuguese frontier and New Castile, and is intersected from E. to W. by the Tagus and the Guadiana, the basins of which are separated by a sinuous mountain range. The N. and S. portions are also mountainous. The rich botanical and mineral resources of E. are almost entirely neglected, and the only extensive occupation is sheep-rearing.

An old right of pasture (*mesta*) has long since put an end to the cultivation of the soil.

Estremoz′, a town of Portugal, in the district of Evora, province of Alemtejo, 25 miles N. by E. of the town of Evora. It is defended by a strong citadel. E. is famous throughout the peninsula for its earthenware, especially of vessels for cooling liquids, which are still cast in purely classical forms. Pop. 13,691.

Esz′ek, or **Ess′ek** (Slav. 'high place'), a free town and capital of Slavonia, Hungary, on the right bank of the Drave, 12 miles above its confluence with the Danube. It is fortified, and has an important transit trade in grain, wood, iron, wine, and flax, especially since steamers have been placed on the Drave. Pop, 20,240, mostly Catholics, and of Servian stock. On 14th February, 1849, Count Batthyanyi, who for several weeks had held E. for the Hungarian revolutionists, capitulated to Baron Trebersberg, the imperial general.

Étampes, formerly **Estampes**, a town in the department of Seine-et-Oise, France, on a river of the same name, 31 miles S.S.W. of Paris by railway. It is four miles long, and has several famous churches which rank among the historical monuments of France, the *Notre Dame* (13th c.), *Saint Basile*, built by King Robert, and a specimen of pure Romanesque, *Saint Martin* (12th c.), &c. There are also remains of an old castle and fortifications. E. has forty flour-mills, besides tanneries, linen, thread, and soap factories, &c. The town existed under the Merwings. It was dismantled by Henri IV. in 1590. Pop. of commune 8573; of arrond. 41,551.

Etang′ de Berre, a salt lake in the S. of the department of Bouches-du-Rhône, France; greatest length 12½ miles, breadth very irregular. Rich salt works have been erected on its bank, and numerous coasters from the Mediterranean trade to the port of Berre on its S.E. shore.

Etawah, the capital of a district of the same name in the N.W. Provinces, British India, a mile E. of the left bank of the Jumna, and on the East Indian Railway, 710 miles N.W. of Calcutta, and 1835 E. of Delhi. It is an ancient town, with numerous *ghâts* or bathing-steps leading down to the river. Its modern prosperity is due to its position on the Jumna and on the road from Agra to Cawnpore. One of the main branches of the Ganges Canal here opens into the Jumna. There is a great mosque on the Gwalior road, which presents many interesting relics of ancient art. The Asthala temple, surrounded by a grove, is one of the most sacred places in the Hindu religion. It was built in honour of one of the incarnations of Vishnu, only about 100 years ago, and this was, of course, before the Mohammedan invasion. Under the Mogul empire it flourished considerably, but when it was left unprotected to the rapacity of Rohilla and Mahratta freebooters, it speedily declined until the British took possession. Pop. 38,793.—The *district*, which lies in the Doab, between the Ganges and Jumna, has an area of 1691 sq. miles, and a pop. of 727,629. Of these 682,863 are Hindus, 42,325 are Mohammedans, 2117 are Jains, 134 are Christians, and 2 are Parsees. E. is well watered both artificially and naturally, and the Cawnpore Branch Canal is sufficiently near to be useful. A large portion of E. is covered by jungle. Wild beasts are numerous, and game is plentiful. It yields wheat, barley, and grain in spring, and opium, sugar-cane, cotton, indigo, rice, and millet in autumn. E. was formerly a great haunt of Thugs, or secret and systematic murderers. In a single year (1808) as many as sixty-seven dead bodies were taken out of the wells in the district.

Etch′ing. See ENGRAVING and GLASS.

Ethel′bert, properly **Æthelberht**, a descendant of Hengist, and son of Ermenric, King of Kent, began to reign in 565. He was defeated in 568 at Wibbandun, Surrey, by Ceawlin of Wessex, but by valour and prudence increased his dominions, and about 590 was acknowledged as *Bretwalda*, his supremacy extending over Middlesex, Essex, and E. Anglia. His wife, Bercta, daughter of Chariberht, King of Paris, being a Christian, Gregory the Great resolved to attempt to convert him and his subjects, and sent Augustine with a band of priests to England. They landed on the Isle of Thanet in 597, and were listened to in the open air by E., who in the next year embraced Christianity. His people followed his example, the language and arts of Rome began to return with the new religion, and England was again brought into contact with the other nations of Europe. In this reign codes of law were published, and the bishopric of Rochester was established. E. died in 616. See Bede's *Hist. Eccl. Gentis Angl.* (lib. i.), and Freeman's *Hist. of the Norm. Conq.* (vol. i.).

Ethelre′da, properly **Æthelreda**, an East Anglian princess of the 7th c., who was canonised, and whose name was shortened to St. Audrey, of which our word *tawdry* is perhaps a corruption, from the gaudy toys and laces sold at a fair held in her honour in the Isle of Ely.

E′ther, also called **Sulphu′ric Ether** and **Ox′ide of E′thyl**, is obtained from spirits of wine by the action of dehydrating agents. To prepare it a capacious retort, either of glass or sheet-iron coated with lead, is connected with a good condensing apparatus. Through the tubulure of the retort a tube passes which is connected with a vessel containing spirits of wine of 0·83 specific gravity. This tube is provided with a stopcock to regulate the flow of spirit into the retort. The retort is charged with a mixture of 5 parts of spirit and 9 parts of oil of vitriol, and heat is applied until E. begins to distil over. The stopcock of the spirit reservoir is then opened, and the spirit allowed to flow into the retort at the same rate as the E. distils over. The level of liquid in the retort is thus kept constant. The process is continuous and only ceases when the oil of vitriol becomes too much diluted to remove more water. Formerly it was believed that in this process the sulphuric acid simply acted as a dehydrating agent, removing one molecule of water from two of alcohol to give E.

The experiments of Williamson have, however, shown that the dehydration is not effected directly, but in two stages. In the first of these, sulphuric acid acts upon alcohol, forming sulphovinic acid and water.

The sulphovinic acid then acts on alcohol to form E. and sulphuric acid.

The crude E. which distils over is purified by washing with milk of lime and water, and subsequent rectification. E. is a colourless mobile liquid, having a pleasant odour and burning taste. It is very volatile, and boils at 34·5° C. It is much lighter than water (sp. gr. 0·723), and therefore when agitated with that liquid separates after a short time in a layer which swims on the surface. It is employed in medicine as a stimulant and antispasmodic, and is also largely used as an anæsthetic, being considered by many surgeons safer than chloroform. It is an excellent solvent of fats, resins, alkaloids, &c., and is used for that purpose in the arts. Owing to its volatility and the cold produced by its evaporation, it is employed in several freezing machines.

Ethers are compounds of hydrocarbons, or of hydrocarbon radicals with elements or acids. Compounds of hydrocarbons and their radicals with elements are called *simple* E., while their compounds with acids are called *compound* E. Many of the latter occur in nature, and of these the Fats (q.v.) and many fruit essences are important examples. Thus oil of pears is the acetate of amyl; oil of pine-apple, butyrate of amyl, &c.

Ether, Luminif′erous, the medium which is supposed to fill all space, and in which the phenomena of light, radiant heat, and probably electricity and magnetism, take place. The necessity of such a medium for the transmission of light is admitted, but there is still an evident reluctance on the part of some to extend its properties so as to embrace electric and magnetic phenomena. The gradual diminution of about two hours per revolution in the periodic time of Encke's comet, and the direct experiments of Professors Stewart and Tait on the rotation of a disk *in vacuo*, hint at the existence of a resisting medium; and if such exist, it is to it that we naturally look as the vehicle for the transmission of energy. This E. then, to satisfy all the necessary conditions, must act both as a mobile fluid to permit the easy motion of matter through it, and as an elastic solid to admit of the transmission of light vibrations. Lord Kelvin fixed a superior limit to the density of the medium from calculations founded upon the known velocity of light; and Clerk Maxwell, by making further assumptions regarding its power of *resilience*, has shown that such a medium can account for the more hidden actions of magnetic and electric induction, as well as for the phenomena of light and heat.

Eth'erege, Sir George, one of the Restoration dramatists, was born about 1636 in Oxfordshire. He was educated at Cambridge, travelled on the Continent, and on his return became the associate of Sedley, Rochester, Villiers, and other courtiers of Charles II. He was knighted about 1683, and sent as English minister to Hamburg and Ratisbon, where he died about 1694, from falling downstairs after a carouse. E. has left three comedies—*The Comical Revenge, or Love in a Tub* (1664); *She would if she could* (1668); *The Man of Mode, or Sir Fopling Flutter* (1676). Dryden (*Epistle to E.*) speaks of his terse comic wit, but his characters are flimsy, his dialogue generally trifling, and his plays only interesting from the swift succession of incidents. E. was imitated by Cibber. See Ward's *English Dramatic Literature*, vol. ii.

Eth'ics, or the science of morals, as generally taught, deal with several distinct matters. *First*, the question arises, which has perhaps excited as much metaphysical discussion as any, What is the ultimate standard of right and wrong? The replies are as numerous as the systems of E.: (*a*) The arbitrary will of God, expressed in the Bible as interpreted by the ruler or teacher who desires a sanction for any particular command; (*b*) the arbitrary will of human government regarded as absolutely irresponsible, a conception of Hobbes plausible enough in certain early stages of civilisation—*e.g.*, caste, but not applicable to states having representative institutions, or a diffused political intelligence; (*c*) a certain harmony of fitness, or intellectually perceived rightness of actions, which, as Cudworth says, is eternal and immutable, and which Price apparently classifies with mathematical intuitions, and deliverances of the intellect upon questions of beauty in colour or form; (*d*) the moral sense, which, as explained by Hutcheson, its author, means a susceptibility to certain specific and unique sensations or emotions, the causes of which being actions done or contemplated, we classify as virtuous and vicious, good or bad. (*e*) Self-interest, which was humorously but coarsely expounded by Mandeville in his *Fable of the Bees* as including and explaining all the sublimest virtues —a psychological blunder which has often unjustly been attributed to the Utilitarians. (*f*) The utility or probable consequences of conduct upon the human race directly, and also indirectly through the subsequent conduct of all. It will be seen that fundamentally there are here two views—1st, that the judgment, arrived at by any particular mind on any particular question involving moral relations, shall be held to be sacred and final, whether intellect or emotion predominate in the judgment, and whether the judgment be a simple or a complex operation; (2nd) that, admitting the existence of a faculty of conscience, whether original or derived, its judgments are liable to error, and may be corrected by reference to the true standard, which is an intelligible objective one, deduced from family, social, and political relations. E. is concerned, *second*, with the psychological questions of the Freedom of the Will (q.v.), whether there are, strictly speaking, any benevolent or purely disinterested emotions in the human mind; and, lastly, what is a conscience, a primitive faculty of feeling or knowing, or a derivative growth and combination of the mind, the product, therefore, in part, at least, of the external circumstances under which the human race have lived. The question of primitive benevolence is very interesting and largely misunderstood. It may be said, as by Paley, that virtuous people obey God 'for the sake of everlasting happiness,' for a definite consideration or reward, or to escape some obvious inconvenience or threatened punishment. The reward, for instance, might be the calculated gratitude of the person benefited, or simply a love of admiration, as frequently in the case of pious and charitable bequests. Then if we are painfully affected by compassion, it is said we 'do good,' in the ecclesiastical sense of giving to the poor, in order to get rid of the pain. Again, if benevolence be pleasant to a benevolent person, that may be an ultimate fact of the mental constitution, but it would still only be a mode of self-regarding action to extend our own pleasure, others' pleasure being incidental. Lastly, the ordinary laws of association must, it is said, make many of our habits disinterested, even if they originally sprang from selfish motives. A large and powerful school of ethical writers, including Butler, Bain, Hume, and Adam Smith, maintain, though in very different senses, that, allowing for the influences above mentioned, there is a residual fact of primitive sympathy which urges men to relieve distress and to confer benefits. Perhaps the controversy has to some extent lost sight of the enormous differences which exist between classes and individuals even of the same nation. In some cases no sympathy is discoverable; in other cases it is the principle of life. *Third*, an important ethical question, wholly insoluble, is what is the *summum bonum*. *Summa bona* are as numerous as individual characters; in each case it is to be found in the direction which promises the greatest amount of healthy and vigorous life. The ascetic and the epicurean schools represent duty and happiness as *summa bona;* the first is certainly too contracted, the second is misleading, unless happiness be defined so as to include all the activities of the organism. Modern E. do not deal much with the formal classification of duties. It is a science, not an art. It is the business of moralists and preachers, and especially of private individuals, to elaborate a code of duty. The relations of E. to law, politics, and religion, have of course varied much from time. Many ethical duties are recognised and enforced by law, and the opposite failures in duty, crimes, delicts, and quasi-delicts, are prohibited. Other 'natural obligations,' as they are called in the language of the Roman law, are recognised, not as separately enforceable, but as pleadable in equity by the creditor in them against the performance of counter-duties towards the debtor. Of course the morality of this partial recognition may itself be questioned, and is indeed emphatically condemned by the Christian Scriptures. The political question, how far the state should instruct the intelligence and control the will of the subject, is a fundamental one, and cannot be intelligibly stated, much less thoroughly discussed, except by men familiar with the ascertained laws of psychology.

Ethio'pia. *Name and Geography.*—The Greek *aithiops*, from which the name is derived, is probably a corruption of the native Egyptian name *Ethaush*, although the Greeks regarded it as meaning sunburnt, from *aithō*, 'I light up,' and *ōps*, 'face.' They applied the term—(1) To all dark races of men; (2) to the inhabitants of all southern regions with which they were not acquainted; (3) to all the inhabitants of Africa S. of Mauritania, the Great Desert, and Egypt; and (4) more specifically to the inhabitants of E. That country lay immediately to the S. of Egypt in the Nile valley, extending from Syene (Assouan), or the First Cataract, to the confluence of the Blue Nile and the White Nile. This territory, which nearly corresponds to Nubia, was E. proper, or the kingdom of Meroë; and it is to this that the references in the Bible are generally, if not always, made. But, in truth, the northern was the only boundary that was definitely fixed; and in a more extended sense E. included Nubia, Sennaar, Kordofan, and Abyssinia, while the part with which it is identified in modern times is Abyssinia. The principal feature in the physical geography of the country, as in that of Egypt, was the river Nile. The White or True Nile, from the Nyanza lakes in tropical Africa, and flowing through great marshes, is joined at Khartum by the Bahr el Azrek, or Blue Nile, from the highlands of Abyssinia, and farther down, near Berber, by the Tacazze or Atbara (anciently Astaboras). Between Khartum and Berber was the so-called island of Meroë, which was the favourite capital of the kings in the later period; although, like that of E., this was an ill-defined name, for, belonging first to Upper Egypt, it was gradually shifted southward. The other capital, Napata, was situated on the southern reach of the great bend to the W. made by the Nile. Near it is the sacred rock of Barkal. Just beyond the S.W.

angle of this bend is the island of Argo, which was the limit of the ancient Egyptian conquests of the country.

Race and Language.—At the present day E. is inhabited by a great variety of tribes of a race intermediate between the Negro and the Aryan and Semitic races. Nearest to Egypt is a very dark tribe, the Kunuz, said to be of Arab origin; next, the Nubeh, much fairer; next come tribes of Arab blood, but fair; the distinctly-marked Semitic Abyssinians; and, lastly, tribes as dark as negroes, though not of the pure negro type. When the race of Kîsh (Cush) is represented on the Egyptian monuments by a single individual, he is of the negro type; and in one passage at least of the Bible (Jer. xiii. 23) Ethiopian appears to be equivalent to negro. There are strong reasons for thinking that in primitive times there was a stream of migration from E. through Arabia, Babylonia, Persia, to Western India (*Genesis of the Earth and of Man;* Rawlinson's *Herodotus*). But, on the other hand, there must have been later a stream of Semitic migration in the opposite direction. The predominant races in Abyssinia at the present day are Semitic, and must have crossed the Red Sea from the W. of Arabia. The settlements of the descendants of Kîsh (Gen. x.) may be traced from Meroë to Babylonia; and by the E. 'compassed' by the river Gihon (Gen. ii. 10) is probably meant the S. of Arabia. The Ethiopic or Gîz, which is the ancient and only written language of Abyssinia, and in which there is a complete translation of the Bible and other religious and historical works, has a strong affinity both in the forms of the alphabet and the grammatical structure with the old Arabic. Gîz ceased, however, to be the vernacular of the country in the 14th c., and was superseded by the Tigre and the Amharic, which are regarded by the best authorities as dialects of the former.

The ancient history of E. is part of the history of Egypt (q.v.). For the modern history of E. see ABYSSINIA. See R. S. Poole, in Kitto's *Cyclopædia of Biblical Literature;* and Birch's *Egypt from the Monuments.*

Eth'moid, one of the bones of the cranium, placed between the orbital plates of the frontal bone, immediately behind the root of the nose, and entering also into the formation of the orbits and of the nasal fossæ. It is so termed (from *ethmos*, 'a sieve,' and *eidos*, 'form'), as it is perforated by numerous minute openings for the passage of the olfactory nerves to the nose.

Ethnol'ogy (Gr. *ethnos*, 'nation' or 'race,' and *logos*, 'a discourse') is the science of the fundamental resemblances and differences of human species or races. The procedure is to divide the human family into classes, sub-classes, varieties, sub-varieties, sections, and sub-sections, according to some well-marked types of physical organization, and then to accumulate evidence on each of these divisions from languages, religions, folklore, laws, customs, institutions, works of art and industry, &c. This evidence, which is being always collected by able specialists, tends in the first place to test the accuracy of the original classification, and in the next place to suggest the permanent conditions under which the great modifications of both physical and spiritual organization have taken place. It is hardly necessary to add that E. or anthropology accepts analogies from the comparative biology of the lower animals, and that the larger facts of written history are also made use of. The special name of Zoological Anthropology is given to that part of the science which deals with the relations of man and the brutes—relations which are seen in geographical distribution as well as in general biology. This conception has been extended by Agassiz to the vegetable kingdom. Let us take the more recent, and perhaps the more trustworthy, classification, that of Huxley:—(1) The Australioid type. The males are of fair stature, with well-developed torso and arms, but very slender legs. The colour of the skin is some shade of chocolate brown, and the eyes very dark brown or black. The hair is fine and silky, usually raven black, never woolly, but wavy and tolerably long. The Australians are dolichocephalic (long-skulled), the cranial index often not amounting to more than seventy-one or seventy-two; the nose is broad rather than flat, the jaws heavy, the lips very coarse and flexible, and the *Norma occipitalis* is sharply pentagonal. The brow-ridges are strong and prominent, the teeth large, and the fangs strong. These marks are seen in the Dasyu hill tribes inhabiting the interior of the Deccan. The ordinary Coolie is nearly Australian. The Egyptian, too, though changed by civilisation and probably admixture, has also the dark skin, black silky wavy hair, long skull, fleshy lips, and broad *alæ* of the nose. (2) The Negroid type is best represented by the negro of S. Africa (including Madagascar), between the Sahara and the region of the Cape. He is of fair stature; his body and limbs are well made; his skin is black, with shades of brown; his eyes, brown or black; his hair is black, short, and crisp; his beard and body-hair scanty. He is dolichocephalic, the cranial index being often only seventy-three. His forehead is childlike and feminine. The *norma occipitalis* is often pentagonal. Like the Australioid, there is generally prognathism (protruding jaws). The nasal bones are depressed, giving a characteristic flat nose. The lips are coarse and projecting. The Bushmen of the Cape area are a special type, marked by low stature, the males not much exceeding 4 feet in height; both sexes, however, are well made. The skin is yellowish brown, the eyes and hair black, the latter woolly. The antero-posterior diameter of female pelvis is of great relative length. Hottentots are said to be a cross between Bushmen and Negroes. Another modification, the Negritos, occurs in the Andamans, Malacca, Philippines, Tasmania, and the islands parallel to the Australian coast, from Wallace's Line to New Caledonia. The Andamans have a cranial index of eighty; all the rest are dolichocephalic, though some in the S. and E. approach the Australioid in large brow-ridges and otherwise (*e.g.*, Tasmania, New Caledonia, New Guinea, and Torres Straits). There is perhaps a cross with Malays in New Guinea; more probably a cross with Polynesians in the Fijians. (3) Xanthochroic, or fair whites, found in the greater part of the population of Central Europe. They are of tall stature, have a colourless skin (through which the blood shows), blue eyes or grey, hair ranging from straw-colour to red or chestnut, and beard and body-hair abundant. They are both dolichocephalic and brachycephalic (short-skulled). On the S. and W. this type meets the Melanochroi, or dark whites; on the N. and E. it meets the Mongoloid. (4) The great area E. of a line drawn from Lapland to Siam is peopled chiefly by the Mongoloid, who are short, squat, with yellow-brown skin; eyes and hair black, the latter coarse, straight, long on the scalp, but scanty on the body and face. They are sometimes very brachycephalic, without prominent brow-ridges, nose flat and small, eyes oblique. The Malays proper and the indigenes of the Philippines, who are not Negritos, probably belong to this group. The Chinese and Japanese, on the other hand, are distinguished chiefly by being dolichocephalic; this characteristic occurs also in the ancient Ainos (found, for example, in Yesso), who are further remarkable for the development of hair on face and body, and the dull-red earthy skin. The Dyaks of Borneo, the Batâks of Sumatra, the Alfures of Celebes, are all dolichocephalic, and seem to pass through the people of the Pelew Islands and of the Caroline and Ladrone Archipelagos into the Polynesians, in whom the straight hair and oblique eye have disappeared, the skull being long and coming back to the Australioid type. The Polynesian type is best seen in the Maoris of New Zealand; brachycephaly occurs in the Sandwich and Samoan Islands. Language shows that Polynesia was peopled from the west, and it is thought that the Polynesian type may be a cross between the Dyak-Malay and the Negrito elements in Indo-nesia. In N.E. Asia the Tchuktchi are said to be the same as the Eskimos and Greenlanders of N. America; with Mongoloid hair and skin they have very long skulls. Dolichocephaly also distinguishes the aborigines of both Americas from the Asiatic Mongoloid; only the Patagonians and the ancient mound-builders are brachycephalic. There is the same sort of contrast and resemblance between a Mongol proper and an Iroquois as between a Malay and a Maori. The Melanochroi, mixed occasionally with Xanthochroi and Mongoloids, are to be found in W. and S. Europe, cis-Saharal Africa, Asia Minor, Syria, Arabia, Persia, and Hindustan. The type is seen in Irishmen, Welshmen, Bretons, Spaniards, S. Italians, Greeks, Armenians, Arabs, and high-caste Brahmins. In physical beauty and intellectual development they often excel the Xanthochroi, but the skin, though transparent, is brown, deepening to olive; the eyes and hair are black, the latter fine and wavy. This type shades off into the Xanthochroic and the Deccan variety of Australioid. The contrast between the uniformity of race through the various climatic zones of America and the variety of race in one zone of the Asiatic Archipelago indicates that modification by physical conditions can play only one part in the present distribution of races. It will be observed that this classification discards the old division into Aryan and Semitic—the Indo-Germanic and Syro-Arabian of Prichard—which was suggested chiefly by language, but of which even the philological boundaries are becoming indistinct. In criticism of Huxley's grouping it has been suggested that the fundamental division of the white races is not according to colour, but by a general type of physical development, which, it is alleged, would put the tall, handsome, hook-nosed Persians, the Afghans and other N.W. tribes of India, the Jews, Syrians, and N. Arabians together as the primitive and perfect white stock, degenerating by crossing into the Hindus, the short, swarthy, small-featured Arabs of Central and S. Arabia, and the mixed varieties of Europe. It has been pointed out in support of the radical difference of Mongoloid and Negroid that the former is distinguished by grave demeanour and concealment of the feelings, deliberate speech without violent gesticulation, rarity of laughter, and plaintive and melancholy songs. This is specially true of American Indians and Malays. The Negroid, on the other hand, is strongly marked by vivacity and excitability, strong exhibitions of feelings, loud and rapid speech, boisterous laughter, violent gesticulation, rude noisy music. These are certainly very fundamental mental differences, and they are seen in the Papuan of New Guinea as well as the African negro. With regard to the brown Polynesians (*e.g.*, in Tahiti), Wallace thinks that, putting mental characteristics and general physical features (except colour) together, they must be held to be fundamentally Negroid, modified towards the Mongoloid type. Since Linnæus divided the human race into *Europæus albescens*, *Americanus rubescens*, *Asiaticus fuscus*, *Africanus niger*, there have been various tests of scientific division proposed, such as Camper's *facial angle* (the angle formed by a line between the centre of the ear and the base of the nose, and a line from the most prominent part of the forehead to the most prominent part of the upper jaw-bone), which was said to increase with intellectual development; Blumenbach's *norma verticalis*, which expressed the result of several measurements of skull, frontal bones, cheekbones, jaws, and nose, and which gave the classification of Mongolian, Caucasian, Ethiopian, Malay, and American. Cuvier included Malay and American under Mongolian. Latham, the philologist, gives Mongolidæ, Atlantidæ, and Japetidæ, and maintains the European origin of the Aryan family. The *Mongolidæ* include several Indian nationalities, as the Sinhalese, Kashmiri, Tamil, and their language is stated to be for the most part in the agglutinative stage. The *Atlantidæ* include—besides the African Negroids—Syrians, Arabs, Jews, and the ancient Assyrians and Babylonians. Their language is said to be agglutinative, and very rarely inflectional. The *Japetidæ* are subdivided into Celts and Indo-Germanic, the latter into European and Iranian and some unclassed varieties; the language is described as mainly with amalgamate inflections. The question whether there was a one primitive stock of mankind, of which all existing nations and tribes are the modifications, is one which will probably never be settled. Prichard and Latham support the unity of man, the latter arguing from an assumed universal identity of language. But language might be borrowed by a distinct stock, or identities of language might be produced by different stocks exposed to similar conditions. On the other hand, language may be lost or thrown aside, and differences apparently fundamental in language (and there seem to be such) would not conflict with the supposed unity of men, were it established on appropriate evidence. But such questions are premature when existing kinds have not been accurately classified. The American school, founded by the diligent craniologist Morton, and supported by the speculation of Agassiz (that men along with animals may be arranged in certain combinations of faunæ, eight in number, and defined by geographical limits), maintain the primitive diversity of types as a doctrine. When extended observation of both physical and mental features has disclosed the facts to be explained, it will then be time to apply to these facts the hypothesis of unity or diversity.

E′thyl, a hydrocarbon radical which cannot be isolated as such, but which occurs in many compounds, of which the most important are alcohol (hydrate of E.); ether (oxide of E.); nitric ether (nitrate of E.); acetic ether (acetate of E.). When attempts are made to isolate E., it becomes doubled, forming diethyl or butane.

Eth′ylene. See OLEFIANT OIL.

Étienne, St., the capital of the department of Loire, France, on both banks of the Furens, a branch of the Loire, 35 miles S.S.W. of Lyon by railway. It has a Gothic church of St. Étienne of the 12th c., and an Hôtel de Ville, with a museum of the industrial products of the town. E. is one of the most important manufacturing places in France. The production of ribbons alone employs 40,000 workmen, and the annual value of the industry amounts to about £3,000,000. Among the other large manufactures are iron-wares (to the annual value of 4,000,000 francs), arms, steel, machinery, edge-tools, hats, and pottery. There are also large coal-pits in the vicinity, employing 5000 miners, and yielding 1,575,000 tons yearly. St. É., the *Furanum* of the Romans, was the residence of the Counts of Forez in the 10th c. As early as the 11th c. it became a centre for ironwork and ribbon-making. Pop. of municipality 128,136; of arrond. 312,826.

Etiol′ogy (Gr. *aitia*, 'a cause,' and *logos*, 'a discourse'), a term used to indicate that branch of medical science which has for its object the discovery of the causes of disease.

Etiquette′ (Fr. 'a ticket'; origin uncertain), the unwritten laws of polite society in reference to social intercourse and matters of precedency and ceremony, so called from the circumstance that formerly tickets were distributed among persons invited to processions, &c., with instructions as to the place they were to take, &c. The fallacy that E. becomes more rigorous in each ascending stratum of society is probably due to the E. of the courts of Europe having till recently choked all free and natural life. In the court of Louis XIV. of France, E. drove out sense and virtue, and spread from Versailles to the courts of Germany, where its influence was tyrannical and exacting down to our own time.

Of all European courts, that of Spain is said to be the most observant of E. In many Asiatic countries, including Turkey, court E. is very strictly enforced, while in the great African negro states no such thing as E. has ever existed.

Et′ive, Loch, an arm of the sea extending inland from the Firth of Lorn into the district of Lorn, Argyllshire, about 9 miles E., after which it stretches about 11 miles N.E., with a breadth varying from a ¼ of a mile to 2 or 3 miles. It is navigable for vessels of 100 tons. The scenery, especially in its upper part, is wildly picturesque. The ruins of Dunstaffnage Castle, originally the capital of the Dalriad kings and afterwards the stronghold of the Macdougals of Lorn, lie on the S. side, about 3 miles N. of Oban.

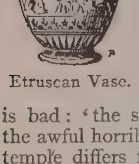
Et′na, or **Ætna** (Gr. *Aitnē*, Lat. *Ætna*, not from Gr. *aithō*, 'I burn,' but from the Phœnician *attuna*, 'a furnace,' now called in Sicily *Monte Gibello*, a term compounded of the Italian *Monte* and the Arabic *Jibel*, both signifying 'mountain'), a celebrated volcano in the E. of Sicily. It is an isolated cone, 10,840 feet above the sea-level, with a base of 90 miles in circumference, and cut off from the mountains to the N. by the valley of the Alcantara, and from the range to the S. and W. by the basin of the Semeto or Giarretta. Eastward its base reaches to the sea. Its eruptions are recorded from an early period. Thucydides mentions three which had happened since the establishment of the Greeks in the island; the second, which seems to have been of unusual violence, being referred to 475 B.C. Shortly before the Christian era successive eruptions had made the district on the E. side of E. uninhabitable and almost impassable from want of water. There were important outbursts in 1169, when lava destroyed Catania with 15,000 of its inhabitants, in 1329, 1408, 1444, 1447, 1536, and in 1669, when the lava again reached Catania. Among the last violent eruptions were those of 1852, 1865, 1868, 1874, and 1879. On the side facing the sea is a capacious amphitheatre, named the *Val del Bone*. It is 5 miles in diameter, and hemmed in by 'dykes,' of from 500 to 3000 or 4000 feet high, displaying several hundred regular strata of dark lava, alternating with beds of tufa of an average thickness of 6 feet. The surface of E. is divided into three regions—(1) The *Desert*, including the crater-bearing cone, the highest part of which is covered with snow during eight months of the year; (2) the *Woody*, richly clad with beech, pine, oak; and (3) the *Cultivated*, around the base, producing in abundance corn and wine, oil and fruits.

E'ton ('town on the water,' or 'meadow-land'), a town in Buckinghamshire, on the left bank of the Thames, opposite Windsor on the right bank, and connected with it by a fine bridge. It is 22 miles W.S.W. of London, and is near Slough. The town owes its prosperity mainly to the well-known College. Pop. reg. sub-dist. 13,820; and civ. par. (including Eton College), and ecc. par. (each) 2955.

Eton College ('the College of the Blessed Mary of Eton'), one of the first public schools of England, was founded by Henry VI. in 1440, for a provost, 10 priests, 25 poor scholars, &c. The College foundation (by recent statutes) consists of a provost, head master, lower master, 2 chaplains ('conducts'), and not less than 70 scholars—the provost of Eton and ten governors forming the 'governing body.' There are besides one vice-provost, ten fellows, one precentor, one steward of the courts, one auditor, forty-nine assistant masters, three French masters, one Italian master, and one drawing master. The buildings were commenced in 1441, and were, in part, finished and thrown open in 1443. The whole original structure was not completed till 1523. The chapel has been richly decorated, and the college hall was almost entirely rebuilt in 1858, the new features being chiefly the open timber roof with Louvre lantern, the Gothic windows filled with stained glass, and the floor of encaustic tiles. A large block of school buildings was erected (1862) at a cost of £10,000, and new mathematical schools (1876) at a cost of £15,000. The principal buildings are arranged in two quadrangles, on the N. side of which are the boys' library and apartments, called the New Buildings. The pupils, numbering 1022, consist of the 'collegers,' or scholars on the foundation, and the 'oppidans,' or students, who lodge outside the college or with the masters and fellows. There are two schools—an upper and a lower. Connected with the college are several valuable scholarships at King's College, Cambridge, obtainable by competitive examination. There are also the Newcastle scholarship, £50 for three years; two Chamberlayne (£60), one Reynolds (£59), two Davies (£60), one Berriman (£43), and one Bryant (£47), each tenable for four years; four Goodall exhibitions; two Postmasterships at Merton College, Oxford; one Rouse scholarship, one Tomline scholarship, and one Oppidan exhibition.

Eton College.

Etru'ria. The Etruscans, Ras, or Rasenas, were among the primitive inhabitants of Italy distinguished from the Iapygians in the S. of the Peninsula, and the Italians—Latins and Sabellians—who occupied the middle. It is conjectured that they originally inhabited a large district N. of the Po, between the Ligurians and the Veneti. Niebuhr supposes, from an examination of the Groeden dialect in the Tyrol, that they came from beyond the Rhætian Alps. Mantua was an Etruscan town; so were Felsina (Bologna) and Ravenna. On this side they met the Umbrians, who built Hatria and Spina ('black town' and 'thorn-town'). Their chief settlement was, however, in the district now called Tuscany. The names Umbro, Camars (Clusium), the language and religion of the Falerii in Southern E., suggest that the Etruscans pushed the Umbrians from the N., and perhaps the district of Falerii, Veii and Cære, Sutrium and Nepete, between the Ciminian forest and the Tiber, was not entered till the 2nd c. after the foundation of Rome. The boundaries of E. proper were from the Arnus on the N., by Tarquinii and Pisæ, to the Tiber; the Apennines and the sea forming the other boundaries. To the N. was a debatable land called *E. Circumpadana*, sometimes held by the Ligurians. The northern origin of the Etruscans is favoured by the fact that only one town (Populonia, not among the oldest) is on the coast. The Lydian origin suggested by Herodotus arose from the accidental resemblance of the Lydian name *Torrheboi* to the native *Tursennæ* (Gr. *Tursenoi*, Umb. *Tursci*, Roman *Tusci* or *Etrusci*). The maritime fame of E. was confused with the piratical habits of Lydia. Besides, the short sturdy figures, large heads, and thick arms on the vases and bass-reliefs of Volterra and Clusium exclude the Greek origin. Egyptian inscriptions of Menephtah and Rameses III. introduce the Turska, distinguished by their pointed helmets, along with another race, who are said to be the Pelasgi. This, however, is too vague a ground even for conjecture. The Etruscans called themselves *autochthones*, and, as Dionysius reports, 'claimed alliance with no people in the world.' As is always the case, the bass-reliefs, &c., disclose many symbolical ideas suggestive of other nations. The Persian eagle-horse, the Egyptian man-wolf, the grotesque and horrible figures resembling the Egyptian and Phœnician Kabiri, or gods of punishment, the senator's *laticlavium*, the *prætexta* and sacerdotal *apex*, the curule chairs and lictors of Rome, are all found there. In the silence of recorded history, reference (often mistaken) is made to language. But the Etruscan language, while deciphered, is not translated. By the help of a bilingual inscription at Chiusi, however, the meaning of the terminations *al* (descent from the mother) and *sa* (referring to marriage into a clan) has been reached. In the earliest inscriptions (those on clay at Cære) the collision of two consonants is avoided; later (as at Perusia) vowels were rejected, terminals were thrown off, and the language became harsh. Tarquinius becomes Tarchnaf, Minerva Menrva, Hermes Thurms, and Bacchus Fufluns. The accent was thrown on the first syllable, and the distinctions *b p*, *c g*, *d t* were lost sight of. Except *φ*, which was too soft, all the aspirate consonants were used—Thethis for Tethis. Some of the names of divinities resemble the Italian; *e.g.*, Usil (Sol) is the Sun. The gentile terminations *enas* and *ena* resemble the Sabellian clan-names. Müller thought the language was Lydian, Humboldt suggested a connection with the Basque population. No trace of it has been found in the architecture of the sepulchre-builders (*Nuraghe*) of the Tuscan Islands. Mommsen goes no further than to say that there are Aryan elements in the language. As regards the Etruscan religion, it was pervaded by a gloomy mysticism, in which soothsaying and the manipulation of numbers played a prominent part. The worship was cruel, and included the slaughter of prisoners or slaves. The interpretation of entrails, of the flight of birds, of *lightning*, and other prodigies was learned from the dwarf Tages. According to Müller, the eagle was of good omen, the owl evil; though at Athens the owl was of good omen. The system was subtle and complex. The sacred square or oblong was imitated in the shape of towns, with temples, the *vorsus* of agrarian measure, and tombs. The world was finite, its 'great year' being 6000 years; and the gods were subject to the *Dii Involuti*, the veiled deities. Among the former are Voltumna, goddess of change or fortune, and the double Janus, opening the gates of heaven and the year, turning with the sun, passing with time, flowing with rivers. His wife is sometimes Camasene, a fish; sometimes Venilia, the wave touching the shore; or Suturna, the daughter of winds and waters. An old man with wings and a hammer conducted the souls of the dead to hell to be tortured by mallets and serpents. There was a mode of redemption by sacrifice to the gods. The position of the *Dii Consentes* or *Complices* (Tina, Thurms, Sethlans or Vulcan) is not clearly defined. Nor do we know much of the patrician Lucumones, the Larths and Aruns, the eldest and second sons of the Cilnii, the Cæcinas, the Musonii, &c. As regards the early relations of E. and Rome, there is a tradition that Mezentius of Cære imposed a wine tax on Latium, and two bands of Tuscans led by Cælius Vivenna and Mastarne are said to have settled on the Cælian Hill. There was a Tuscan quarter at the foot of the Palatine. The Veientes seem often to have disputed the possession of Fidenæ. The name of the last regal family in Rome, Tarquin, is Tuscan, and so is the woman's name Tanaquil or Tancluil. But this does not imply any blending of the two races, or even a subjection of the one to the other. It was on the sea that the real power of the Tuscans lay. They were pirates, and traded as far as Miletus and Sybaris, where it is said that silver formed the medium of exchange between the *æs rude* (copper) of E. and the gold of Miletus and Carthage. Through this trade, no doubt, came many ideas which have been used to prove an Ionian origin. While the 'wild Tyrrhenian' was a pirate, peaceful trade relations seem to have existed between Southern E., or at least the town of Cære, and both Greeks and Phœnicians. The Tuscan king Arimnus presented gifts to the Olympian Zeus, and Cære had a special treasury in the temple of the Delphic Apollo. But the Etruscans dislodged the Greeks from Æthalia and Populonia, and held sway in Antium and Sunactum, making the cliff of Capri a centre for their freebooting expeditions. It is even said they founded a league of twelve towns in Campania. In 550 B.C. gold and silver coins were struck by the Etruscans after a model and standard distinctly Attic or Ionian. They had great commercial advantages; the free ports on the Adriatic, the land route from Pisæ to Spina, and the productive fields of Capua and Nola. They had the iron of Æthalia, the copper of Volaterræ and Campania, the silver of Populonia, and the amber trade from the Baltic, which came overland to the mouth of the Po. There are many Attic earthenware vases in the Etruscan tombs, and many Etruscan gold cups and bronze candlesticks at Athens. They also excelled in *terra-cotta* work, which was generally spoken of at Rome as 'Tuscanic.' Their lapidaries adhered to the form of the *scarabæus* or bettle. Tomb-painting, mirror-designing, and graving on stone were their chief forms of art. Contour-drawing in metal and monochromatic fresco-painting are both excellent. But the taste is bad: 'the severe becomes harsh, the graceful effeminate, the awful horrible, and the voluptuous obscene.' The Tuscan temple differs from the Greek types in the course of columns carried round the *cella*, or enclosed quadrangular space, and in placing a separate pedestal under each column; the outline is nearer a square; the gable is higher; the intervals between the columns, the inclination of roof, and projection of corbels are all greater. It is, in fact, more like the modern private house. About the time of the expulsion of the Tarquins, the power of the Etruscans (then in alliance with Carthage) was at its height. They had already got Corsica, and Lars Porsena, King of Clusium, by a successful war (B.C. 507) would have obtained Latium but for the intervention of the Cumæans. Rome undoubtedly fell for some time under Etrurian authority, and was forced 'to cede all her possessions on the right bank of the Tiber to the adjacent Tuscan communities, thus abandoning her exclusive command of the river; and she also delivered to the conqueror all her weapons of war, promising to make use of iron thenceforth only for the ploughshare. It seemed as if a union of Italy under Tuscan supremacy was not far distant' (Mommsen's *Römische Geschichte*, book ii. chap. iv.). The fall of Xerxes and Hamilcar was followed (B.C. 474) by Hiero's victory over the Etruscans, which is the subject of the first Pythian Ode of Pindar. The Massiliots and Syracusans then became powerful competitors in the Mediterranean. Dionysius attacked both Hatria and Pyrgi, and at last the Etruscans, abandoning Carthage, sent eighteen war-ships to the help of Agathocles. While the Romans took Fidenæ, the Samnites took Capua, thus destroying Etruscan influence in Campania. Then came the war against Veii (B.C. 396), in which Camillus inaugurated the splendid career of victory which awaited his nation. The ravages of the Celts from Gaul still further weakened the Tuscans, disconnecting their settlements on the Adriatic, and Southern E. began to enter into *civitas sine suffragio* with Rome. The reign of the Lucumones had now passed into a form of patrician government supported by priestly monopoly. The hegemony of Volsinii was merely nominal, and indeed in 301 and 260 B.C. Roman help was got to suppress popular risings. The reign of luxury and sensuality had begun. 'The Greek authors of this age are full of descriptions of the unbounded luxury of Etruscan life; poets of Lower Italy in the 5th c. of the city celebrate the Tyrrhenian wine; Timæus and Theopompus delineate pictures of Etruscan banquets, such as fall nothing short of the worst Byzantine or French demoralisation. Unattested as may be the details in these accounts, the statement at least appears to be well founded that the detestable amusement of gladiatorial combats—the gangrene of the later Rome and of the last epoch of antiquity generally—first came into vogue among the Etruscans. At any rate there is no room on the whole to doubt the deep degeneracy of the nation. It pervaded even its political condition' (Mommsen's *Römische Geschichte*, book ii.). Yet in spite of their moral decline, and in spite of the disaster at the Vadimonian Lake (B.C. 310), they were able to give succour to the Samnites in their long struggle against Rome, and they joined the Lucanians in their combination with Pyrrhus, fighting however, by Senonian Celtic mercenaries, and not by native soldiery, for the energies of the nation had been virtually broken; and one may safely say that they had lost the possibility of becoming a great nation from the day of Veii and Melpum. During the revolt of the Italian subjects the Etruscans supported Rome, as they had before supported the equites against Drusus, whose plans of reform threatened the domains of the large proprietors. They also made a struggle against Sulla. He gave much of the district to his successful legions, and this example was followed by Julius Cæsar and Augustus. E. is then lost in the Roman Empire. The question how far there was continuity of life in the Italian towns until the *Motta* was formed and the struggle against imperial power began, is one of the most difficult in history.



Etruscan Vase.

Etschmiad'sin, a fortified monastery in the Russian government of Erivan, on a tableland 20 miles N. of the town of E., ceded to Russia by Persia in 1828. Famous as the seat of the Armenian Katholikos or patriarch since 1441, and the meeting-place of the synod of the Armenian Church, it has been called the 'Rome of Armenia.' It has splendid buildings and gardens, several churches, a library (once much richer in Armenian literature than it is now), and some notable relics; among others, a bit of Noah's ark, the point of the spear which pierced the Saviour on the cross, the hands of Jacobus of Nisibis and of St. Gregory himself.

Ett'rick, a district and river in the S. of Scotland famous in Border song and story. The river, which rises in the extreme S. of Selkirkshire and flows N.E. to its junction with the Tweed, is, like its affluent the Yarrow, a 'river bare, that glides the dark hills under;' yet the pastoral solitudes through which it runs are inexpressibly beautiful. E. Forest formerly embraced the whole of Selkirkshire, and was a famous hunting-ground in the days of the Stuarts. At Tushielaw, midway up E. Vale, Adam Scot, the famous freebooter, was hanged by James V. Boston, of the *Fourfold State*, was minister of E. parish; and the poet Hogg is familiarly known as 'the E. Shepherd,' because he was born in the Forest, and spent his youth there as a shepherd.

Ett'y, William, R.A., a famous painter, was born at York, 10th March, 1787, and after seven years' apprenticeship with a printer, became in 1805 a student at the Royal Academy, London, where he had as fellow pupils Haydon, Wilkie, and Eastlake. The Academy, after repeatedly rejecting his pictures, in 1820 accepted his 'Coral Finders,' which received marked applause. In 1822 he set out for Italy, where he studied Titian, Veronese, and the other great Venetians. He was elected an Associate of the Academy in 1824, and an Academician in 1828, in which year the Royal Scottish Academy purchased his three large pictures on the history of Judith. His fame was now wide, and his works commanded high prices. Between 1811 and 1849 he produced above 200 pictures, of which the chief were 'Pandora Crowned by the Seasons,' 'The Combat,' held to be his masterpiece, 'Benaiah,' 'Ulysses and the Syrens,' 'Joan of Arc,' 'Cleopatra,' 'The Storm,' 'Lute-player,' 'Youth at the Prow and Pleasure at the Helm,' 'Amoret Chained.' He died at York, 30th November, 1849. After being unduly ignored, E. has been grossly overrated. His works are often shallow and vulgar, and his glowing nudities the result of a false ideal. 'No one,' says Ruskin, 'told E. what to paint, and he studied antique, and painted dances of nymphs in yellow shawls to the end of his days. His is gone to the grave a lost mind.' See E.'s Autobiography, and Gilchrist's *Life of E.*

Etymol'ogy (Gr. *etumos*, 'true, real,' thence *etumon*, 'the true literal sense of' and *logos*, 'a discourse') treats of the structure and history of words, and of the connections between various languages. In its widest sense it is usually termed Philology (q.v.). In a narrower but more familiar sense it denotes that branch of grammar which deals with the different parts of speech and the various modes of inflection.

Eu (Lat. *Auga* or *Aguim*), a town of France, department of Seine-Inférieure, on the Bresle, 2½ miles from its mouth and 20 E.N.E. of Dieppe. It has a fine Gothic church of the 12th c., an old church of the Jesuits containing the tombs of Catharine of Kleve and Henri of Guise, and a famous château which was begun by François of Guise in the 14th c., and which belonged to the Orleans family till 1852. The château is surrounded by a beautiful park, and contains perhaps the finest collection of historical portraits in France. E. was in the possession of the Comtes d'E., a branch of the Norman royal family, till the 12th c. The title Comte d'E. was conferred on the eldest son of the Duc de Nemours (born 1824) by his grandsire Louis Philippe. The town has some manufactures of lace, waxcloth, sailcloth, tow, hemp, linens, &c. Pop. of commune 4693.

Eubœ'a (*Egripos, Negropont*), by far the largest island of insular Greece, is situated in the Ægean Sea, and lies parallel to the mainland. The channel on the N. is called Trikeri, and on the W. Talanta and Egripos. It is only 40 yards wide at Chalcis, where it is bridged over. E. is about 90 miles long from N. to S., and its extreme breadth is 30 miles, though at one point it is not more than 4 miles across. Throughout the island runs a range of mountains, of which Mount Delphi on the eastern coast is 7266 feet high; and the south is particularly mountainous. The soil in the plains is fertile, and there are excellent pastures on the mountain slopes. Vines, corn, and olives are chiefly cultivated. Copper and iron are found in the mountains. The chief towns are Egripos or Chalcis and Karysto. In ancient times E. was divided among six or seven independent cities, of which Chalcis and Eretria were the most important. They were mostly inhabited by Ionic Greeks. For a long period the island acknowledged the supremacy of Athens, though it frequently asserted its independence. It passed successively under the sway of the Macedonians, Romans, Venetians, and Turks. It is now part of the modern kingdom of Greece. The area of E. and of the adjacent islands, the Sporades, is estimated at 2216 sq. miles; and the pop. at 103,442.

Eucalyp'tus, in botany, a genus of plants of the natural order *Myrtaceæ*, and indigenous to Australia, Tasmania, New Guinea, and some of the neighbouring islands. Of the 150 species known, most are trees, some of which attain an immense size. They are evergreen, and the leaves, which are thick and leathery, present their edges instead of their surfaces to the sun. A gum exudes from the bark after rain, whence they are known as gum-trees. They have been popularly divided into two classes, of which the one has a smooth bark, periodically shed in long strips; the other, a rough and fixed bark. The principal species are blue gum, stringy bark, red gum, and peppermint. Specimens of the two first from 300 to 400 feet high are not uncommon, while a fallen peppermint has been measured which was 480 feet long, and of proportionate girth. Their timber is hard and very durable, but heavy. The blue gum yields products which are beginning to be esteemed for their medicinal properties. A preparation made from its leaves has been pronounced by French and Italian physicians, after experiment, to be an excellent substitute for quinine. Extensive plantations of this tree exist in Algeria, Southern France, the Roman Campagna, and India, and it is also being cultivated in Brazil and California, its great rapidity of growth and the beneficial influence it exerts upon malarious places being its chief passports to favour. The health of the lepers on the 'leper island' near to Penang has much benefited since blue gums were planted beside the hospitals, and the medical officers have reported a distinct diminution in the number of fever cases among their patients. The sap from the trunk of *E. Gunnii* is brewed into a kind of beer by the colonists. Many species of E. yield an essential oil which will doubtless become commercially important. That of *E. ericifolia* resembles Cajeput. The large-fruited E. has a beautiful flower of which the stamens are brilliant with the colour of carmine. Most E. have, however, only small flowers, but those of the large-fruited E. are both large and showy.

Large-fruited Eucalyptus.

Eu'charist (Gr. from *eucharisteō*, 'I give thanks') is another name for the Lord's Supper (q.v.). The Jewish Passover, on which the E. is founded, was originally a feast of thanksgiving to the Almighty Creator for the fruits of the ground, but afterwards came to be specially associated with the deliverance from Egypt. Every master of a household who distributed bread and wine to his guests praised God who had given these fruits of the earth to man, and for the favour He had shown to his own people. For this reason the cup of wine over which he pronounced the thanksgiving was called the cup of blessing or thanksgiving. It was in allusion to this practice that St. Paul (1 Cor. x. 16) called the sacramental cup 'the cup of blessing' (Gr. *to potērion tēs eulogias*). As the Greek words *eulogia* and *eucharistia* are synonymous, the latter came to be used by metonymy for the Lord's Supper, in which 'the cup of blessing' plays such an important part.

Euc'lid of Alexandria, the world-famous geometer, lived, according to Proclus, in the time of the first Ptolemy (B.C. 323-283), and seems to have been the founder of the Alexandrian school of mathematics. His best known work is his *Elements*, a book which, in spite of its antiquity, and the rapid progress which mathematical science has undergone within the last few centuries, still retains its place, at least in Britain, as the standard authority from which the student first obtains the principles of geometry. The first Latin edition which could be called the *Elements of E.* was translated from the Arabic by Adelard in 1130. Since then there have been numerous editions. E.'s other extant works are his *Data*, his *Appearances* (of the heavens), his *Optics* and *Catoptrics*. The treatises on *Music* and the *Division of the Scale* are not certainly by him. Pappus, Proclus, Eutocius, and others also ascribe to E. works on *Conic Sections*, *Porisms*, and *Fallacies*, of which there is now no trace.

Euclid of Megara, a Greek philosopher, was one of the chief disciples of Socrates, on whose death (B.C. 399) he returned to his native city, where he became the founder of the Megaric or Dialectic school, which derives its doctrines from the Eleatics as well as from Socrates. The Megaric philosophers held that 'the good' is the leading universal in all things. Everything, they said, is good in so far as it *is*. Evil is only negation. The good is the element of agreement in all existing things. The Megaric school was also famous for its dialectical subtlety and logical puzzles.

Eudiom'eter (Gr. *eudios*, 'fine,' and *metron*, 'a measure') is an instrument employed in the analysis of gases. Many different forms of the E. are employed, but the simplest consists of a syphon tube closed at one end and graduated at the lower limb. Wires are sealed into the closed end in such a manner that they nearly touch, and an electric spark can be passed through the gases. The tube is partially filled with water to keep the gases enclosed, and the thumb is placed on the open limb to prevent their escaping when exploded.

Eudo'cia, or **Athenais,** born at Athens A.D. 394, was the daughter of Leontius, a sophist, who gave her a good education in Latin, Greek, rhetoric, astronomy, geometry, and arithmetic. She was very beautiful. Her father having left her only 100 pieces of gold, she went to Byzantium to see if the will could be reduced. Pulcheria, the sister of Theodosius II., struck by E.'s grace and culture, told the Emperor to marry the fair stranger, which he did, 7th June, 421. On the retirement of Pulcheria from public affairs, E., from 443 to 450, practically governed the empire. Before this she had suffered from her husband's unfounded jealousy of Paulinus, the *magister officiorum*. She was further suspected of having plotted with the Grand Chamberlain, Chrysaphius, the deposition of the patriarch Flavian by the second Council of Ephesus ('Council of Thieves,' 449). Having become attached to the teaching of the heretic Eutyches, she quarrelled with Pulcheria, and the result was that she withdrew to Jerusalem, where she spent her life in restoring the sacred places, and where she was finally converted by Simeon Stylites to an orthodox view of the double nature of Christ. She died in 461. E. left several poems, but the only piece extant is a poem on St. Cyprian, found in the Laurentian Library, Florence. See Gibbon's *Decl. and Fall of the Rom. Empire.*

Eudox'us of Cnidus, the astronomer, flourished in the first half of the 4th c. B.C. According to Laërtius he was for a time a pupil of Plato, but having suffered dismissal he repaired to Egypt, where he remained thirteen years. On his return he is said to have introduced the sphere into Greece. Notices of him are numerous in the poems of Aratus and the works of Hipparchus, Strabo, Seneca, Aristotle, Archimedes, Vitruvius, Proclus, Cicero, Ptolemy, &c., but all his reputed writings are lost. He is said to have corrected the length of the year, to have introduced a theory of planetary motions, and to have determined the sun's diameter as nine times that of the moon's. Delambre considers him to have been ignorant of geometry.

Eugane'an Hills, also **Monti Isolo'te** or **Padova'ni,** a volcanic range in the province of Padova, N. Italy, which rises abruptly from the 'waveless plain of Lombardy' to a height in Monte-Venda of 1884 feet, and which extends from N. to S. for a distance of 19 miles. The E. give a title to one of the most musical of Shelley's poems.

Eugène, Prince François, de Savoie-Carignan, born at Paris 18th October, 1663, entered the service of the Emperor Leopold I. in 1683. He fought with Victor Amadeus of Savoy in his campaigns in Dauphiné and elsewhere against the French. In 1697 we find him with the rank of a field-marshal inflicting the decisive defeat of Zentha (near the Theiss river in Hungary) on the Sultan Mustapha II. This was followed by the peace of Karlowitz (1699), by which Turkey ceded Transylvania to Austria, and Podolia and the Ukraine to Poland. E. was the hero of the opening scenes of the Spanish Succession War, driving back the French marshals Catinat and Villeroy in the N. of Italy. The brilliant assault on Cremona was, however, soon neutralised by Vendôme's victory of Luzzara (1702). E. now became president of the Aulic Council, and formed the league with Marlborough and Heinsius, the Grand Pensionary of Holland. The first fruit of this league was Blenheim (1704), where the army of Marsin and the Elector of Bavaria was destroyed. E. next measured strength with Vendôme at Cassano (Piedmont) without definite result. By the relief of Turin, however (where Marsin was again outgeneralled), he became master of N. Italy. After a fruitless invasion of Provence in 1707, he triumphed over Vendôme at Oudenarde (1708). Lille now fell. This victory, as well as that over Villars at Malplaquet (1709), was due to the perfect understanding between E. and Marlborough. When the latter was deprived of the command of the English army, and Anne made peace with France, E.'s glory seemed to leave him. The clever strategy of Villars disarmed Van Keppel (Lord Albemarle) and drove E. back on Brussels. Next year further reverses led to the peace of Rastadt. But fresh laurels were gained in 1716, when the Grand Vizier Ali with 150,000 Turks was routed at Petervaradein, and in 1717, when a second Turkish army was driven from the very walls of Belgrade. Only the peace of Passarowicz prevented E. from going to Constantinople. The Polish Succession War (1733) saw the veteran general once more on the Rhine, but he did not join battle with the unfortunate Berwick, whose rapid advance secured the peace of 1735. E. died at Vienna, 21st April, 1736. He was an able diplomatist and administrator. Both Napoleon and Friedrich the Great placed him in the front rank of generals. 'The bright-eyed snuffy little man' had also gentler tastes: his palace became a museum of rare books, pictures, and specimens of natural history. His soldiers loved him, as the French guard did *Le Petit Caporal*; and his figure as the 'Saviour of Christendom at the siege of Belgrade' has become classical in song.

Euge'nia, a genus of Exogenous plants belonging to the *Myrtaceæ* or myrtle order. Of this genus *E. pimenta* is the most familiar species. Its fruit is aromatic, and when dried is known as allspice, pimento, or Jamaica pepper. The flavour resembles that of cinnamon, cloves, and nutmeg. Other species are the bitter E.—which also yields pimento—the Malay apple, and *E. Jambos*; the latter affords 'clove-apples.' Other species are found in Brazil, Guiana, and the W. Indies; all of these bear edible fruit. The species of E. possess a calyx exhibiting a fourfold division, four petals, and a baccate or berry fruit consisting of one or two cells, with a seed in each cell. These plants grow in the Malay Archipelago, in the South Sea Islands, the W. Indies, Brazil, &c. A Chilian species has been acclimatized in the S. of Britain.

Eu'génie Marie de Guzman, Condesa de Téba, ex-Empress of the French, born at Granada, in Spain, 5th May, 1826, is the second daughter of the Count de Montijos and Donna Maria Manuela Kirkpatrick, whose father—connected with the old Scotch family of the Kirkpatricks of Closeburn—was for a time British consul at Malaga. She was married to the Emperor Napoleon III., 30th January, 1853. While the Second Empire lasted, E. was distinguished as the dictatress of female fashions of dress, as the graceful head of the most brilliant court in Europe, and as the chief supporter of Ultramontanism in France. A son, born 16th March, 1856, was the sole issue of this union. On the news of the surrender of Sedan, near the close of the Franco-German war (1870), E. left France for England. The Emperor joined her at Camden House, Chislehurst, where they resided till his death, 9th January, 1873. Her life here was saddened by the death of her son in South Africa, who was surprised and killed while engaged in following the war against the Zulus. Both father and son were buried at Chislehurst.

Euge'nius, the name of a Gallic teacher of rhetoric who in 392 conspired with Arbogastes to murder Valentinian and seize the imperial authority. He favoured the heathen element in the empire, and was destroyed in 394 by Theodosius. —**St. E.,** Bishop of Carthage, in the latter part of the 5th c. bravely defended the orthodox Nicean faith against Hunneric, Thrasimund, and other Arian Vandals. E. is also the name of four popes, of whom the last only, **E. IV.** (originally Gabriele Gondolmieri), is of much importance. Born at Venice in the latter part of the 14th c., he rapidly rose to be Cardinal of Bologna, and on the death of Martin V. in 1431 was chosen pope. With the help of Florence and Venice he compelled the Colonnas to restore the papal treasures they had abstracted, and then turned his attention to the refractory fathers of the council sitting at Basel (q.v.). Pressed by a democratic outbreak at Rome, E. yielded to the summons of the council to appear before it and to confirm its decrees, but in 1438 he dissolved it a second time and called a new council at Ferrara, chiefly for the Greek fathers, who proposed to unite with the Latin Church. After discussions on the simple and double procession of the Holy Ghost, purgatory, papal supremacy, the articles of union were agreed to. In the meantime the fathers at Basel had deposed him as guilty of simony, heresy, perjury, and schism. E. replied by excommunicating them all, and thus provoked the great schism, the council proceeding to elect Amadeus of Savoy as Pope Felix V. The project of Greek union was really a political measure of security against the Turks. With the same object E. urged the Hungarians into the war which ended with the disaster of Varna (1444) and the death of the brave Hunyadi. E. himself after a troubled career died at Rome 23rd February, 1447. He had distinguished men as secretaries—viz., the brothers Aretini, Poggio, and George of Trebizond. See Gibbon's *Decl. and Fall of the Rom. Emp.*, vol. xii., and authorities there cited.

Eugle'na, a microscopic organism occurring in infusions of decayed organic matter, and generally believed by naturalists to be an infusorian animalcule. Some authorities consider it to be a lower plant-form. The body is provided with a single lash-like filament or *flagellum* used for locomotion, and a pigment spot is also developed in the body. The E. may be coloured green with the same substance (*chlorophyll*) which imparts the green colour to plants. The Green E. is a familiar species.

Eu'gubine Tables (*Tabulæ Eugubinæ*), the name given to the famous bronze tablets found in 1444 in a subterranean vault near the site of the ancient Eugubium or Iguvium (*Gubbio*). They were originally nine in number, but in 1540 two were conveyed to Venice and never recovered. The remaining seven are preserved in Gubbio. On four the *characters* are Umbrian (which do not greatly differ from the Etruscan), on two Latin, on one partly Latin partly Umbrian. The *language*, however, which is undoubtedly the ancient Umbrian, is the same in all, and is quite distinct from both Etruscan and Latin, though exhibiting an affinity to the Latin in its older forms, and also to the Oscan. The four in Umbrian characters are earlier than the others, and are supposed to belong to the 4th c. B.C. All contain directions for sacrificial and other rites.

Eu'lenspiegel ('Owlglass') **Tyll,** the hero of a great number of German popular stories, who, as a wandering journeyman, travels over the country, indulging, under the guise of a simpleton, in knavish tricks and wild frolics. E. is most probably an imaginary character, but some assert that he was born at Kneitingen, Brunswick, that he roved through the N. of Germany, visited Rome and Poland, finally settled at Mölln, near Lübeck, and died there in 1350. A tombstone is shown at Mölln, with a looking-glass (*spiegel*) and an owl (*eule*) on it; but Damme, in Belgium, also claims to be the place where E. was buried. It is not known when or in what dialect the jocose tales in which E. figures were first written. Most probably they were composed in Low German, and from this were translated into High German by the Franciscan Thomas Murner, who collected and edited them in 1519. There is a later edition by Lappenberg in 1859. The stories have been popular not only in Germany but in other parts of Europe, and have been translated into French, English, Latin, Dutch, Danish, and Polish.

Eu'ler, Leonhard, one of the greatest mathematicians of last century, was born at Basel, 15th April, 1707. In 1727 he accompanied the Bernoullis to St. Petersburg, where on the retirement of Daniel Bernoulli he became professor of mathematics in the Academy of Sciences, then rapidly rising to a high position under the rule of Peter I. Here he published his *Mechanica Analytice Exposita* (1736), his *Tentamen Novæ Theoriæ Musicæ* (1739), besides numerous papers in the *Petersburg Memoirs;* among others those on isoperimetrical problems, which may be looked upon as anticipating the calculus of variations developed by Lagrange fifteen years later. In 1741 he went to Berlin, on the invitation of Friedrich the Great, to assist in forming an academy there. Between 1744 and 1773 he published several scientific works and tables. In 1766 he returned to St. Petersburg. Latterly he lost his eyesight, but his labours were still continued by the aid of an amanuensis. E. died 7th September, 1783, while playing with his grandchild. Of his numerous works and memoirs many remain unpublished.

Eumen'ides (Gr. the 'well-disposed' or 'gracious' goddesses), a euphemism by which the Greeks designated certain dreadful powers whose real name they feared to utter. By a similar euphemism the Athenians called them *semnai thei*, the 'venerable goddesses.' They were called also by the Greeks *Erinnues* (Gr. *ereunaō*, 'I search after, track, persecute,' or *erinuō*, 'I am angry'), and by the Romans *Furiæ* or *Diræ*. They were more ancient than the Olympian gods, and dwelt in the thick darkness of the nether world. Homer, Hesiod, and the tragedians do not specify their number, but later writers restrict it to three. Their names are Alecto, Megæra, and Tisiphone. Their genealogy is variously given. Hesiod calls them the daughters of Ge by the blood of Uranus, Æschylus of Night, Sophocles of Darkness, others of Chaos and Terra. Stern and inexorable, they executed the vengeance of the gods, and punished the guilty here and hereafter. They are described by Æschylus as of grim and frightful aspect, with dark and gory garments, serpent-twined locks, and blood-dripping eyes. Later poets represent them with wings, holding in one hand a burning torch, in the other a whip of scorpions, and attended by Terror, Rage, Pallor, and Death. In works of art they appear as grave and serious maidens, richly attired, but still retaining the serpents and the torches. They were propitiated by offerings of black victims and libations composed of water, milk, and honey (*nēphalia meiligmata*). The white turtle-dove and the narcissus were sacred to them. In their festival (*Eume-*

nideia) only freeborn citizens of virtuous life were allowed to take part.

Eumol'pus (Gr. 'sweetly singing'), a mythic bard and priest of Demeter, concerning whom there were numerous traditions. He is represented as the son of Poseidon and Chione. He was educated in Ethiopia, fled to Thracia, and subsequently aided the Eleusinians in a war with Athens, when he was slain by Erechtheus. E. introduced into Attica the Eleusinian mysteries and the cultivation of the vine. The Eumolpidæ, a sacerdotal family at Athens, derived their name from him.

Eu'nice, a large genus of Errantia (q.v.) or marine worms, the species of which live in the sand of our own and other coasts. One of the largest is the giant E., measuring 4 feet or more. These worms possess prominent side bristles or *setæ*, and the mouth is provided with a protrusible proboscis, armed with several pairs of horny jaws. The gills or branchiæ are large.

Euno'mius, the son of a peasant of Cappadocia, was ordained Bishop of Cyzicum in 360. On account of his intense zeal for Arianism he was soon after deposed and banished. After many vicissitudes he was allowed to return to his birthplace, where he died about 394. In the great doctrinal controversy in the 4th c. the orthodox Church party held the Son to be of the same substance with the Father (Gr. *homo-ousios*), in opposition to the Arians, who regarded him as only the highest of the *creatures*. The great majority of the heterodox, however, belonged to a middle or semi-Arian party, who adopted the phrase *homoiousios* ('of a similar substance') to express their idea of the relation of the Son to the Father. E. took up his position at the farthest extremity of the heterodox and became the leader of the ultra-Arians, so that these were known as the Eunomian party. The Son, according to him, was the first of created beings, and the Spirit the first among the created natures, formed according to the command of the Father by the agency of the Son.

Euom'phalos, a fossil genus of Gasteropodous mollusca, found in early Palæozoic strata, and dying out in the Trias. The shell is of discoidal form, the whorls being angular, the aperture five-sided, and the umbilicus or opening of the central spine or columella of large size. A large number of species are known.

Eupato'ria (formerly *Koslov*), a town and port in the government of Taurida, Russia, on W. coast of the Crimea. It has a fine mosque, several manufactories, and important fisheries. It exports about £45,000 worth of hides, barley, wheat, &c., yearly. During the Crimean war the Allies selected E. as a landing-place for their troops. It was the headquarters of the Turks in 1854-55. Here, under Omar Pacha, they repulsed an attack of the Russians, 17th February, 1855. Pop. 8960, mostly Tartars. About 12 miles distant is the large salt lake of Ssak.

Eupato'rium, a genus of Exogenous plants included in the order *Compositæ*. They have small flower-heads or *capitula* arranged in corymbs. The florets or separate flowers of the heads are tubular, each containing stamens and pistil. The receptacle is naked, and the stigmas or heads of the carpels (pistil) are club-shaped. These plants mostly inhabit the New World. The British species is the hemp agrimony, which is found in marshy districts. Its root and leaves were held in repute medicinally. A common American species is the thorough-wort, which is highly valued as an antiperiodic in intermittent fevers, such as ague, &c. It has a diaphoretic and purgative action. A species of N. America obtains the name of *gravel-root*, as being used as a preventive of 'gravel.' Another species, esteemed as a remedy for snake-bite, is found in N. Brazil and the E. Indies.

Eu'pen (called by the French *Neau*), a town in the province of Rheinland, Prussia, on the railway to Aachen, and 9 miles S. of that city. It has several churches, a Franciscan monastery, and an orphanage. E. is the seat of the most important cloth manufactures in Prussia. It has also manufactures of waxcloths, waxlights, and leather. There are, besides, machine and dye works. At the peace of 1814 E., with the other portions of the duchy of Limburg, was assigned to Prussia. Pop. town 29,328; district 42,431.

Eu'phemism (Gr. *eu*, 'well,' and *phēmi*, 'I speak'), is the substitution of an indirect or delicate form of expression in order to avoid one that is unpleasant or offensive. Thus for 'he died,' we say 'he fell asleep,' 'he paid the debt of nature,' 'he was gathered to his fathers.' The ancients always had recourse to the E. to avoid expressions of evil omen—*e.g.*, they called the Furies *Eumenides*—a name of blessing for one of cursing.

Eu'phon, a musical instrument, similar in tone to a glass harmonicon, invented by Chladni.

Eupho'nium, a bass instrument of the Bugle (q.v.) class, used in brass bands.

Euphorbia'ceæ, a natural order of Exogenous plants, popularly named the 'spurge order,' from its including the *Euphorbiæ* or spurges and allied plants. It is a very large natural group, the species of which occur in both hemispheres. They are most numerous in tropical and sub-tropical regions. In Britain there are three genera (including at least fifteen species) of this order. The E. exist as trees, shrubs, and herbs, with opposite or alternate stipulate leaves. They have unisexual flowers, which occasionally possess one floral envelope only. The stamens are sometimes numerous, and united into one or more bundles. The ovary has one, two, three, or more cells, and the seeds are albuminous. The spurges yield a milky juice, used by African savages as a poison for arrows. The *latex* or juice of *Siphonia Braziliensis* of Brazil affords a superior Caoutchouc (q.v.), which escapes from incisions made in the bark, and is allowed to dry on clay moulds. So many as 140,762 cwts. (valued at £2,020,799) were imported into Britain in 1894. Cassava is obtained from a species of the genus *Manihot*. In this order are also included the *Ricinus communis*, the castor-oil plant, and *Croton tiglium*, which furnishes croton oil. The boxwood of engravers is obtained from the evergreen Box, another genus of E.; and *Oldfieldia Africana* yields African oak or teak.

African Euphorbium.

Euphor'bium, the type-genus of the spurge order of plants, *Euphorbiaceæ* (q.v.). It has achlamydeous ('single-enveloped') monœcious flowers, and the various species yield a milky juice often of poisonous nature. One species, the caper-spurge, affords an oil which has a powerfully purgative action; *E. officinarum*, *E. antiquorum*, and *E. Canariensis*, yield a purgative resin named *E.*; and *E. ipecacuanha* furnishes an emetic which is not to be confounded with the true Ipecacuanha (q.v.). Many of the euphorbia closely resemble the cactuses (see CACTACEÆ) in appearance. Some have scarlet and showy involucres surrounding their flowers, and some form spiny and dense hedges in Africa.

Euphra'sia. See EYE-BRIGHT.

Euphra'tes (Arab. *Frat*, the 'fruitful'), the largest river of Western Asia, rises in the Armenian highlands (*Anti-Taurus*) by two branches, the Murad and Kara Su, which unite 10 miles N. of Keban' Ma'den, about lat. 39° N. and long. 39° E. The stream thus formed flows W., dividing Armenia from Cappadocia, forces its way through the Taurus, and on reaching the plain country winds S. and S.E., passes the N. of Syria and N.E. of Arabia Deserta, and eventually, after many deviations, joins the Tigris, to terminate in the Persian Gulf. Its total length is 1750 miles, of which 1195 are navigable, while the area of its drainage is 255,000 sq. miles. The tributaries are few and of no great size, the largest being the Chabur or Khabur. Among the towns washed by the E. are Bir, Deir, Anah, Hit, the ruined Babylon, Hillah, Lamlun, and Kurna. The last of these is at the confluence of the E. and Tigris. Below this point the stream is called the Shat-el-Arab, and is 900 yards wide, from three to five fathoms deep, and 92 long. Bassorah is on the Shat-el-Arab, which enters the sea by three channels, after receiving the Kerchu or Kerkhah and Kuren or Karan from Persia. Above Hit the river is singularly picturesque; along the banks are many ancient aqueducts for irrigation. From Hit to Babylon the country is flat, and is partly cultivated by Arabs, whose villages, shaded by the date-tree, are dotted along the banks. Irrigating canals and cuts are frequent above the Lamlun marshes, which are flooded yearly, and which yield rich crops of grain and rice. Here the mud villages are annually swept away. The river is fringed with a continuous belt of fine date-trees from Lamlun to the sea. The water of the E. is turbid, but when purified is sweet and wholesome. The river is at flood-tide in May, and at full ebb in November. In its latter state it is tranquil and sluggish, but when swollen it flows swiftly. It abounds in fish. From the earliest times it was used for navigation, and in the 15th c. it was the highway for European merchants to India.

Euphros′yne (Gr. 'mirth') was one of the three Graces, who presided at festive meetings.

Eu′phuism, the name of a literary style made fashionable in England by the *Euphues* (1580) of John Lyly. It was partly a growth of the Renaissance, being prevalent in France and Italy, and was marked by far-fetched illustrations, an abundance of classic allusions, flowery antithetic language, and extravagant hyperboles. It was ridiculed in Shakespeare's *Love's Labour's Lost*, and by Ben Jonson in *Asotus* in *Cynthia's Revels*. See articles LYLY and ENGLISH and FRENCH LITERATURE.

Euplectell′a, the name given to an elegant and beautiful genus of siliceous or flinty sponges abundant at the Philippine Islands. The species of E. are known as 'Venus' flower-baskets,' the outward appearance of these organisms suggesting the form and shape of an elegant vase of from 8 to 10 inches in length, the sides of the vase being formed of a delicate network of siliceous or flinty fibres, whilst the lower part of the organism is provided with longer fibres serving to attach it to the sea-bed, and which resemble spun glass in appearance. *E. aspergillus* is the familiar species, whilst another species, *E. suberea*, was obtained in the dredge by the *Challenger* expedition. See also SPONGE.

Eu′poda, a family of *Coleoptera* (q.v.) or Beetles, belonging to the section *Tetramera*, including those with four joints in the tarsus. The segment of the limb named the 'thigh' by entomologists is usually very long in this group, which is represented by a few British and many exotic species.

Eure, a department of France, and part of the old province of Normandy, is bounded N. by Seine-Inférieure and the estuary of the Seine, E. by Oise and Seine-et-Oise, S. by Eure-et-Loir, and W. by Calvados and Orne. Area, 2300 sq. miles; pop. 349,471, showing a decrease of 9358 since 1886. It is very flat and woody, and is watered by the Seine, Eure, Iton, Risle, and Charentonne. The soil is a fertile alluvium, except along the Seine, where it is in part sterile and sandy. Besides grain, hemp, and flax, E. yields large quantities of apples and pears, of which are made excellent cider and perry. The breeding of horses, cattle, and sheep is largely carried on, and there are important manufactures of woollens, paper, glass, copper-ware, &c. E. is traversed by several lines of railway. Évreux is the capital, and among the other towns are Pont-Audemer, Louviers, Les Andelys, and Bernay. The *river* E. rises in the W. of Orne, flows S.E. into the heart of Eure-et-Loir, winds abruptly N. through Eure, and enters the Seine near Pont-de-l'Arche after a course of 100 miles.

Eure-et-Loir, a department in the N.W. of France, bounded N. by Eure, E. by Seine-et-Oise and Loiret, S. by Loir-et-Cher, and W. by Sarthe and Orne. Area, 2268 sq. miles; pop. 284,683. It is traversed from E. to W. by the Plateau de la Beauce, separating the basins of the Seine and the Loire, and is watered by the Eure in the N., and the Loir and its affluent the Huisne in the S. The low country (La Beauce) is level, and produces excellent wheat, hops, &c., while the elevated region *du Perche* is intersected by rich valleys and covered with oak and birch forests. E.-et-L. produces good cavalry horses (*chevaux du Perche*). The value of the annual yield of grain, fruit and vegetables amounts to 18,500,000 francs. The chief railway in E.-et-L. is the Paris à Brest. The capital is Chartres, and other important towns are Châteaudun, Dreux, and Nogent-le-Rotrou.

Eurip′ides, the latest in order and the least in fame of the three great tragic poets of Greece, was born at Salamis, B.C. 480. His parents were persons of rank and wealth. In early life he was a painter, and received a complete philosophical education, Prodicus having been his instructor in rhetoric, and Anaxagoras in physics; and he was the friend, if not the pupil, of Socrates. At an early age he devoted himself to tragic poetry, having exhibited the *Peliades* in his own name when twenty-five years old, but did not succeed in gaining a prize till 441 B.C. His attachment to the new philosophy and to the sophistical education of the time drew upon him the splendid slanders of Aristophanes, and the populace of Athens only granted him the prize five times out of seventy-five. In 408 B.C., E. sought refuge from the party violence of the Athenians at the court of Archelaus, king of Macedonia. It is said that he was there torn in pieces by hounds let loose upon him by two poets, Archidæus and Cratinus, whose enmity he had excited. He died at the age of seventy-four (406), and was buried at Pella. The dramas of E. are said by some to have been seventy-five, and by others ninety-two, in number. Of these, eighteen have come down to us, of which the following is a list, with the dates of their representations:—*Alcestis*, B.C. 438; *Medea*, 431; *Hippolytus*, 428; *Hecuba*, 424; *Heracleidæ*, 421; *Supplices*, *Ion*, *Hercules Furens*, *Andromache*, *Iphigeneia in Tauri* (dates uncertain); *Troades*, 415; *Electra* (about) 415; *Helena*, *Iphigeneia in Aulide*, *Bacchæ*, *Phœnissæ*, *Cyclops* (dates uncertain); *Orestes*, 408. In tragic power the *Medea* excels all the other dramas. The *Cyclops* is the only example of the ancient satiric drama now extant. In regard to the structure of his plays, E. has been severely criticized for his use of the prologue, so thoroughly undramatic in its character; and for the frequency with which the difficulties of his plots are solved by the intervention of a deity. Mrs. Browning has applied to E. the epithet 'human,' in recognition of 'his touches of things common, till they rise to touch the spheres.' Sophocles, it was said, represented men as they ought to be, E. as they really are. From the supernatural in Æschylus and the heroic in Sophocles the Greek drama passes in E. to 'the romance of everyday life, the unexaggerated picture of manners in which the human heart, and the affections which influence it in its domestic relations, constitute the leading subject.' He delights in the 'nice disdinctions of a sophistical philosophy, in brilliant antitheses, startling paradoxes, a dexterous use of language, and an affectation of pedantic ornament.' The ancient authorities regarding E. are the biographies in Suidas; in Musgrave's edition, by Thomas Magister; in Elmsley's edition of the *Bacchæ*, first published in 1821; and Aulus Gellius, xv. 20. The chief modern editions of the whole works are those of Barnes (1694), Musgrave (1778), Matthiæ (1813), Paley (1858), Kirchhoff (Berl. 1855), and Nauck (Leipz. 1857-69). There is an English translation in verse by Potter (Oxford, 1814).

Euro′pa is the ancient name of the continent of Europe. It is commonly supposed to have been derived from E., the daughter of Agenor, king of Phœnicia, but Hermann has plausibly suggested its derivation from two Greek words, meaning the 'broad land.' The E. of the ancients at no time equalled in extent the modern continent. The primitive E. of Homer was comprised within very narrow dimensions, and at its greatest size the E. of the Greeks was bounded by the chain of mountains N. of Thrace, Italy, and Iberia, and did not comprehend more than a third of modern Europe. The geographical knowledge of Southern E. was obtained by the successive victories of the Roman arms, especially by the Gallic campaigns of Cæsar. The traders who followed the advancing legions of the Empire penetrated beyond the Elbe, the Weser, and the Vistula, but the conquerors possessed little, if any, knowledge of the races who roamed through the remoter regions of the N. Subsequent additions to the geography of E. are chiefly due to the Scandinavian pirates, to the Christian missionaries who explored Scythia and Sarmatia, and to Karl the Great, Ælfred the Great, and the Teutonic knights, by whom, in the annexation of Prussia, the long series of geographical discoveries was completed.

Eu'rope is the smallest of the three great divisions of the Old World, and is strictly a western prolongation of the continent of Asia. In proportion to its size it is by far the most populous of the great land divisions, while it is also the centre of culture, industry, and commerce. It is bounded N. by the Arctic Ocean, W. by the Atlantic, S. by the Mediterranean Sea, the Sea of Marmora, the Black Sea, and the Caucasus, and E. by the Caspian Sea, the river Ural, and the Ural mountains. The extreme length, from Cape Roca (Portugal), in long. 9° 30′ W., to the Ural Mountains, 60° 20′ E., is 3400 miles; the breadth, from Cape Tarifa (Spain), in lat. 36° N., to Cape Nordkyn (Norway), 71° 5′ N., is 2760. But if we include insular E. the area is considerably wider. The chief projections of the coast are Scandinavia, Jutland, Brittany, the Iberian peninsula (Spain and Portugal), Italy, the Hellenic peninsula, and the Crimea in the Black Sea. Owing to the numerous indentations, of which the principal are the White Sea, the Baltic, the Bay of Biscay, and the Adriatic, the coast-line is comparatively longer than that of any other great division of the globe, having an estimated length of 19,500 miles, or 1 linear mile to every 194 sq. miles of surface. The political divisions, with areas and populations, are as follow:—

States.	Area in sq. miles.	Population.
Russia (with Poland)	2,095,504	99,553,024
Germany	208,670	49,428,470
Austria-Hungary (including Bosnia and Herzegovina)	261,119	42,813,251
France	204,092	38,343,192
Great Britain and Ireland	120,979	38,104,975
Italy	110,623	28,459,628
Spain	197,670	17,673,838
Sweden and Norway	297,321	6,785,898
Belgium	11,373	6,262,272
Roumania	48,307	5,800,000
Portugal	34,038	5,062,719
Turkey	61,200	4,781,545
Netherlands	12,648	4,732,911
Bulgaria and E. Roumelia	37,860	3,309,816
Switzerland	15,976	2,917,754
Servia	19,050	2,256,084
Greece	25,041	2,187,208
Denmark	15,288·7	2,185,162
Luxemburg	998	211,088
Montenegro	3,630	199,040
Samos	180	48,666
Monaco	8	13,304
Liechtenstein	68	9,124
San Marino	32	8,260
Andorra	175	6,180
Total	3,781,850·7	361,153,409

Belgium is by far the most densely-peopled country, having in 1893 550·6 inhabitants to the sq. mile; Russia is among the least populous, with an average of some 47. Great Britain, Germany, France, Austria, Russia, and Italy are known politically as 'the six great powers.' Eleven of the European states have possessions in other divisions of the world, the aggregate area of which amounts to nearly five times as much as that of all E.

Physical Aspect.—The surface of E. consists of two large unequal portions of distinctly marked character. North-eastern E. is a plain 2,500,000 sq. miles in extent, and of great uniformity, while South-western E. is a tableland traversed by high mountains, and intersected by considerable plains and valleys. The great north-eastern plain extends from the Black Sea and the Caucasus N. to the Arctic Ocean, and from the Ural Mountains W. to the low shores of Holland and Hanover. Of plateaux the chief are those of Bavaria in Germany, Bohemia in Austria, Castile in Spain, and Auvergne in France. The *mountains* of Southern Europe, forming a great girdle, may be said to centre in the system of the Alps (q.v.), which reaches a height of 15,783 feet in Mont Blanc. Hence radiate the German Mittelgebirge, with their highest point of 5000 feet in the Riesengebirge; to the E. the Carpathians, enclosing in a vast crescent the entire W. plain of Hungary; to the S. and S.E. the ranges of Italy, Turkey, and Greece. The mountains of Spain, including the Pyrenees, are also linked to the Alpine system by the Cevennes and other chains of France. The Ural Mountains, the Caucasus, the table-topped mountains of Norway, and those of Britain, are isolated masses. Mount Elbruz, in the Caucasus (18,493 feet), is the loftiest peak on the borders of E. The higher European ranges are covered with perennial snow, and send down enormous glaciers. Volcanoes are comparatively numerous, the most notable being Vesuvius in Naples, Ætna in Sicily, Hecla in Iceland, and those in the Lipari Isles. There are also many extinct volcanoes in Catalonia, the mountains of Auvergne, and in S. Germany. The *rivers* of E. are smaller than those of America and Asia, but are admirably distributed for purposes of fertilisation and commerce. They may be grouped into two systems, one flowing in a direction generally N. or W., the other S. or E. The latter includes the largest rivers, as the Volga (2400 miles), Danube, Dnieper, Dniester, Don, Po, Rhône, Ebro, &c.; the former has the Tagus, Garonne, Loire, Seine, Rhine, Weser, Elbe; the Oder, Vistula, Düna, Tornea, &c., entering the Baltic; the Onega, Dwina, Mezen, and Petchora flowing into the Arctic Sea. Most of these are navigable, and conduce greatly to the development of commerce in the inland countries. The *lakes* of E. are only inferior in extent and number to those of N. America. They are chiefly grouped round the E. coast of the Baltic and among the Alps. In Finland are lakes Ladoga and Onega, by far the largest sheets of fresh water in E.: those of Switzerland and Italy are famous for their beauty.

Islands.—The aggregate area of the islands is about 191,000 sq. miles, or one-twentieth of all Europe. Proceeding from the N., the principal are Novaia Zemlia, Spitzbergen, the Lofodens, Iceland, the Faröe Isles, the British Isles, Heligoland in the N. Sea; the Danish Isles, Bornholm, Rügen, Gotland, Oeland, Dago, Osel, and Aland Islands in the Baltic; the Balearic Islands, Sardinia, Corsica, Sicily, Pantellaria, Gozo, Malta, Crete, the Ionian Isles, Strivali Isles, Cerigo, and the Grecian Archipelago in the Mediterranean. E. is generally regarded as including the Azores and Madeira.

Climate.—E. is the only great division of the globe which nowhere touches the torrid zone, and is almost wholly within the temperate. The climate is partly continental and partly oceanic, and is throughout greatly more temperate than other countries of equal latitude. Britain and France are on the parallel of Labrador, and the line of 41° F. annua lmean temperature, which leaves America from the State of Maine in lat. 45°, is carried N. to beyond lat. 60° on the coasts of Norway. The extremes of mean temperature are 58° and 106° F. In the N.E. the air is dry, and the sky clear; in the S. and S.W., where the climate is milder and more oceanic, the air is humid and the rains heavier. The Scandinavian

mountains shelter the countries of the Baltic from the cold winds of the N., while the Alps and Apennines arrest the Sirocco from the S. The heaviest rains fall on the western shores, where the S.W. rain-clouds of the Atlantic deposit their loads of moisture. On the coast of Portugal the yearly rainfall, the heaviest in E., amounts to 118 inches; at the foot of the Alps it is 100; on the W. shores of Britain 35-100; and on those of Norway 32. Ireland has no fewer than 208 days in the year during which rain falls. On the other hand, the fall in the Russian plains is only some 15 inches, and there are not more than half the average of rainy days that occur in the W. The fall of snow depends on temperature, and increases from S. to N. There are on an average 1½ day annually at Rome, 10 days at Milan, 12 at Paris, 21 at Karlsruhe, 30 at Copenhagen, and 171 at St. Petersburg.

Geology and Mineralogy.—The geological formations of E. indicate that the S. and central part of the continent remained submerged under the ocean for ages after the northern portion existed as dry land, and that the Caspian, the Black Sea, and the Arctic Ocean were united in comparatively recent times. The great mountain ranges and Scandinavia, Bohemia, Auvergne, Normandy, and parts of Britain, consist of gneiss, granite, syenite, &c., and the highly-contorted strata of the older Palæozoic formations. The Old Red Sandstone or Devonian occupies vast tracts in Russia, the Rhine basin, and Britain, and crops up continually, like the other primary groups, on the flanks of the southern mountains. The secondary formations occur in England, Denmark, France, W. Germany, Turkey, Greece, the S.E. and N.E. of Russia, and in patches in Spain and Italy. Tertiary strata stretch, with few interruptions, in a broad zone from the S. of the Baltic to the Black Sea, extending in breadth from the Niemen to the Carpathians. To the W. and S. of this belt they cover the basins of all the great rivers, including those of the Danube, Seine, and Thames. The minerals of E. are mainly useful, and are distributed in great abundance. Gold is produced in greatest quantity in the Carpathians and Urals; silver in the Erzgebirge, Harz, Carpathians, and in Scandinavia. The richest iron-mines are those of Britain, France, the Eastern Alps, the Riesengebirge, and the Scandinavian Alps. Lead is plentifully found in the Sierra Nevada, Cornwall, Saxony, and Bohemia; tin in Cornwall; zinc in the Riesengebirge; mercury at Almaden in Spain, and at Idria in Carniola; copper in the Carpathians, Urals, Pyrenees, and in Cornwall and Norway; cobalt, bismuth, and antimony in various parts of Germany. In the Russian government of Perm are found diamonds; the opal in Hungary, and rubies in France. Coal is generally most abundant where iron is found, but especially in Britain, Belgium, and France. Salt-mines are numerous in the Carpathians and Alps, and sea-salt is obtained extensively on the coasts of the Black Sea, &c. In the volcanic regions, as the Solfataras of Naples, Sicily and Iceland, there is much sulphur, and petroleum occurs in Russia, Wallachia, Italy, and Wales. Amber is procured chiefly on the Prussian shores of the Baltic. Mineral and brine springs are of frequent occurrence, and large naphtha springs are in Russia.

Botany.—The flora of E. does not probably contain a single indigenous plant unknown in Western Asia or Northern Africa. It is naturally divided into four great zones:—(1) To the N. of lat. 64°, including Iceland and part of Russia and Scandinavia, is the region of mosses and saxifrages, which has only stunted birches and firs, and along its southern limit some oats, rye, and barley. (2) The N. middle zone, extending from Scandinavia to the N. of France, also known as the region of the *Umbelliferæ*, the predominant trees of which belong to the *Coniferæ* and *Amentaceæ*, as the beech, oak, birch, plane, alder, poplar, willow, and cypress. The pastures are singularly fine, and the forest trees shed their foliage in winter. Besides the species of grain found in the northern zone, there are here wheat, hemp, flax, leguminous plants, apples, pears, cherries, and other northern fruits. (3) The S. middle zone, or region of the central mountain system, where the plains are clad with oaks, beeches, and chestnuts, and the elevations with pines. Here are produced much wheat and wine. (4) The southern or evergreen zone, the region of the *Labiatæ* and *Caryophyllæ*, embracing the three southern peninsulas and the S. coast of France. The vegetation of this zone is famous—its olives and date-palms, its winter flora and its fiery wines. In the extreme S. the orange flourishes, and rice is cultivated in E. Spain and N. Italy. Among the rare fruits are the fig, almond, lemon, pomegranate and citron. On the other hand, the pastures, which are interspersed with copse of the heath tribe, are less luxuriant than those to the N. of the Alps.

Zoology.—The fauna is on the whole less varied than that of the other divisions of the Old World, but is peculiarly exempt from noxious species. The chief rapacious animals—most abundant in Scandinavia and Western E.—are the bear, wolf, wild boar, and lynx; vast forms are now wholly awanting, while there are but few reptiles. Domestic animals, however, are plentiful almost everywhere. The buffalo feeds in the marshes of Hungary, Wallachia, and Italy; the reindeer is peculiar to the far North, and the camel thrives near the Black Sea. Many of the quadrupeds yield rich furs. The Barbary ape occurs at Gibraltar. In the Pyrenees and higher Alps are found the chamois, wild goat, and eagle. Among the commoner birds of prey are the vulture, falcon, and kite. The birds are inferior to those of other divisions in size and brilliancy of plumage, but are unexcelled for their sweetness of voice. The northern seas, lakes, and rivers surpass those of the S. in abundance of fish, chief of which are the cod, salmon, mackerel, and herring. Northern E. has a greater number of species of animals; the S. is more abundant in individuals.

Ethnology and Language.—The vast majority of Europeans belong to the Aryan (q.v.) family; only about one-nineteenth are Turanian. The former is distinctly divisible into four great groups—the Celtic in the W., the Greco-Romanic in the S., the Teutonic in the centre, and the Slavonic in the E. Of the Aryan groups, however, the Celt has in many cases failed to retain his original tongue, and therefore linguistically there are now only *three* large divisions of the population—the Teutonic, the Greco-Romanic, and the Slavonic. The first of these, numbering some 113⅔ millions, mainly embraces the Germans, Scandinavians, and English. Constituting the Greco-Romanic there are—(1) the Italic (101½ millions), comprising Italians, Spanish, Portuguese, French, Provençal, Walloons, Rhætians (Ladins), Rumans (Wallachians); (2) the Greeks, numbering some 5⅔ millions. The Slavs are 121⅓ millions in all, and are divided into E. Slavs—Russians, Cossacks; S. Slavs—Servians, Bosnians, Croatians, Bulgarians, Dalmatians, and Slovens; W. Slavs—Poles, Czechs, Slovachs, Wends, Sorbens. Celtic dialects are now spoken only in the Highlands of Scotland, Wales, Ireland, and Bretagne. The principal Turanian inhabitants of E. are the Turks (1¾ million), the Finns (3 millions, including the Esthonians, Livonians, Lapps, and Samoyedes), the Calmucks of Russia, the Magyars of Hungary (8½ millions), and probably the Basques of Spain. Gipsies are scattered in large numbers over E., while there are also some 7⅕ millions of Jews. In all, some sixty separate peoples, speaking fifty-three different languages, have been enumerated.

Religions.—All the *nations* of E. are Christian, excepting the Turks, who are Mohammedan. Christianity is split into three main divisions—the Roman Catholic, the Greek, and the Protestant Churches. The Catholic Church has the greatest number of adherents (155 millions), embracing the majority of the Greco-Romanic nations, about one-half of the Germanic, as well as a large proportion of the Slavs and Celts. Protestantism prevails in Britain, the Netherlands, Prussia, Denmark, Sweden, and Norway. The Greek form of religion is professed in Russia, Greece, and parts of Turkey and Austria. There are 85½ millions of Protestants and 90½ millions members of the Greek Church. The Mohammedans number 2 millions and the Jews 7⅕ millions, while there are also in the N. idolatrous Laps and Finns.

For the history of the continent see GREECE, ROME, and the various modern countries of E.

Euro'tas, the classic name of the modern Iris or Vasilo, a famous river of Greece, which flows through the ancient

Laconia, down a beautiful vale with dark gorges and through a fertile plain into the Gulf of Kolokythia, the ancient *Laconicus Sinus.* Sparta stood upon the right bank of the E., near its confluence with its only important tributary, the Œnus.

Eury'ale, a genus of waterlilies (*Nymphaceæ*), of which *E. ferox* of China and India is a familiar example, the seeds of this species being eaten by the Hindus. The flowers are red, the leaves about 12 inches in diameter, the fruit orange-shaped, containing numerous carpels, and the seeds black. The root-stock, or rhizome, contains starch. The E. is known to have been cultivated by the Chinese for at least 3000 years.

Euryale, a genus of starfishes (*Echinodermata*) belonging to the order *Ophiuroidea*, which also includes the sand-stars and brittle-stars. In E. the body exists in the form of a globose disk, with five obtuse angles, from which the prehensile arms are given off. The arms are long and contorted, but are even more so in the nearly allied *Asterophyton*, or "Medusa-head' starfish.

Eury'dice. See ORPHEUS.

Euse'bius Pam'phili (*i.e.*, E., the friend of Pamphilus) was born about A.D. 264 at Cæsarea, where he spent the most of his life. Till about forty years of age he lived in great intimacy with Pamphilus, Bishop of Cæsarea, who had an excellent library, in which E. studied diligently and profitably. On the martyrdom of his friend he fled first to Tyre and then to Egypt, where he remained till 315, when he returned to Cæsarea, and was elected bishop. In 325 he attended the Council of Nice, in which he took a prominent part, especially in trying to mediate between the Arians and the orthodox Church party. The first draft of the Nicene Creed was made by him, the term *homo-ousios* (importing that the Son was *of the same substance* with the Father, to which he was opposed as savouring of Sabellianism) and the anathemas being added by the Council. E., whose theology corresponds entirely with Origen's, 'was of the opinion that the Son could not be called absolutely eternal, like the Father; that it was necessary to ascribe to him an origin of existence from the Father, since thus only was it possible to hold fast the doctrine of *one* God; and that it was impossible to express the truth *after the manner of men* in any other way than by saying the existence of the Father precedes the existence and the origin of the Son.' E. was offered the patriarchate of Antioch about 330, but declined it. He died in 340. Of the writings of E., his *Chronicon*, a history of the world down to A.D. 328, is chiefly valuable for the extracts it contains from Berosus, Sanchuniathon, and other writers. The first complete edition was published by Mai and Zohrab (Milan, 1818). His most important work is his history of the Church from the death of Christ to 324. But his want of sound critical judgment is so manifest throughout—the history being full of references to spurious documents and names of unknown men, with improbable and ungrounded statements, and stories about miracles—that even his good faith has been called in question. The *editio princeps* of the Greek text appeared at Paris in 1549.—**E. of Nicome'dea,** Bishop first of Beryta (Beirut) and then of Nicomedea, and finally (338) Patriarch of Constantinople (died about 340), was the personal friend of Arius (q.v.), whom he attempted to defend at the Council of Nice. He consented, 'for the sake of peace,' to subscribe the creed drawn up at that council, but not the anathemas at the end, in which he was joined by Theognis of Nicæa. For this the two were condemned along with Arius, and banished to Gaul, being also recalled at the same time with Arius, 328. E. was the chief representative of the Semi-Arian (q.v.) party, which took up a middle position between the orthodox and the Arians, adopting the phrase *homoi-ousios* ('of a similar substance') to express the relation of the Son to the Father, from whom they received the name of Eusebians.—**E. of Emisa** (Phœnicia) was born at Edessa, and studied there, and at Alexandria and Antioch one of his instructors being E. of Cæsarea. As early as 312 he was distinguished for scholarship and modesty. He refused the bishopric of Alexandria when Athanasius was deposed in 341, but accepted that of Emisa soon after. He spent the close of his life at Antioch, and died about 360. In reference to the theological controversy of the day, E. probably belonged to the Semi-Arian party, of which his friend E. of Nicomedea was the chief.

Eusta'chian Tube. This is a tube leading from the back of the throat to the middle ear or tympanum. Its function is probably to equalise atmospheric pressure on both sides of the drum of the ear. Closure of this tube from inflammation and enlargement of the tonsils is one of the most common causes of deafness. See EAR.

Eusta'chius, Bartolommeo, a famous Italian anatomist, born early in the 16th c., but whose place and date of birth have not been ascertained, studied at Rome, practised there as physician, and died in poor circumstances in 1574. He enriched almost all departments of anatomical science by his discoveries, upon a number of which, as the *Eustachian tube* and *valve*, his own name has been conferred. Of his works, the *Tabulæ Anatomicæ*, the text of which appears to have been lost, consists of a number of excellent anatomical drawings, and was first published by Lancisi, at Rome, in 1714. Other works were issued under the editorship of Boerhaave at Leyden in 1707, and at Delft in 1736.

Eusta'thius, the most learned man of his age, was born in Constantinople, and flourished in the latter half of the 12th c. Successively monk, professor of rhetoric, and deacon, he died Archbishop of Thessalonica in 1198. His works consist of commentaries on Greek poets, theological treatises, &c., and establish both his learning and his oratorical power. The chief are his Commentaries on the Iliad and Odyssey (Leipz. 1825-29), on Dionysius Periegetes (Bernhardy's edition of that author, Leipz. 1828), and on Pindar. These commentaries are of the greatest value, as containing extracts from important works that are now lost.

Eusta'tius, St. (St. Eustache), a Dutch island in the W. Indies, 12 miles N.W. of St. Christopher. St. E. forms part of the colony of Curaçao, and is under a chief nominated by the Crown. Area, 7 sq. miles; pop. 1633. It is a mountainous mass of volcanic rock covered with vegetation, but has only one, and that a strongly-fortified landing-place. The chief productions are maize, sugar, cotton, and tobacco. The island is often visited by severe earthquakes.

Euter'pe (Gr. 'the charming one') was the Muse of lyric poetry. She was represented in ancient works of art with a flute.

Euterpe, a genus of *Palmæ* or palms. Of this group the mountain cabbage-palm and the edible E. are familiar species. The plants occur in S. America and the W. Indies. The male and female flowers occur on the same inflorescence. The stems are faintly annulated or ringed; the leaves are pinnate; and the bases of the leaf-stalks are very large, and form sheaths to the stem.

Eutro'pius, a Roman historian belonging to the 4th c. A.D., of whose life almost the only facts known are that he was an imperial secretary under Constantine, that he accompanied Julian in his invasion of Persia, and died probably about 370. He wrote an epitome of Roman history, *Breviarium Rerum Romanarum*, from the early kings to the reign of Jovian, which seems to have been carefully compiled, and which is composed in a succinct and singularly pure and simple style. It was once very popular, and was much used as a school-book, for which it was seemingly intended. The *editio princeps* appeared at Rome in 1471.

Eu'tyches, abbot of a monastery at Constantinople in the 5th c., who in seeking to combat Nestorianism fell into heresy himself. When the orthodox doctrine of the perfect equality of the Son with the Father had been established at the Council of Nice (325), the next difficulty was the union of this perfect God with the man Jesus; and Apollinaris (q.v.), holding the idea of a God-man to be a logical monstrosity comparable to a minotaur, affirmed that the Logos took the place of the mind in Jesus, whose soul and body alone were human, so that there was in reality but one nature in Jesus. In opposition to this the orthodox doctrine was next established (Council of Constantinople, 381) of the complete and real manhood of Jesus. But now the divine and the human nature, in being distinguished so carefully, came to be separated; they were held by some to be conjoined but not united. Nestorius, for instance, separated them so far as to refuse to call Mary the mother of God, which she was declared to be at the Council of Ephesus, 431. That council decided that in Jesus the two natures were not merely annexed but united. It was in pressing this doctrine one step too far that E. and his partisans revived the Monophysism of Apollinarius. E. declared that though there were two natures before the incarnation, there was but one after. He was also wont to call the body of Christ the body of God, and though he did not deny to him a human body, yet from a feeling of reverence he would not call it the same in essence as other human bodies. The Council of Chalcedon (451) condemned E., and defined the orthodox doctrine to be that in Jesus were united the two natures of a true God and a perfect man, 'unconfounded, unchanged, undivided, inseparable.' After this E. disappears from history, but his doctrines are still held by the Armenian and Coptic Churches.

Eux'ine (Gr. *euxeinos*, 'hospitable') is a name of the Black Sea. The earliest Greek navigators called it Axeinos (or 'inhospitable'), from the savage tribes that surrounded it; but when these had been civilised by commerce, they changed the name to Euxeinos.

Evan'der, of Pallantium, in Arcadia, was the son of Hermes by the nymph Themis, or according to Roman legend by the prophetess Carmenta or Tiburtis. Sixty years before the Trojan war, E. sailed for Italy with a Pelasgian colony. He landed on the bank of the Tiber at the foot of the Palatine, and there built the city Pallantium, from which, according to Varro, the names Palatium and Palatinus are derived. He taught the people laws, music, and the art of writing. He received Hercules after the conquest of Geryon, and raised altars to that hero, as well as to the Lycæan Pan, Demeter, and Poseidon, and assisted Æneas on his arrival in Italy. Divine honours were paid to E. at Pallantium in Arcadia and on Mount Aventine.

Evangel'ical Alliance, The, 'for the union and co-operation of Christians throughout the world,' was organized in London in 1846, at a meeting of some 800 professing Christians—Episcopalians, Methodists, Presbyterians, Independents, Baptists, Moravians, Lutherans, and others, and has taken root in many countries. Branches now exist in Great Britain and the Colonies, France, Belgium, Switzerland, Germany, Sweden, Norway, Italy, Greece, Turkey, Syria, Australia, India, New Zealand, and the United States. The chief object of the E. A. is 'to exhibit the unity of the one Church of God in doctrine, mutual recognition, and Christian co-operation for the advancement of evangelical truth throughout the world,' its motto being 'Unum corpus sumus in Christo.' The basis of the Alliance is that it is to be composed of such only as hold evangelical views in regard to the following points of doctrine:—(1) the divine inspiration, authority, and sufficiency of the Holy Scriptures; (2) the right and duty of private judgment in the interpretation of the Holy Scriptures; (3) the unity of the Godhead, and the Trinity of persons therein; (4) the utter depravity of human nature in consequence of the Fall; (5) the incarnation of the Son of God, his work of atonement for sinners of mankind, and his mediatorial intercession and reign; (6) the justification of the sinner by faith alone; (7) the work of the Holy Spirit in the conversion and sanctification of the sinner; (8) the immortality of the soul, the resurrection of the body, the judgment of the world by our Lord Jesus Christ, with the eternal blessedness of the righteous and the eternal punishment of the wicked; (9) the divine institution of the Christian ministry, and the obligation and perpetuity of the ordinances of Baptism and the Lord's Supper. A week of Universal Prayer takes place among the members throughout the world annually in January.

Since the formation of the E. A. general conferences, to which Christians of all nations were invited, have been held since 1846 in London, Paris, Berlin, Geneva, Amsterdam, New York, Basle, Florence, and Copenhagen, besides annual conferences in towns in the United Kingdom, and great national conferences elsewhere.

Evangelical Union, The, is a denomination of Christians which may be said to have been founded by Rev. James Morison, from whom it sometimes gets the improper title of Morisonians. Morison, minister of a congregation of the United Secession Church at Kilmarnock, was deposed for heresy in 1841, chiefly on the charge of teaching the universality of the atonement, and the ability of man to believe the gospel. His father, Robert Morison, United Secession minister at Bathgate, was also deposed in 1842, and A. C. Rutherford (Falkirk) and John Guthrie (Kendal) in 1843—all for holding similar views. These men and 'others, principally elders and delegates from Christian Churches,' met at Kilmarnock in 1843, at which conference a 'statement of principles' was adopted as the basis of an association, which was forthwith formed under the designation of the E. U., 'for the purpose of countenancing, counselling, and otherwise aiding one another; and also for the purpose of training up spiritual and devoted young men to carry on the work and pleasure of the Lord.' The E. U. does not profess to be based on any peculiar or distinctive Church polity, but to be a protest against certain of the leading dogmas of Calvinism; in short, those belonging to it take up the position of theological Nonconformists in Scotland. Their theology affirms:—I. as regards the divine purpose in redemption—(1) the universal fatherhood of God, and in consequence his desire to save all men, in opposition to the Calvinistic election; (2) the universal atonement of Christ, making the salvation of every man possible, in opposition to an atonement for the elect only; (3) the universal work of the Holy Spirit, or its desire to reach all men, and its sufficiency in every case to secure conversion: in opposition to the limitation of its work to the elect. II. as regards the application—(1) that the will of man must be in the matter of his salvation free and active: in opposition to the Calvinistic doctrine that man by the Fall 'hath wholly lost all ability of will to any spiritual good accompanying salvation'; (2) that a man is regenerated through faith, not in order to it; (3) that a man is elected to salvation 'through sanctification of the Spirit and belief of the truth,' and not predestinated by God unto life 'without any foresight of faith or good works, or any other thing in the creature, as conditions or causes moving him thereunto.'

There are in Scotland some ninety congregations belonging to the E. U., or affiliated therewith, that is, sympathizing with it in doctrine, and co-operating in Christian work without being formally connected. In England there are few churches belonging to the Union, but a large number of ministers, its ministers being eligible for Congregational churches there.'

Evan'gelist means (1) 'a bringer of good news'; (2) in the New Testament, a preacher of the gospel, *i.e.*, not a settled pastor, but an itinerant preacher or missionary (2 Tim. iv. 5), the pastor being called presbyter or elder. Eusebius speaks of the E. as if he had been a colporteur of the written Gospels, which he could not have been at the time he speaks of. This idea led to the later meaning attached to the name of the E. *par excellence*, as (3) the writer of a Gospel. (4) In still later liturgical language the E. was the reader of the Gospel for the day.

Ev'ans, Lieutenant-General Sir De Lacy, G.C.B., a distinguished British soldier and Liberal politician, was born at Moig, in Ireland, in 1787; entered the army in 1807; distinguished himself in the Peninsular War, especially at Vittoria and Toulouse; in 1814-15 served in N. America, and was severely wounded at New Orleans; in 1815 was at Quatre-Bras and Waterloo as aide-de-camp to General Ponsonby. In 1831 he was elected member for Rye, and in 1833 for Westminster. In 1835 he accepted the command of the British Legion, of 10,000 men, raised to maintain the throne of Isabella II. of Spain against the Carlists, and was victorious before San Sebastian, Pasages, and on the heights of Amozagana, and closed the campaign by the storm and capture of Irun. He was defeated for Westminster in 1841, but was re-elected in 1846, and retained his seat till 1865, when he retired from public life. In June, 1854, he was raised to the rank of lieutenant-general in the British army, and in the Crimean war of 1854-55 commanded the second division of the British forces, fighting with signal intrepidity at Alma and Inkerman. Failing health forced him to return to England in the beginning of 1855, when he received the thanks of Parliament for his services in the field. He received the Grand Cross of the Bath, the Grand Cordon of the Legion of Honour, and the degree of D.C.L. from Oxford. E. died 9th January, 1870.

Ev'ansville, an important city of Indiana, U.S., on the Ohio, 50 miles above the confluence of the Wabash. It has a U.S. marine hospital and several public halls. As the southern terminus of the Wabash and Erie Canal, E. has great facilities for trade and navigation. There are flour-mills, iron-foundries, and manufactures of wool, leather, &c. The town has several daily newspapers. Pop. 50,756. In 1880 the inhabitants numbered 29,280.

Evapora'tion is the conversion of a liquid at its surface into the gaseous form. Dalton showed that if a liquid be permitted to evaporate in a vacuum, the E. goes on till a certain quantity of vapour is formed, whose pressure depends upon the temperature. When a liquid is vaporised, heat is absorbed, and therefore must be abstracted from surrounding matter or from the liquid itself. For instance, if a thermometer bulb be dipped in ether and then exposed to the air, the ether is rapidly evaporated, the heat necessary for this being obtained from the mercury, whose temperature is therefore lowered. Again, if a tube terminating at each end by a bulb be taken, with a little water in the one bulb and water vapour in the rest of the tube, by simply immersing the other bulb in a cold liquid a condensation of the vapour there takes place, and this necessitates an E. and therefore cooling of the water, which is thus made *to freeze by its own E.* Liquids which vaporise rapidly at ordinary temperatures are said to be volatile, and every liquid increases in volatility as its temperature approaches that of its boiling-point. Pressure also has a very great effect upon E., so much so that by a rapid diminution of pressure a liquid may be made to boil at a temperature considerably below its true boiling-point. When it is considered how great a proportion of the earth's surface is liquid, it is evident that E. must play an important part in the economy of nature. The air always contains water vapour in varying quantities, depending on the temperature and pressure. When air saturated with water vapour is cooled, the vapour is condensed and forms clouds of rain, snow, or hail, according to the circumstances in which it has been cooled. This physical E. is so intimately involved in other meteorological operations that for further information in this connection reference is made to such articles as CLIMATE, CLOUDS, DEW, WINDS, &c.

A very beautiful explanation of E. is furnished by the modern Molecular Theory (q.v.) of the constitution of matter. According to this theory the average velocity of the molecules of a liquid is less than that of its vapour; but some of the former may be moving with velocities equal to, or even greater than, the average velocity in the vapour. If such a molecule should be at the surface and be moving *from* the liquid, it will fly off into space as a vapour molecule. Also, a vapour molecule striking the liquid may become part of the liquid if entangled among the liquid molecules. Such is the theory of E. and condensation. The former depends on the temperature and extent of surface of the liquid, the latter upon the temperature and pressure of the vapour. If the liquid be evaporated in a closed vessel, things will go on until the pressure of the vapour is sufficient to render the number of the molecules condensed equal to the number evaporated. At this stage E. is usually said to cease, but upon the theory it is going on as fast as ever, only it is neutralised by an equal condensation.

Eve is the name given in the Hebrew scriptures to the first woman, who was so called by Adam, according to the narrative, 'because she was the mother of all living' (Heb. *khavah*, 'life' or 'life-maker'). See ADAM.

Evec'tion (Lat. *evectio*, 'a carrying out'), the name applied by Bullialdus to an inequality, first noticed by Hipparchus, which consists in the alteration of the eccentricity of the lunar orbit, produced by the difference of the sun's attractions upon the moon at its apogee and perigee—a difference which depends upon the relative positions of the lunar line of apsides and the earth's radius-vector.

Eve et Treve (Scotch law), a term for slaves or servants. See COLLIERS AND SALTERS.

Ev'elyn, John, an English author and man of science, was born at Wotton, Surrey, 31st October, 1620. Educated at Balliol College, Oxford, he seems to have been intended for the law, for he studied at the Middle Temple (1640-41); but the civil war, in which he took the side of the Royalists, compelled him to travel for a time, particularly in France and Italy. Assisting in the Restoration of 1660, he was received with favour at the Court of Charles II., became one of the founders of the Royal Society in 1662, and at its request, when the English Naval Commissioners dreaded a scarcity of naval timber in the country, wrote (1664) *Sylva, or a Discourse on Forest Trees, and the Propagation of Timber in His Majesty's Dominions,* which induced landowners to plant a great number of young oak-trees, from which were obtained the war-ships of the next century. He died 20th February, 1706. E. wrote popular works on various subjects, such as sculpture, architecture, &c., but will be chiefly remembered as perhaps the first in England to treat gardening and planting scientifically, and for his *Diary*, which is probably unsurpassed for the curious and minute information which it gives regarding society in the latter half of the 17th c. It was published under the editorship of W. Bray in 1818, and has gone through several editions.

Eve'ning Primrose. See ŒNOTHERA.

Ev'erett, Alexander Hill, an American author and diplomatist, was born at Boston, Massachusetts, 19th March, 1792. He graduated at Harvard in 1806, studied law in the office of John Quincey Adams, and in 1809 accompanied him on his mission to Russia. He was appointed minister at the Hague in 1818, and at the court of Spain in 1825. Returning to the United States in 1829, he became editor and proprietor of the *North American Review.* In 1845 he was sent as minister to China, and died in Canton, 29th June, 1847. E.'s works, which exhibit much learning, varied knowledge, and fine talent, are—*Europe, or a General Survey of the Principal Powers* (1822); *America, or a General Survey*, &c. (1827); *New Ideas on Population* (1822); *Essays* (1845 and 1847).—**Edward E.,** brother of the foregoing, was born at Dorchester, near Boston, Massachusetts, 11th April, 1794. He studied at Harvard College, and graduated in 1811. At twenty years of age he became pastor of a Unitarian church in Cambridge, and soon gained distinction by his brilliant pulpit efforts. He appeared as an author in 1814 with a *Defence of Christianity*, and next year was elected Eliot Professor of Greek in Harvard College. To prepare himself for this position he resided four years in Europe, associating with some of the most distinguished men, Cousin regarding him as 'one of the best Grecians he ever knew.' E. returned to the United States in 1819, became member of the House of Representatives in 1824, and Governor of Massachusetts in 1835. He was made minister at the court of St. James in 1841, became President of Harvard College in 1845, was appointed Secretary of State in 1852, a United States senator in 1853, and died 9th January, 1865. E.'s *Orations and Speeches* (1850-68) are a brilliant embodiment of his public career. Although not a profound statesman, he was one of the most eloquent and accomplished of American orators.

Ev'ergreens, a name popularly applied to such plants as retain their verdure and foliage throughout the year, this property being chiefly due to the thickness of the leaf substance, and to the retardation or absence of the chemical changes in virtue of which the leaves of other plants fall and wither. Of E., firs, heath, rhododendrons, laurels, holly, ivy, box, privet, some oaks, bays, myrtles, &c., are well-known examples. E. are much in request for the decoration of garden policies, churches, &c.

Everlast′ing Flowers, the name given to certain kinds of flowers belonging to Composite plants, from their dry, firm structure, which enables them to resist the process of decay for a long period. The species of the genus *Gnaphalium* (*e.g., G. orientale*) are much in request as E. F.; and species of *Helichrysum* are also termed E. F. from their durability. The flowers of *G. orientale* are used by the French in making *immortelles* to decorate tombs. The species of *Helichrysum* are chiefly natives of Africa, but some (*H. arenarium*) grow in Southern Europe.

Ev′ersley, Viscount, Charles Shaw Lefevre, an English politician, was born 22nd February, 1794, educated at Winchester School and Trinity College, Cambridge, entered Parliament in 1830, and from 1832 to 1857 represented N. Hants. In May, 1839, he was chosen Speaker of the House of Commons after the elevation of Abercromby to the peerage as Lord Dunfermline, and this post he held uninterruptedly for eighteen years, the Conservative ministry of Sir Robert Peel having offered no opposition to his re-election. A fine and dignified presence, affable manners, perfect acquaintance with the forms of the House of Commons, and absolute impartiality, made Lefevre one of the most popular and successful of Speakers. When he retired from public life with a peerage as Viscount E. and a pension of £4000, his retirement was universally regretted. E. was a D.C.L., and held numerous posts, including those of High Steward of Winchester, Governor of the Isle of Wight, Commissioner of Church Estates, and (in 1859) Ecclesiastical Commissioner. Died 28th December, 1888.

Eves′ham (Old Eng. *Eofesham*, 'the dwelling by the river's brink'), a market-town of Worcestershire, 15 miles S.E. of Worcester. It stands on a slope above the Avon, in the vale of E., which is famous for its beauty and fertility. The chief buildings are the churches of All Saints (13th c.) and of St. Lawrence, a fine corn exchange, institute, efficient grammar school, and public library. Of the abbey, only the bell-tower (commenced in 1553), 110 feet high, remains. There are manufactures of agricultural implements, gloves, and hosiery. E. arose from a monastery founded in 709. Here Prince Edward, afterwards Edward I., defeated Simon Montfort, 4th August, 1265. Till 1867 E. returned two members to Parliament; till 1885 only one. Pop. parl. div. of county 49,538; reg. sub-dist. 9112; and mun. bor. 5836.

Evic′tion, in Scotch law, is the dispossessing one of property, heritable or moveable, in virtue of a preferable title in the person of him by whom the E. is made. The dispossessed party will be entitled to institute an action against his author, the value of the claim being regulated by the nature and extent of the Warrandice (q.v.). A purchaser is not bound to defend a hopeless case, and he may bring his action of relief before E. actually has taken place, if it be imminent or the author disputes the right of relief. A tacksman or rentaller has also a remedy in case of E. Thus, if the E. be permanent and total, or if it be temporary, an ordinary action of damages lies; if the E. be permanent and partial, the claim will be for an abatement of rent. If the E. be caused by that for which neither party is responsible, then no action lies. In England the possessory action by which the title to lands and tenements could be tried and possession recovered was called Ejectment (q.v.). The Common Law Procedure Act of 1852 abolished the action of ejectment and substituted one of simply claiming the land, and this action has now been called, under the Judicature Act, *Recovery of Land*.

Ev′idence, Le′gal, may be defined as any matter of fact tending to affirm or disaffirm the alleged existence of some other matter of fact. It may be in writing or by testimony of witnesses. Written proofs consist of records, ancient deeds, and wills thirty years old, which prove themselves; but modern deeds and other writings must be attested and verified by the parol testimony of witnesses, if still living. See PAROL PROOF.

The rule in all trials is that the best evidence must be produced which the case admits of, for if it be shown that better evidence exists than that which is produced, then the non-production causes a presumption that it would have disclosed some hidden falsehood. Thus it would not be allowed to prove the terms of a lease by an attested copy or by parol evidence, the lease itself being proved to be forthcoming; but the deed being shown to be lost, then secondary evidence is available.

Letters are evidence *against* the writers but not for them. Entries in family Bibles and other books by parents or heads of families are good evidence of the facts recorded. A receipt *in full*, when obtained without fraud or collusion, is conclusive against the party who grants it. An account in a tradesman's books, if supported by collateral proof of fairness and regularity, would probably be sufficient evidence of debt. In England the law limits this proof to transactions within *one year* before the action brought, unless between merchants in the usual course of trade.

The Statutes 6 & 7 Vict. c. 85, 14 & 15 Vict. c. 99, 16 & 17 Vict. c. 83, and 28 & 29 Vict. c. 104, render the following persons competent, and (with the exception of the Sovereign and foreign ambassadors) compellable witnesses:—The Sovereign, foreign ambassadors, persons interested in the result, parties in civil cases, and their wives and husbands, believers of all creeds, and atheists (if they comply with the Oaths Act of 1888), deaf mutes, accomplices, and convicts; also bankers, when not parties to the proceedings, but only by judge's order to produce and prove their books. But a husband is not a competent witness against his wife, nor a wife against her husband, in criminal procedure or in case of adultery. During marriage, neither husband nor wife can be compelled to disclose any communication made by the one to the other. Infancy (to a certain extent), lunacy, drunkenness, &c., when preventing a person from understanding the nature of an oath or from giving rational testimony, renders that person incompetent as a witness. In criminal proceedings an accused person, and, as stated, the husband or wife of accused, and a person jointly indicted and tried with the accused, are incompetent except in certain cases and offences. In violence between husband and wife, either can be called as a witness against the accused, and also in criminal proceedings under the Married Women's Property Act of 1882. Persons charged under Criminal Law Amendment Act of 1885 may give evidence, and their husbands or wives are competent but not compellable witnesses; also the same rule applies as to competency under the Merchandise Marks Act of 1887, the Libel Amendment Act of 1888, and the Prevention of Cruelty to Children Act of 1889.

The Act 32 & 33 Vict. c. 48 allows the judge, in place of the former oath, to administer to a witness this declaration if he objects to be sworn and states as the ground of his objection that the taking of an oath is contrary to his religious belief, or if he objects to be sworn and states as the ground of such objection that he has no religious belief; in *civil cases*:—'I, A. B., do solemnly, sincerely, and truly declare and affirm.' Here follow the words addressed to A. B. by the officer of the Court: 'The evidence that you shall give to the Court and jury *touching the matter in issue*, shall be the truth, the whole truth, and nothing but the truth.' And in *criminal cases*, the form of affirmation is the same, save the words italicised, for which is substituted, '*between our Sovereign Lady the Queen and the prisoner at the bar*,' or '*between our Sovereign Lady the Queen and the defendant*' (when the accused is not in custody). Any one giving false evidence after making this declaration is liable to the penalties of perjury.

No counsel, attorney, or other person *professionally* connected with the cause can be compelled to disclose matter confidentially intrusted to him. But lawyers not engaged in the cause, physicians, divines, servants, and friends can be compelled to divulge all matter relevant to the issue, though it has been imparted to them in the strictest professional confidence, and however delicate its nature. The courts of law in England, Scotland, and Ireland are empowered to summon witnesses *out* of their jurisdiction; witnesses not appearing to be punished by the court of the county in which the process has been served in the same manner as in disobedience to a writ of Subpœna (q.v.). The superior courts at London and Dublin, the Court of Session in Scotland, and the supreme court in any colony or possession of her Majesty, are authorised on due application to issue an order to examine witnesses in suits pending before any tribunal in her Majesty's dominions. See WITNESS.

E'vil (Old Eng. *yfel*, Pl. Deut. *oevel*, Dut. *euvel*, Fris. *evel*, Ger. *übel*, Old High Ger. *ubil*, Mœso-Goth. *ubels*; the root is uncertain) is a term of theological origin, partially adopted into the language of common life, and usually understood to mean whatever is contrary to our ideas of moral rectitude and tends to interfere with the general happiness of mankind physically, morally, and socially. Traces of something wrong in all the departments of human life, that seems irreconcilable with the rule of infinite power, wisdom, and goodness in the universe, are not far to seek nor hard to find. Besides the more directly physical evils, such as the havoc caused by hurricanes of wind on sea and land, earthquakes, explosions, epidemics, &c., we find, *e.g.*, tribes of human beings living for centuries in brutish ignorance, and finally left to perish by pestilence and internecine war. We have the sufferings and sorrows of the multitudes who are born into the world with constitutions predisposing them to physical disease and pain, and to moral obliquity, and who get in their upbringing a special training to vice, cruelty, and crime. We see the talented, the useful, and the benevolent cut down in the prime of life, while the stupid and the useless are spared. We see on the one side honesty in rags, innocence ruined and oppressed, martyrs imprisoned, tortured, and put to death; and on the other knavery and tyranny stalking in prosperity and honour. The mystery of the existence and cause of all this is one which men have been trying to explain ever since speculation began. Two great modes of solution have been attempted, the *Dualistic* and the *Pantheistic*. 1. Under the former may be classed:—(1) The Eastern speculators, who accounted for E. in the world by the innate opposition of matter to the divine will. By the one absolute, uncreated, universal Being—according to the Zend-Avesta, the sacred books of the ancient Parsees—were created two deities, the gods of light and darkness, of wisdom and ignorance, of good and E.; the latter coming first, and the former being produced as a remedial principle to regulate the work of the latter. The Gnostic sects of the early Christian Church adopted these dualistic notions from the East, which were fully developed by (2) the Manichæans, who either ascribed the origin of E. to the Demiurgus (the creator of the material world, himself created by the Eternal), or maintained that it was inherent in matter. The ascetic practices, so common among Christians at the time, indicate the prevalence in the Church of the view akin to this, that the body is the seat and organ of sin. (3) The Christian fathers, who, generally speaking, traced the origin of E. to the rebellion of the human will against the will of God, although some of them ascribed it to sensuality, and Athanasius, as well as Origen, regarded moral E. as something negative. Augustine arrived at the same conclusion by a different road. (4) Another theory accounts for E. on the principle of necessary opposition or antagonism. As there is no rest without fatigue, no pleasure without pain, &c., so there could be no virtue without vice. Moral goodness is the mastery over moral evil. 2. The *Pantheistic* theory of E. depends of course on its theory of ontology. This system, the earliest known origin of which was in India, teaches that the eternal, infinite Being creates by self-evolution, whereby he becomes and is all existence. Accordingly, as it is expressed (1) by the modern philosophers of this school (*e.g.*, Spinoza), E. is only limitation or modified good, for the modes of action are all alike modes of God's activity. Thus the less of being the less of good, and E. is what is finite, for the finite is simply the negation or limitation of infinite being. We may also note another theory associated with the name of Leibnitz, who resolves sin into privation, and refers it to the necessary limitation of a creature. God could not create a world without sin, because he could not make creatures absolutely perfect. (2) The theory held by Bolingbroke, and the sceptics of his time, who account for the origin of E. on the æsthetic principle of the proportion of parts in the scale of sentient being. As animal life is graduated from the highest intelligence down to the point at which the animal seems half a plant, so in the moral world 'there is a ladder whose top reaches the loftiest unselfishness, and whose rounds gradually descend to the grossest forms of moral life.' (3) The fatalistic theory of the Deists of last century, which Butler sought to refute. As the universe is the necessary outcome of the necessary existence of God, all the orders of existence in the universe, which must also be necessary, are fated to form links in one chain of eternal and unalterable necessity, and to be as they are at any given stage of their development.

The great difficulty in the way of accounting for the existence of E. lies in the two doctrines of the existence of a personal God of infinite power, wisdom, and goodness, and of the free, self-determining action of the human will. Accordingly most of the theories enumerated above try to get rid more or less of one or other of these two doctrines; some of them of both. Those who give up the personality of God find a solution of the problem to their own satisfaction in maintaining that by so doing they render E. and sin in the ordinary sense *meaningless*, because these terms point back to a period in the childhood of mankind when human duty was held to consist in obeying a series of positive commands, and that what they represent are merely the results of imperfection or ignorance. Of all the solutions of the mysterious problem given by those who retain the two conditions, not one amounts to a real explanation of the difficulty. Perhaps no adequate explanation is possible to finite beings in their present condition. But as science more and more fully reveals the beautiful evolution by which from the lowest forms in nature endless varieties have been produced, as history gradually recognises in civilisation the outcome of a perpetual struggle against obstacles to its advance, a hope arises in the human mind that there is in the dread phenomena of E. a purpose which may one day be seen to be not incompatible with the wisdom and goodness of an Almighty Being.

Evil Eye. The belief that the human eye can put forth powers of positive mischief, can blight and destroy everything that has life, appears to have prevailed universally over the ancient world—in Europe, Asia, and Africa. It is still prevalent in heathen countries, and maintains its ground to some extent in Christendom. The Greeks used the word *baskainō*, the Latins *fascino*, to describe this baleful influence. In Italian we have the *mal occhio*, in French the *mauvais œil*; and most languages bear witness to the existence of the belief. We meet with the phrase 'eye-bitten cattle,' 'eye-biting witches,' in treatises on the subject, and it was an old belief in England that those persons who 'had two balls, or two *blacks* in the apple of the eye' (what is called a double pupil), possessed much of this baneful power. Hence probably the common saying, 'No one can say that black is the white of my eye'—can say that I have an E. E. The number of amulets, charms, and spells 'defensative' or 'counteractive,' recommended in books, ancient and modern, against the E.E. is very great. Bathing the eye with saliva is thought very effective in neutralising the destructive influence for a time, and it is still common when any object of great value or beauty is to be viewed to hear one person say to another, 'Bathe your eye before you look at it'; and 'spitting three times in the eye' is sufficient to undo the strongest spell. In England 'turning the coal,' as it is called, will not merely neutralise the evil, but actually turn the tables on the witch, and make her feel as if a red-hot coal lay on her heart until she withdraws her charms. In Scotland the 'mountain ash,' or rowan-tree, is the great preservative or 'saining' agent. A piece of this wood worn on the breast keeps a man scatheless. A branch of rowan laid above the byre-door will ordinarily protect the cattle, and in special circumstances a twig twisted in the hair of the cow's tail will guard any individual cow; or, laid under the churn, will ensure its yielding the due proportion of butter.

The belief in an E. E., though it has assumed a multitude of grossly superstitious forms, has doubtless originated, like many other superstitions, in the exaggeration of a natural fact. The power of the eye is in reality almost unlimited; some men can read unerringly the thoughts of others by a single glance. This mysterious capability in times of widespread ignorance would naturally engender a thousand crude fancies in the breasts of ignorant people, which astute and cunning men would easily turn to their advantage.

Ev'olute and In'volute. If a stretched inextensible cord be supposed wound round a given plane curve, each point of the cord, when unwound under tension, will describe a curve, of which the original curve is the E. These evolved curves again are *involutes* of the original curve. It is apparent, then, that a given plane curve has an infinite number of similar involutes, but has only one E. A kinematical consideration of the above method of description shows that tangents of a curve are normals to its I., and normals to a curve are tangents to its E.; and that an E. may, therefore, be defined as the locus of the ultimate intersections of the normals, or, in other words, the locus of the centres of curvature. The circle has no E., or rather its E. is reduced to a single point. Its I. is a spiral, and is of some practical importance in the making of toothed wheels. The involutes of the cycloid and equiangular spiral are geometrical curiosities, as being similar and equal cycloids and spirals. The analytical methods of investigation of these derived curves will be found in most text-books on the elements of the differential and integral calculus.

Evolu'tion and Involu'tion are two inverse algebraic operations, the latter concerning itself with the *raising* of numbers or expressions to *powers*, the latter with the *extraction of roots* of similar quantities. Thus $a \times a \times a$ is a raised to the third power, and is written a^3; and in the same way a^n is unity multiplied by a n times. This is a case of I., and is the case which occurs constantly in arithmetic. In algebra, however, the term has a far wider significance, being the expression of the sum of n quantities raised to the mth power as the sum of a series of determinable quantities, or in other words, the expansion of

$$(a_1 + a_2 + a_3 + \ldots\ldots + a_n)m.$$

The binomial theorem

$$(a + b)^n = a^n + na^n - 1b + \frac{n^2}{1\cdot 2} a^n - {}^2b^2 + \ldots\ldots$$

is a special case of I., and one of very frequent occurrence, and of great importance in both pure and mixed mathematics.

E. is usually called in arithmetic the *extraction of roots;* that is to say, given any number or expression, it is required to find that quantity which when raised to a given power will be the given quantity. It thus requires in the first place a knowledge of I.; and this knowledge is sufficient to obtain the method of solution. We shall here indicate the general method by the consideration of the special case presented by the *cube root.* From I., we know that

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3.$$

The cube root, then, of the right-hand expression is $a + b$, the first term of which is a, the cube root of a^3.

$$\begin{array}{r|l}
 & a^3 + 3a^2b + 3ab^2 + b^3\,(a + b) \\
3a^2 + 3ab + b^2 & a^3 \\
\cline{2-2}
 & \qquad 3a^2b + 3ab^2 + b^3 \\
 & \qquad 3a^2b + 3ab^2 + b^3
\end{array}$$

Subtracting a^3, we have three terms remaining for which we must find a divisor such that the quotient may be b. The first term of this divisor is evidently three times the square of the first term of the answer; and to this must be added three times the product of the first and second (which latter is obtained from consideration of the trial divisor $3a^2$) and the square of the second. If there be a third term in the answer, the first two must be taken as one term and treated in the same way. The application to arithmetic is easy, if the value of each figure in the number, as to whether it represents units, tens, hundreds, or thousands, be always kept in view. The full treatment both of the square and cube roots, which are alone of any practical importance, may be found in any treatise on elementary algebra.

Evolution Theory, in its widest signification, is an hypothesis which regards all nature, physical and biological, as the result of a development from the general to the special, from the simple to the complex; at the same time viewing human progress, the growth of language, literature, moral and religious sentiments, science, and art, as but the higher and ultimate results of the same natural laws acting through endless variations. The idea of evolution is truly philosophical, but no full explanation of its working has as yet been given, notwithstanding numerous attempts. Darwin's theory of natural selection (see DARWINIAN THEORY) may account for the transmission and perpetuation of useful variations, but it cannot account for variation itself; while Herbert Spencer's bold attempt to produce from a homogeneous distribution of matter a heterogeneous but dynamically stable universe, with the subsequent development of life, instinct, reason, and social and moral qualities, is unsatisfactory, and even in certain instances self-destructive in its reasoning.

Evolutions, Military, include all the movements of troops under command, in times of peace and war. The tendency of the development of the art of warfare is to simplify E.; and in modern Drill (q.v.) the soldier is in many cases intrusted to perform some of them in the manner which, in certain circumstances, seems to him the best. See TACTICS.

Ev'ora (anc. *Ebora* and *Liberalitas Julia*), a town in the district of E., and the capital of Alemtejo, Portugal, situated on a high plain, 73 miles E. by S. of Lisbon by railway. It is the see of an archbishop (since 1541), was often in former times the residence of the king and the seat of the Cortes, and has two ruined forts, a large Gothic cathedral (1186), several convents, and a library of 50,000 vols. Its manufactures are chiefly leather and ironwares. Pop. 25,177. E. was captured by Sertorius in 80 B.C. Taken by the Arabs in 712, it was recovered in 1166. The Roman antiquities of E. have attracted much attention. They consist chiefly of a temple of Diana, with Corinthian columns, now used as a slaughter-house, and an aqueduct, part of which was demolished in 1875. At the end of the aqueduct is an exquisite tower, one of the finest specimens of Ionic architecture in the Peninsula.

Ev'remond, Charles de Marquetel de St. Denis, Seigneur de St., a famous wit and epicurean of the 17th c., was born at St. Denis du Guast, near Coutances, 1st April, 1613. He was the son of a baron, and after studying in a Jesuit college, entered the army, where his wit and bravery won him the friendship of Turenne, Condé, and other distinguished men. Condé gave him a lieutenancy, which he lost, along with the prince's favour, for indulging in indiscreet raillery. At the time of the Fronde he satirised the king's enemies, but shortly afterwards was imprisoned during three months for a rash witticism on Mazarin, and his sprightly sallies against the treaty of the Pyrenees compelled him to flee to England in 1662. There he became one of the brightest ornaments of the giddy Restoration society. Charles II. gave him a pension of £300. William III. was also charmed with E., who, though pardoned by Louis XIV. in 1689, remained in England till his death at London, 20th September, 1703. His letters were scarcely surpassed, even in French literature, for polished and easy vivacity.

Évreux' ('on the waters,' anc. *Mediolanum*, later *Eburovices*), the capital of the department of Eure, France, on the Iton, 67 miles W.N.W. of Paris by railway. It is the seat of a bishop, and has a fine cathedral of the 11th c., a clock-tower of 1417, an episcopal palace (1484), a theatre, a botanic garden, and elegant promenades. The manufactures are cotton and woollen fabrics, leather, liqueurs, &c. E. was pillaged by Rollo and his Northmen in 892, and was burned by Henry I. of England in 1119. In the reigns of Henry V. and Henry VI. it was repeatedly in the hands of the English. Pop. town 16,932; arrond. 111,261.

E'wald, Georg Heinrich August von, one of the most illustrious biblical scholars of the 19th c., was born at Göttingen, 16th November, 1803, studied at the university of his native town, where he became in 1827 extraordinary, and in 1831 ordinary, Professor of Philosophy. In 1835 he was appointed Professor of the Oriental Languages. Travels in search of Oriental MSS. took him in 1826, 1829, and 1836 to Berlin, Paris, and Italy. As one of the seven Göttingen professors who protested against the abolition of constitutional law and liberty in Hanover, he was dismissed from his chair, 12th December, 1837, and thereby obtained leisure for a visit to England. In 1838 he accepted a call as ordinary Professor of Theology to Tübingen, was ennobled by the King of Würtemburg in 1841, and returned to Göttingen in 1848; and in the North German *Reichstag* of 1867 was conspicuous by his Hanoverian and anti-Prussian policy. E.'s works on the Hebrew language, his exegesis of the Old Testament, and his treatment of Jewish history in this department of learned labour, have that supreme merit which the Germans call 'epoch-making.' They have moulded the critical conceptions of all subsequent scholars, and have left a lasting impress on biblical study. E. is probably the greatest genius that has adorned modern German theology. E. also thoroughly studied the other Oriental languages, epecially the Arabic, Aramaic, Ethiopic, Phœnician, Persian, and Sanskrit. In some respects his *Grammatica Critica Linguæ Arabicæ* (Leipz. 1831-33) is still unsurpassed. He made numerous contributions to Oriental and biblical literature. E. died at Göttingen, 5th May, 1875.

Ewald, Johannes, the greatest lyric poet of Denmark, was born at Copenhagen, 18th November, 1743. He lost his father at the age of eleven, and was educated at Slesvig school. His romantic adventurous spirit prompted him, when only sixteen, to join the Prussian army, which he afterwards quitted for the Austrian service. In 1760 he returned to Copenhagen and devoted himself to theology, but his studies were cut short by a disappointment in love. He was then aged twenty-two, and had given no proofs of a poetic gift; but a funeral ode which he wrote on the death of Frederik V. of Denmark in 1767 gave him a high literary standing. He became rapidly famous as a lyric and dramatic poet, but sank into dissipation and poverty, and was deserted by his mother and nearest relatives. Finally he received a government pension, and died at Copenhagen, 17th March, 1781. In E.'s time a bitter feud was going on between the French and the German schools in Danish literature, and E., who was an ardent disciple of Klopstock, did much to introduce German ideas and tastes. E.'s lyrics are the finest in Danish poetry. His *Kong Christian stod ved höien Mast*, which is translated by Longfellow, has become the Danish national anthem, and many of his sea-songs are very popular. His works are carefully finished, sometimes bombastic, and sometimes bright with heroic exultation or fantastic humour. His dramas include *Adam og Eva*, *Lykkens Tempel*, *Balders Död*, and *Fiskerne*—the two last being probably his masterpieces. See the lives of E. by Molbech (1831), Hammerich (1851), and Olsen (1861).

Ewe, a female sheep, whose wool has been twice clipped, and which has proved itself fertile. *Ewe hogg*, a female lamb. The origin of *hogg* is thought to be the Celtic *og*, 'young,' whence *ogan*, 'a young man,' and *oigie*, 'a virgin.' *Eild gimmer*, a ewe hogg twice shorn, which has not been mated. See Stephen's *Book of the Farm*.

Examinations for the Public Service. Formerly appointments in the Civil Service could only be obtained through patronage. In 1853 a Committee of Inquiry was appointed, and in conformity with its recommendation, a qualifying examination was instituted in 1855 for entrance to many of the departments, in addition to the nomination. By an Order in Council, dated 4th June, 1870, the appointments in most of the public offices were thrown open to persons who, without previous nomination or private influence, should offer themselves as candidates, and compete at the appointed examinations under regulations framed, or to be framed, in pursuance of 5th clause of that Order, by the Civil Service Commissioners and with the approval of the Lords of the Treasury.

At the present day there are five ways of admission to the Civil Service:—

(1) By open competition, under the clause of the Order in Council already referred to, and subject to the 'General Regulations.'

(2) By open competition, not under the said clause and not subject to the 'General Regulations.'

(3) By limited competition and nomination by heads of departments in which the vacancies occur.

(4) By qualifying examination and nomination—by competition, should the head of the nominating department require it.

(5) By nomination and qualifying examination, which may be partial or may be dispensed with altogether on the Commissioners being satisfied that the candidate possesses the requisite qualifications.

The subjects of examination (1) for clerkships (Class I.), together with the maximum of marks allotted to each subject, are substantially identical with those prescribed for the Indian Civil Service, which are here set forth:—English composition, 500; Sanskrit language and literature, 500; Arabic language and literature, 500; Greek language and literature, 750; Latin language and literature, 750; English language and literature (including special period named by the Commissioners), 500; French language and literature, 500; German language and literature, 500; mathematics (pure and applied), 900; advanced mathematical subjects (pure and applied), 900; natural science (any number not exceeding three), elementary chemistry and elementary physics (not to be taken up with either higher chemistry or higher physics), 600; higher chemistry, 600; higher physics, 600; geology, 600; botany, 600; zoology, 600; animal physiology, 600; Greek history (ancient, including constitution), 400; Roman history (ancient, including constitution), 400; English history, 500; general modern history (period to be selected by candidates from list issued by the Commissioners, one period at least to include Indian history), 500; logic and mental philosophy (ancient and modern), 400; moral philosophy (ancient and modern), 400; political economy and economic history, 500; political science (including analytical jurisprudence, the early history of institutions, and theory of legislation), 500; Roman law, 500; English law (to include law of contract, law of evidence, law of the constitution, criminal law, law of real property—only four of these subjects may be offered), 500. No subject is obligatory, and a candidate may offer any or all of them. The limit of age for the appointments in England is 22-24; and that for those in India is 21-23. The fee payable by the candidate is £6. It may be mentioned here that six of the candidates who were declared in October, 1895, by the Civil Service Commissioners to have shown a competent knowledge of the subjects of the Final Examination for the Indian Service, were Asiatics, and that one of these headed the list, another was third, another fourth, and another seventh.

The following posts have been placed under (1):—Clerkships in the Admiralty, Civil Service Commission, Colonial Office, Customs, Ecclesiastical Commission, Home Office, India Office, Inland Revenue, Local Government Board (England and Ireland), Lunacy Commission, Patent Office, Record Office (England and Ireland), Science and Art Department, Board of Trade, Treasury, and War Office; also clerkship in the Veterinary branch of the Chief Secretary's Office (Ireland), clerkship in the Inspector General's Office (Constabulary, Ireland), and clerkship in Secretary's Office (Post Office, Grade I.).

The examination for Clerkships of the Second Division, which come under (2), is held under the same conditions as the examination for clerkships under (1), the subjects being adapted to persons of inferior education, and the appointments consequent on passing being of course of smaller value and importance. The subjects are—Handwriting, orthography, arithmetic, copying MS. (to test accuracy), indexing or docketing, digesting returns into summaries, English composition, geography, English history, book-keeping. The fee is £2, and candidates must be over 17 and under 20 years of age on the first day of the examination.

The most important and lucrative branch of the Civil Service open to competition is that of India. Every candidate for appointment, either in the United Kingdom or in

India, must satisfy the Civil Service Commissioners that he is a natural-born subject of the Queen, that his age is within the prescribed limits, that he has no bodily infirmity unfitting him for the Civil Service, and that he is of good moral character.

The examination for the appointment of Abstractor in the Civil Service, which is classed under (1), is in handwriting, orthography, arithmetic (including Vulgar and Decimal Fractions), English composition, and digesting returns into summaries. The limit of age is 20 to 25, and the fee is ten shillings. Boy-clerks as candidates must be between 15 and 17 years of age. They are classed under (2), and are examined in handwriting, orthography, arithmetic (including Vulgar and Decimal Fractions), copying MS. to test accuracy, English composition, and geography. The fee is ten shillings. Temporary boy-copyists must be between 14 and 18 years of age, and are examined in handwriting, orthography, and elementary arithmetic. The fee is one shilling. Temporary boy-messengers must be between 13 and 15 years of age, and are examined in reading and writing. The fee is one shilling. Female typists are classed under (3) and (4), and are examined in writing, spelling, arithmetic (first four rules, simple and compound, including English weights and measures, and reduction), and typewriting. The candidates must be between 18 and 30 years of age. The fee is one shilling.

For fuller information concerning the above and other examinations held in connection with the Civil Services of the United Kingdom and India the reader is referred to the handbook of rules and regulations issued by the Civil Service Commissioners. These rules and regulations are liable to alteration from time to time, but from the above details the reader may form a tolerably accurate idea of the method, scope, restrictions, &c., of the examinations, as the variations, if any occur, are usually slight.

In 1889 it was provided by the rules and regulations applicable to the Indian Civil Service that *selected* candidates, who have passed the competitive examination, before proceeding to India should be on probation for one year, at the end of which time they should be examined with a view of testing their progress in Indian law, the Vernacular of the province to which each is assigned, History of British India, and certain optional subjects. The candidates are also tested as to their ability to ride, which is obligatory, and if they pass the final examination they receive £100 as allowance for residence during their probation at one of the Universities or Colleges approved by the Secretary of State, viz., Oxford, Cambridge, Dublin, Glasgow, Edinburgh, St. Andrews, Aberdeen, and University and King's Colleges, London.

The Royal Indian Engineering College at Cooper's Hill, Staines, was established in 1870, with a view to the education of civil engineers for this department. Admission is obtained by competitive examination, to which all natural-born British subjects between the ages of seventeen and twenty-one, on the 1st day of July, and of sound constitution and good character, are eligible. There are also competitive examinations in connection with valuable appointments in the Forest Service of India (limit of age, 17-20; fee, London, £2—elsewhere, £3), and in the Crown colonies: also in the Indian Police Service (unmarried, British-born or naturalised British subject, and between 19 and 21 years of age; fee, London, £2; elsewhere, £3.

Exam'ined Copy, in English law, is a copy or extract of a deed or entry in the record certified by the proper officer. With regard to the admissibility of C. in evidence, see *Taylor on Evidence*, s. 1323. The analogous term in Scotch law is Extract (q.v.).

Exanthem'ata (Gr. lit. 'blossoms,' 'what burst forth,' then 'eruptions,' from *exantheō*, 'I burst forth as a flower'), a class of febrile diseases, attended by eruptions on the skin, which appear at a definite period and run a definite course. The E., or eruptive fevers, belong to the miasmatic order of zymotic diseases, and are small-pox, chicken-pox or varicella, miliary fever, scarlet fever, hybrid of measles and scarlet fever, rubeola, dengue, erysipelas, and plague.

Ex'arch (Gr. *exarchos*, 'a leader'), a title which was at first given to the leader of the chorus in a Greek play, was afterwards conferred on bishops in the Greek Church, and is now applied to a deputy of a patriarch in the Russian Greek Church. Under the Byzantine empire the governor of a border province was called an E. When Narses, the general of Justinian, destroyed the Ostrogothic kingdom in Italy, he ruled that country as an *exarchate* of the Byzantine empire until his death in 567. The Bishop of Rome and the *duces* or rulers of the various Italian provinces soon made themselves independent of the exarchate, which became confined to the districts round Ravenna, and remained subject to the Eastern empire until Aistulf, king of the Lombards, took Ravenna in 752. Another exarchate was founded in Africa in 534, and was abolished by the Arabs in 698.

Excam'bion is, in Scotch law, the name of the contract by which one piece of land is exchanged for another. The implied Warrandice (q.v.) of this contract is real warrandice, in virtue of which either party in the event of eviction from the land which he has received in E. may recover the land which he gave in exchange. The portions exchanged must not be more than one-fourth of the value of the estate, and they must not include the principal mansion, house, garden, park, or home farm. In English law, see Exchange, Deed of.

Ex'cellence, or **Ex'cellency**, a title first borne by the Lombardic, then by the Frankish kings, and by the German emperors till the 14th c. The Italian princes used it in the 15th c., but from the 17th exchanged it for *Altezza* ('highness,' Fr. *Altesse*). It has since become in most countries the designation of ambassadors; but in Italy the title *Eccelenza*, though properly belonging only to noblemen, is given by courtesy to every stranger to whom it is sought to show civility. The governors of British colonies are addressed by the title of E., as are some of the military commanders.

Exceptions, Bill of. In England, if the counsel for either party at the hearing or determining of a cause held that the judge mistook the law in his directions to the jury, or in withholding from them, or admitting, evidence, &c., he might require the judge publicly to seal a B. of E., stating the point in which he was supposed to err. This the judge was obliged to seal, or if he refused, the party might have a compulsory writ against him. The question of law in dispute was then determined in a Court of Error. The Judicature Act of 1875 did away with the procedure, and left to either party dissatisfied with the ruling of the judge on a question of law, the right to move in the High Court of Justice or in the Court of Appeal, and provided 'that nothing in the Act or in any rule should prejudice the right of any party to any action to have the issues for trial by jury submitted and left by the judge to the jury.' When jury-trial in civil causes was extended to Scotland, it having been deemed proper to adopt sundry English law terms and forms, amongst others Bills of E. were introduced, the form being prescribed in the Appendix to the Acts of Sederunt, 9th December and 3rd July, 1823.

Exchange', the name given in the great commercial cities of Britain to the institution where merchants, bankers, and stock-brokers meet for the transaction of business, or to obtain intelligence respecting the value of stock, &c. The institution, known as the *Bourse* (Lat. *bursa*, 'purse') in France and Belgium, the *Börse* in Hamburg and other German cities, the *Borsa* in Italy, is of foreign origin. Sir Thomas Gresham, who had long acted as British agent at Antwerp, resolved to reproduce the Bourse of that city in England. Gresham's Burse, as the new building was called, was commenced in 1566, finished in the following year, and inaugurated by Queen Elizabeth (23rd January, 1570-71), under the title of 'The Royal E.' This building was destroyed by the great fire of 1666. It was replaced by a new E. in 1669, which was also destroyed by fire in 1838. The present London E. was built in 1842-45, at the cost of £150,000, and inaugurated by Queen Victoria on the first day of the latter year as 'The Royal E.' The business carried on 'on 'Change' consists of buying and selling merchandise, and paying, receiving, and exchanging money. After that of London may be mentioned, in Great Britain, those of Birmingham and Glasgow. The Bourse of Paris, that of Berlin, and the E. of New York are remarkable for their elegant architecture.

Exchange, in political economy, means the conversion of the money of one country into the money of another. *Rate of E.* means the price at which the conversion can be effected. This rate fluctuates according to the Balance of Trade (q.v.), it being in favour of that country owing least to the other. Thus, if England owes twenty millions of pounds to the United States, while the latter country owes England thirty millions, E. will be in favour of England; that is to say, if a resident in the United States wishes to convert a certain weight of gold or silver in American coin into British coin, he will receive less weight in British coin; while the resident in London who converts British into American coin will receive more weight than he gives. When E. is weight for weight, then it is said to be *at par*. Between England and France *par* is 25·2 francs per £1. If A of London owes B of Paris £100, and B owes C of London £100, the whole may be adjusted without transmission of bullion by A paying C £100. But if Paris owes London five millions of pounds, while London owes Paris only four millions, it is plain that the whole relative debt cannot be extinguished in this convenient way, and there must be the trouble and expense of transmitting bullion. The fact that Paris owes more to London than London to Paris causes a greater competition among Parisians for orders payable in London than there is in London for orders payable in Paris; E. will therefore be against Paris.

Exchange, Deed of, in English law, is a deed by which one owner of land exchanges land with another. The portions exchanged must be of equal value, and the legal tenure must be equal. Thus estates held in fee-simple cannot be exchanged for estates held in fee-tail. (See FEE-SIMPLE.) By 4 & 5 Will. IV. c. 30, the proprietor of any land in *common field* may exchange it for any other land, whether lying in the same or in another common field, or for any enclosed land lying in the same or in an adjoining parish. E., according to Statute 8 & 9 Vict. c. 106, no longer implies right of re-entry or general warranty, but an actual entry is absolutely necessary to complete the E., as the heir of a deceased party, who has never entered, cannot enter and take as purchaser. The General Inclosure Act of 1836, and the Settled Land Act of 1882, provide for E. of lands within the same parish, and of settled for other lands by a tenant for life. For the exchange of land held in right of the Church the consent of the patron and of the bishop is necessary.

Exchange, Military. By the Act 5 & 6 Edw. VI. c. 16, it was declared that all sales, or bargains for money or reward, of or about offices in the administration of justice or in the civil service, &c., should be void, and the intending seller should lose all right to the office, and the intending buyer should be disabled for ever from acquiring. By the Act 49 Geo. III. c. 126, this Act was extended to all offices in the gift of the Crown, and was also extended to Scotland and Ireland. There were, however, excepted from this Act all *purchases* or *exchanges* of commissions in the royal forces at prices fixed by his Majesty's regulations. Any one giving or taking more than the regulation price was to forfeit his commission and to be cashiered. These Acts are known as the Army Brokerage Acts. In 1683 a royal warrant ordered the payment of one shilling in the pound on the surrender of a commission to the person surrendering. William III. forbade all payments, and exacted an oath from all officers that they had given no money. This rule was omitted from the Mutiny Act of 1701; and gradually purchase, recognised by the Court of Chancery, grew up into a system. The subject was often dealt with by committees, but it was impossible to make overpayments cease, because the permission to buy led to the practice of bargaining. Hence in 1871, when Mr. Gladstone's government failed to carry their bill abolishing purchase, they abolished it by royal warrant, dated 20th July, 1871. The method of abolition was by cancelling all royal regulation of the prices at which purchases or exchanges were alone lawful. The regulations now require, as regards first appointments, a certain standard of examination; as regards promotion, a certain term of satisfactory service, and in most cases further examination. It was provided that officers of equal substantive rank on full pay may exchange from one regiment or corps to another with the sanction of the commander-in-chief, and on a certificate from their superior officer that the E. does not originate in any cause affecting the character or efficiency of the parties, and on a medical certificate of fitness to serve, no officer being permitted to retire within twelve months of his E. It was explained that the warrant did not intend to interpose any obstacle in the way of exchanges between officers on full pay which are made to suit the reasonable convenience of officers. By the Act 38 Vict. c. 16 (1875), it is provided that her Majesty may authorise exchanges from one regiment or corps to another, *on such conditions as may seem expedient for the time.* The chief points that arise in reference to an E. are the reasons for the exchange and the manner in which it is carried out. Both *receiver* and *payer* are compelled by the regulations now in force to sign declarations that the proposed E. does not originate in any cause affecting the honour, character, or professional efficiency of either party, that they intend, *bonâ fide*, to join and serve in, for at least twelve months, the regiments to which they exchange, and that not one of the officers of either regiment has contributed or promised to contribute to the sum arranged as payment for the E., or has paid, or promised to pay, any sum of money to either or for either of them (the Exchangers) in reference to the E.

Exchange, Stock. In former times the business now carried on in the S. E. of London was transacted in the Bank of England; but about the year 1700 the dealers in public securities changed their place of meeting to what is now called *Change Alley.* In 1773 some of the brokers hired rooms for business purposes in Sweeting Alley. To these they gave the name of *S. E.* Subscriptions were subsequently raised to erect a building for the special purpose of dealing in stocks. The site chosen was Capel Court, so called after William Capel, Lord Mayor of London, who had resided there. Admission to the society of the brokers, which had formerly been free, was now appointed to be by ballot and subscription. The old building was removed and the present one opened in 1854. Members are governed by a committee, who have power to suspend or expel any member 'guilty of dishonourable or disgraceful conduct.' A member is not allowed to transact business with any one who is not a member, and all transactions must be according to the custom of 'the house.' 'Settling days' are, for consols, once a month, on a day between the 6th and the 11th; for other English and foreign stocks twice a month, about the middle and the end. Members of the S. E. are either 'jobbers' or 'brokers.' A jobber deals on his own account. A broker acts for a client, deals with the jobber, and is paid by commission. A 'bull' buys for settlement at a future date on the speculation of a rise in price in the interval. A 'bear' sells for future settlement, on the speculation of a fall in price in the interval. Hence what are called *bull* transactions and *bear* transactions are speculations for the 'rise' or 'fall' of stocks. 'Contango' is a payment for postponing settlement of a bull transaction from the original settling day to the next. It is the interest on the purchase-money for the time between the settling days. It is paid either to the seller of the stock, who agrees to wait a fortnight for his money, or it is paid to some one who lends the money to the bull. It thus often happens that the bear gets contango on the purchase-money on stock which he has not. If money is dear and stock plentiful, the contango rate is high. When conditions are reversed, as they often are from bear transactions, then the bear, instead of receiving contango from the bull, has to pay for not being required to deliver the stock sold. This payment is called a 'backwardation.' What is called the 'making-up' price of stocks is their average prices during the day, and the difference between this and the prices at which business is actually done is received and paid by the bulls and bears, or accounts are carried over on this principle. Such is the nature of what are called *time bargains.* PUTTS AND REFUSALS, or contracts for the sale of supposed stock on a day not arrived, were rendered illegal by statute 7 Geo. II. c. 8, which, however, was repealed by statute 23 & 24 Vict. c. 28.

Scrip—an abbreviation of subscription—is the document which certifies payment of deposits and calls on shares previous to the issue of the final certificate. It is negotiable.

Excheq'uer Bills are bills of credit issued (generally by authority of Act of Parliament) by the Exchequer, and pledging the Government to repay the sum advanced with usual interest, generally 1½ to 2½ *per diem* per £100. Those issued by statutory authority are charged on the Consolidated Fund. By such bills the bank advances to Government are made. E. B. and Exchequer Bonds constitute the bulk of the unfunded debt. Public notice is given from time to time for repayment. Bankers prefer this security, because its value does not fluctuate. Statute 29 & 30 Vict. c. 25 consolidated the laws under which the issue, payment, &c., of E. B. and E. Bonds have been regulated. Statutes 24 & 25 Vict. c. 98, 29 & 30 Vict. c. 25, and 36 & 37 Vict. c. 54, provide for the punishment of forgery of E. B.

Exchequer Bonds differ in being issued at fixed rates of interest for considerable terms of years.

Exchequer, Chancellor of, was at first the head of the clerks of the royal chapel, after they were formed, in the reign of Henry III., into a court which had both judicial and financial functions, and which as a financial body was called the *Court of the Exchequer*. It became solely judicial, but the C. of E. remained a financial minister, and is now the first minister of finance in the British Government. The Prime Minister, if he be a member of the Commons, can hold the office.

Exchequer, Court of. See COMMON LAW, COURTS OF; COURT OF JUDICATURE, SUPREME, ACTS.

Exchequer, Court of, in Scotland. The Scots C. of E. prior to the Union was the King's Chamberlain-Court, and consisted of the treasurer, the treasurer-depute, and as many lords of Exchequer as the king chose to appoint. By the Treaty of Union the court was continued until Parliament should constitute a new one, which was done by 6 Anne, c. 26. This court consisted of the Lord High Treasurer of Great Britain and a Chief Baron, with four other Barons of the Exchequer (the last being serjeants-at-law, English barristers, or Scots advocates of five years' standing). In 1833 their ministerial duties passed to the Treasury, and in 1856 their judicial authority was transferred to the Court of Session. The Crown is still preferred to other creditors, and the duties in connection with the revenue, as formerly belonging to the sheriff and justices, remain as they were under the statute of Anne.

Excip'ients (from Lat. *excipio*, 'I take out' or 'receive,' *i.e.*, along with something else), in materia medica, are inert or slightly active substances used as a medium of administration for active medicines, such as rose-water, mucilage, and syrups.

Excise' Laws. The taxes levied upon articles of consumption produced within the kingdom are called Excise Duties. They were first resorted to as a temporary expedient by the Long Parliament. They have ever since continued to be an important source of the imperial revenue of Great Britain. In 1733 Sir Robert Walpole introduced a bill for extending the operation of the excise, while at the same time it diminished its pressure by the Bonding or Warehousing System (q.v.), under which the taxed commodity may be locked in a Government warehouse and removed in instalments, a proportional part of the duty being paid at each removal. The scheme was, however, then defeated. It was not brought forward again till 1802, when it became law. The collection and management of the excise were placed under special commissioners, but in 1849 they were transferred to the Board of Inland Revenue, which appoints collectors, accountants, and other subordinate officers. The levying of the revenue is facilitated in England and Wales by the division of the counties into districts of collection, with subdivisions of each district, each subdivision having a supervisor with a gauger or surveying officer. The excise duties are increased by the duties on licenses. Those within the limits of the chief office in London are granted by the Commissioners of Inland Revenue, or by persons employed by them for the purpose. Within the limits of the cities of Edinburgh and Dublin licenses are granted by the commissioners or assistant-commissioners there, elsewhere by the collectors and supervisors of the respective excise collections. Upon death or removal, a license may be transferred by endorsement for the residue of the term, but a fresh entry must be made of the premises. The penalties attached to the sale of excisable commodities without a license are heavy, in some cases amounting to £500. These commodities are beer, cider and perry, chicory, coffee mixtures or substitutes, game, patent medicines, plate, playing cards, spirits, tobacco and snuff, vinegar, wine, &c. Besides these sources of revenue, there are also licenses to appraisers, auctioneers, brewers; possessors of dogs, armorial bearings, carriages, male servants, &c.; hawkers, carriers of guns, pawnbrokers, &c. The total revenue derived from excise was, for the year ending 31st March, 1895, £26,050,000; and the cost to the country of the Inland Revenue Department, which collects the excise amongst other items of revenue, was for the same period £1,804,539 (net).

Excommunica'tion is the banishment of a member from the privileges of a religious community on account of impiety or other conduct inconsistent with the rules of the society. The first express mention of it among the Jews is in Ezra x. 7, 8, and Neh. xiii. 3. In later Rabbinical writings three degrees of E. are distinguished:—(1) *Nidui*, involving certain privations in civil and religious matters for thirty days. This was probably the 'casting out of the synagogue' mentioned Luke vi. 22, John ix. 22 and xvi. 2. (2) *Cherem*, a more severe exclusion, prohibiting the offender from buying and selling, and including a curse or *anathema* (in the LXX. the Greek equivalent for Hebrew *cherem*, 'devoted,' *i.e.*, to destruction; in the New Testament rendered 'accursed,' *e.g.*, Rom. ix. 3, 1 Cor. xii. 3, Gal. i. 8, 9, that is, a sentence signifying danger of death). (3) *Shammatha*, by which an offender was given over totally and finally to the divine judgment. This is supposed to be the same curse as that pronounced by St. Paul, 1 Cor. xvi. 22,—*Anathema Maranatha*. The latter word is the Hebrew form of the Aramaic for 'the (or "our") Lord will come,' and was part of a cursing formula from the Book of Enoch—*cf.* Jude 14-16, and 2 Thess. i. 7-10.

E. was adopted in the Christian Church as a part of her discipline for preserving the unity and purity of her members, and consisted in excluding from the common benefits and privileges consequent on baptism until signs of repentance were shown. There were two degrees of the infliction, according to the heinousness of the offence committed:—(1) By the Lesser E. (called 'separation' or 'suspension'), inflicted for such offences as being absent from church on three successive Sundays, ante-nuptial incontinence, marrying a third time, &c., offenders were excluded from the Eucharist, the prayers of the faithful, and from offering oblations. (2) The Greater E., inflicted for the greater sins of fraud, apostasy, blasphemy, murder, idolatry, &c., was total expulsion from the Church with an anathema or curse, and deprived the offender of Christian burial. At first the power claimed by the Church in this matter was entirely spiritual. While she excluded offenders from spiritual privileges, she left all their civil or natural rights unaffected, and so it always remained to a great extent except in Europe. Mosheim ascribes the greater severity of the sentence of E., which came into vogue in Europe, to the influence of paganism. Those excommunicated by the Druidical priests, for example, were counted criminals, were shunned as if infected by the plague, and deprived even of the protection of the laws (Cæsar, *De Bell. Gall.*, vi. 13). So from the 8th c. onward in Europe a person excluded from the Church by a bishop, and especially by the Pope, was no longer regarded as a king or a lord, nor as a citizen, a husband, a father, or even as a man, but was considered a beast. Three gradations of guilt, in those liable to ecclesiastical censure, were established by the Council of Pavia (850). The first included those who willingly confessed their sins and submitted to the penance imposed; the second, those who for greater sins were excommunicated, but who submitted to the penance imposed, and were then restored to communion; the third, those who refused to submit to the penance imposed, and were in consequence anathematised, a sentence which excluded them not only from the Church, but from the society of Christians; in other words, they were outlawed. The sentence of E. was inflicted on a king for the first time by Pope Gregory V.—on Robert of France, 889. But Pope Gregory VII. was the first to carry out the full severity of the sentence described above—in the case of Heinrich IV., Emperor of Germany. The practice of laying whole nations under sentence of E. or an 'interdict' dates from the time of the same pope, or, according to others, of Alexander III., about 1160. The most illustrious princes of the Middle Ages were obliged to succumb to the effects of an interdict, but some time before the Reformation the terror of such a sentence was in great measure dissipated. From that time the effect of E. has been again, practically at least, entirely confined to spiritual matters.

Excoria'tion (Lat. *ex* and *corium*, 'the skin'), a part of the skin from which the cuticle has been removed by friction, heat, or the action of some acrid substance. Excoriations are common among infants, and may be cured by dusting flour, starch, or puff-powder, or oxide of zinc over the parts.

Excre'tion (from Lat. *excerno*, 'I separate'). This is the process by which refuse materials are thrown out of the body. These materials come from two sources—(1) The matters in food which are incapable of digestion or of assimilation, and which are ejected from the alimentary canal; and (2) matters formed by the disintegration of the tissues in consequence of their vital activity. Both of these kinds of materials, being not only useless but injurious, are thrown out of the body by various organs and channels. The channels of E. are—(1) *The lungs*, which separate watery vapour, carbonic acid, and a small amount of refuse organic matters which give frequently a taint to the breath. (2) *The liver*, which separates water, holding in solution, in the form of bile, various hydrocarbons, such as taurocholic and glycocholic acids, cholesterine, colouring matters, leucin, tyrosin, and other matters obtained from the disintegration of the tissues, and various salts, such as sulphates, phosphates, and chlorides of the alkalies and alkaline earths, and as a separate product, glycogen or animal starch. (3) *The kidney*, which separates nitrogenous matters, such as urea, uric acid, creatine, creatinine, &c., colouring matters, salts of various kinds, namely, the sulphates of soda, potash, and lime, the phosphates of soda, magnesia, and ammonia, and the chlorides of sodium and potassium. (4) *The skin*, which separates oily matter from the sebaceous glands, and sweat from the sweat glands, consisting of water holding in solution a small quantity of the salts of soda, potash, and lime, and occasionally urea, uric acid, grape sugar, albumen, and biliary colouring matters. (5) *The intestinal canal*, which discharges the fæces consisting of the refuse material of food along with a small amount of the constituents of the bile, mucus, fatty matter, &c.

Exculpa'tion, Letters of, were, in Scotch law, a warrant granted at the suit of the panel or defender in a criminal prosecution, for citing and compelling the attendance of witnesses in proof either of his defence against the libel or of the validity of an objection against any juryman or witness. These letters were issued on application at the Justiciary Office, or in the case of sheriff-court libels, on application to the clerk of court. 'Evidence in exculpation may *now* be adduced without raising a special defence, or in support of such a defence, or in both ways.' The officers of the court undertake to cite the witnesses just as if they were to be called for the prosecution. Special rules are framed for each special defence.

Exe' (Cymric, *wysk*; hence Lat. *isca*; comp. Gael. *uisg*), an English river, rises in Exmoor, Somersetshire, and 19 miles from its source reaches Devonshire. After a further course of 35 miles in a southerly direction through Devonshire it falls into the English Channel at Exmouth Bar. The tideway is 5 miles long and 1 mile broad at high water, and by means of this and of a canal, formed in the reign of Henry VIII., but considerably lengthened since, vessels can get up to Exeter. See AXE and ESK.

Ex'ecuted and **Exec'utory,** in English law, are terms expressive of the different stages of a contract. Matter is *executory* regarding which there is a contract binding the possessor to transfer it to some one else. When the property is transferred, it is executed. Thus an executory estate is one created by deed, but which must afterwards be *executed* by entry, &c.

Execu'tion, Civil (English law). If the judgment is not appealed against, suspended or reversed, E.—that is, the enforcing of the sentence of the law—follows, and does so immediately, in ordinary cases under the Rules of the Supreme Court of 1883, Order 42. E. is of different kinds. If the plaintiff obtain a verdict awarding real estate to him, a writ is directed to the sheriff commanding him to give actual possession to the plaintiff, and the sheriff may break open doors if possession is not peaceably yielded; but if the property is quietly given up, symbolical delivery is sufficient. Executions in actions where money only is recovered may be entered against the goods and chattels of the defendant. Every writ of E. must be sued out within a year and a day after the judgment is entered, or renewed, otherwise the court concludes that the judgment is satisfied and extinct.

Execution, Civil (Scotch law), is an attestation by a Messenger-at-Arms (q.v.), or other officer of the law, that he has given the citation or executed the diligence in terms of his warrant for so doing. It corresponds to an affidavit of service of writ or summons in England. Two witnesses were formerly required in Scotland to executions, but one is now sufficient, except in cases of poinding, in which two are still required, or in small debt cases, where no attestation is required at all.

Execution, Criminal. See CAPITAL PUNISHMENT.

Execution, Military and Naval. See CAPITAL PUNISHMENT.

Execu'tioner, the person who carries into execution the last demand of the law by arranging and controlling the machinery for inflicting Capital Punishment (q.v.). Nominally this duty in the United Kingdom falls to be performed by the sheriff or by his deputy, but a deputy has always been employed. Before 1868 the hanging of a convicted criminal took place in public, but since the statute 31 Vict. c. 24 was passed, the execution has taken place within the prison walls and in the presence of the sheriff, gaoler, chaplain, and surgeon of the prison, and other officers of the prison whom the sheriff may require or allow. In England and in some other states the office was at one time hereditary, and it was only in 1861 that the last headsman of the Tower of London died. But if the lineage of the E. be subject to vicissitude, his name is generally long-lived, for a distinguished practitioner has in many instances handed it down to several successors. Frenchmen have for many generations spoken of the functionary who superintends executions in the capital as 'Monsieur de Paris'; while in England, Dryden (see *Epilogue to the Duke of Guise*) and popular habit have immortalised the name of Jack Ketch. In the reign of James I. the London E. was named Gregory Brandon, and long after his demise the name Gregory was the household word for the hangman. Brandon was an esquire in virtue of his office, having had the influence to obtain armorial bearings from the College of Heralds. With 'Squire Dun,' mentioned by the poet Butler, the gentry of the gallows became extinct; for we find that Jack Ketch, whose name has ever since been synonymous with hangman, was the next E. The very obvious moral to be derived from practising hanging as a profession does not always appear to have been perceived by its professors, for we find that on the 31st May, 1718, John Price, the London E., was himself executed for murder. Again, on 24th May, 1736, returning from Tyburn, where he had suspended five thieves, the London E., stubbornly sinning against the light, picked a woman's pocket of 3s. 6d.; and as that was about the amount for the theft of which, in those days, persons were condemned to death, there is ground for the hope that this E. in his own person illustrated the law which he had himself done so much to uphold. It is questionable whether in Scotland the business was followed by persons any more respectable, for in 1682 the Edinburgh hangman, Alexander Cockburn, was himself hanged for murder. Of Scottish executioners, John Dalgliesh is almost historical as the functionary who executed Wilson the smuggler in 1736, on which occasion Captain Porteous ordered his men to fire upon the crowd, an act which led to remarkable consequences. In 1784 John High or Heigh, convicted of stealing poultry, was offered the alternative of undergoing due punishment for his crime or accepting the post of Edinburgh E., and chose the latter. This official survived to 1817, and was succeeded by John Scot, who was assaulted and killed in 1847. The mitigations which have taken place in the criminal code within recent years, by limiting the class of offences for which the punishment of death is inflicted, have produced great changes with respect to the E. In London executions were performed by Calcraft till 1874, by Marwood till 1883, by Berry till 1889, then by Billington, though the last has not been specially retained. By the London E. all executions are performed in Scotland, and as a rule in the provinces of England, although in more than one district of England a local functionary is available. Sanson, the E. of Louis XVI., was the official employed in Paris on similar occasions for many years, and was succeeded by his son (see *Memoirs of the Sanson Family*, 1875). In the United States the sentence of death is carried out by the sheriff, assisted by the under-gaoler.

Execution of Deed. In England the formalities required to make a deed valid against the grantor are *signing*, *sealing*, and *delivering*. (See DELIVERY OF A DEED.) These again require to be verified by Attestation (q.v.). Delivery to the grantee renders a deed absolute. The E. of wills in England is by the testator signing or acknowledging his signature to the will in presence of two witnesses.

In Scotland E. of D. is by the grantor signing or owning his signature before two witnesses, who sign their names, writing after them the word *witness*. E. was verified by what is called the Testing Clause (q.v.), but by the Conveyancing Act of 1874 this clause has been dispensed with.

Exec'utive. See GOVERNMENT.

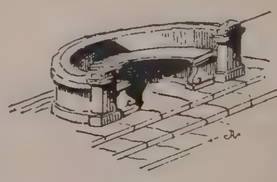
Exec'utor, in England, is the person to whom a testator commits the execution of his last will and testament. If the testator make a will without naming executors, or if he name incapable persons, or if the executors named refuse to act, the Court may appoint an administrator, whose duties are nearly the same as those of an E. The personal property of one deceased vests from the time of his death in his E. When a person dies intestate, the Probate, Divorce, and Admiralty Division of the Supreme Court will grant administration to the widow, children, or next of kin (if any). An E. may be appointed by words which are indirect. No one is bound to accept the office; but if he do any act of administration, he will be held to have accepted, and he cannot then renounce without sufficient cause. It is the duty of an E. or administrator to apply for probate of the will or for letters of administration within six months, and he incurs a penalty of £100 and £10 per cent. additional duty if he exceed that time. Neither will be granted until the probate duty has been paid on the full value of the deceased's personal property, including leasehold. After obtaining probate, an inventory must be made of the whole of the deceased's goods and chattels, which if required must be delivered on oath in presence of two credible witnesses. So delivered, no creditor can afterwards object to it. An E. must be careful as to the order in which he pays debts, as should he pay one kind of debt before another kind to which it is legally postponed, he will be personally liable in the event of a deficiency of assets.

In Scotland the office of E. is conferred either by the written nomination of the deceased, or, failing that, by decree of the Sheriff (q.v.); the E. in the former case being called an E.-nominate, and in the latter an E.-dative. In either case the E. must complete his title to administer by a judicial proceeding called a confirmation, without which he has no title to sue; nor is it safe for a debtor of the deceased to pay him. An E. should pay no debt of the deceased without the authority of a decree; and even when a decree is produced, he should pay no debt within six months after the death of the deceased, except what are called Privileged Debts (q.v.).

Executors, or heirs *in mobilibus*, are in Scotland the whole next of kin of one deceased, that is, all the nearest in degree of blood. They succeed *ab intestato* to equal portions of the moveable estate, without regard to primogeniture or sex. But when one of the next of kin is heir to the heritage, he is not entitled to share in the moveable succession, unless he choose to collate. (See COLLATION.) Formerly there was no right of representation regarding succession to moveable estate in Scotland. Thus children of one deceased excluded the grandchildren. But this has been changed by the Moveable Succession Act, yet only in the case of the predeceased. Representation is only permitted where some persons would have been the next-of-kin, if they had survived the intestate, and have predeceased him. In collateral succession full brothers and sisters exclude half; and if there be no descendants of an intestate, a father is entitled to one-half, the remainder being equally divided between brothers and sisters. If the father be dead, the mother takes one-third; and if there be no other surviving relatives, the other two-thirds go to the Crown.

Exec'utory Devise', in English law, is the term which denotes the devise of an interest which does not vest on the death of the testator, but the vesting of which is deferred or contingent. The law on this subject underwent much learned discussion regarding the will of Thellusson, an eminent London merchant. He died leaving three sons, to whom he left small legacies. The rest of his property, £4500 a year of real estate and £600,000 of personal property, he devised to trustees, to be accumulated during the lives of his three sons and of their sons. On the death of his last surviving grandson the accumulated fund was to be divided into three shares, one share to go to the eldest male lineal descendant of each of his three sons, with provision in case of failure. When Thellusson died he had three sons and four grandsons, two being born afterwards. Had the intention of the testator been carried out without litigation, it has been calculated that the fund would, when it came to be divided, have been over thirty-two millions of pounds. But the result was protracted and enormously expensive litigation. The judges in the House of Lords ultimately unanimously resolved that the will was legal. But to prevent repetition of the eccentricity, the Act 39 & 40 Geo. III. c. 98 was passed—which does not apply to Ireland—prohibiting any settlement of property for accumulation for more than twenty-one years after the death of the testator, or beyond the coming of age of any one entitled to the profits under the settlement.

Exedra, a term used in architecture to signify a semicircular bench resembling in shape those used by the philosophic schools in Greece and Rome. In Christian basilicæ an E. is placed on each side of the episcopal throne in the centre of the apse and raised some steps above the level of the floor. Priests used to sit on E. at official meetings. See *Art Dictionary*.



Exedra.

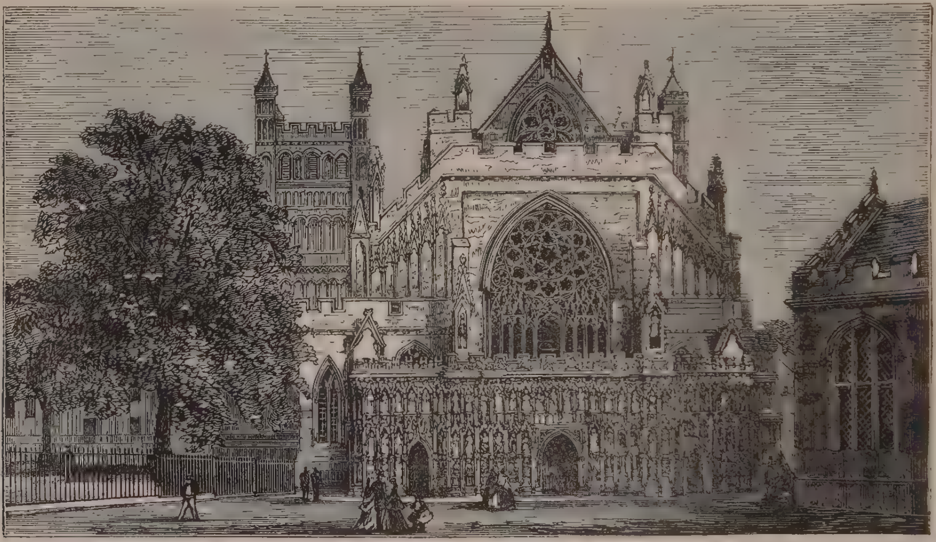
Exege'sis (Gr. from *exēgeomai*, 'I lead the way,' 'set forth,' 'explain'; used of diviners and priests) is the art or science of interpretation, or of discovering the true meaning intended to be conveyed by a writer, and is generally, although not necessarily, understood to refer to the Holy Scriptures, in which sense it is treated in the present article. The relation of E. to Hermeneutics is that of practice to theory. The task the exegete or interpreter has to perform is to explain the sense of what is written, so that others, as far as possible, may think the same that the writer or speaker intended they should think. And since, in order to properly accomplish this task, he must first understand what he is to explain, he must first overcome all the difficulties that lie in the way of his doing so—difficulties arising from: (1) the language in which the books are written; (2) the subjects of which they treat; and (3) his own preconceived notions and prejudices. 1. For the first there is required a thorough knowledge of the languages used—Hebrew and Greek—in their words, idioms, and figures: *grammatical* interpretation. 2. For the second, a knowledge of various subjects and sciences—*e.g.*, history, geography, chronology, antiquities, astronomy, geology, &c.—in order to place what is written in the light of the age from which it is descended, as thus only can the writer's meaning be known: *historical* interpretation. 3. The interpreter must consider the passage in connection with the writer's general way of thinking and of viewing matters, in order to illustrate thereby what has been ascertained by grammatical and historical means: this has been called *dogmatical* interpretation. Such are the true principles of E., but various other methods have been followed, which may be briefly noticed. Perhaps the most remarkable, as it is the earliest, is the allegorical. Allegorical E. is the system of explaining as allegorical what is not allegory, of giving to words a secondary, mediate, and mystical sense in addition to their primary, direct, and literal sense, retaining the latter merely as a veil to the former. Allegorical interpretation was very common among all the nations of the East. For example, when the Greeks began to feel that the mythical stories about their deities were too gross to be understood literally, their philosophers ingeniously discovered in the descriptions of the poets 'ideas less revolting to virtue and more worthy of the gods themselves.' The custom existed also among the Jews, especially those residing in Egypt. The *Therapeutæ* rejected the literal sense of Scripture altogether. Philo, who expounded the Pentateuch in the light of the Neo-Platonic philosophy, did not deny the reality of the literal sense, but represented Moses as having an exoteric doctrine for the illiterate and an esoteric for the cultivated, who are able to reach the secret spiritual sense of his writings. Among the Jews of Palestine also the same desire appeared to remove in the same way everything objectionable in the Bible. In the oldest Rabbinical writings the same distinction is made between the *body* and the *soul* of the text. The same method was pursued by almost all the Christian fathers down to the 7th c. One of them, Justin Martyr, alludes to three of the four senses of Scripture mentioned by many of the succeeding fathers—namely the *literal*, the *allegorical*, and the *tropological;* and of the fourth, the *anagogical*, according to which accounts of things in this life are applied to spiritual and heavenly things, many examples occur in his writings. The principles of E. followed by the Alexandrian school of divines, at the head of whom stands Clement, was connected with their theology. They made a distinction between *pistis*, an immediate reception of the truth without proof, and *gnōsis*, a complete view of the truth, by means of which the object of faith becomes a firm and sure possession. By this distinction, and the separation of Christians into *pistoi* (believing) and *gnōstikoi* (discerning), the latter came to be regarded as possessed of a divine qualification, by virtue of which alone all revelation could be expounded. Further, it is the allegorical sense of Scripture which leads to the *gnōsis*, while the *pistis* alone is produced by, and can understand only, the literal sense. Clement also makes mention of 'a rule of truth,' that is, a tradition or principle of E. About the beginning of the 6th c., a practice took its rise of making extracts from the commentaries of preceding fathers. When the annotations of several writers upon one book of Scripture were collected and arranged in succession, it was called a *chain*, Lat. *catena*. The custom soon became general with the decline of sacred literature; the very practice itself, which took for granted that everything connected with the interpretation of the Bible was anticipated and exhausted, being a sign of degeneracy; and a great many of the subsequent commentators were merely compilers of catenæ. A new era in the history of E. was initiated by the paraphrases and annotations on books of the New Testament of Erasmus, whose E. was to a great extent the guide of the Reformers, and whose 'great object was to ascertain what the words of Scripture were designed to express, without pursuing the far-fetched senses among which the schoolmen and mystics loved to lose themselves.' Since the Reformation E. has not run into the same excesses as before, but nevertheless various arbitrary and unwarrantable systems have been followed. (1) The Mystic, a modification of the old allegorical system, which has always found favour among a certain class of Protestants as well as Roman Catholics. According to this system, of which there have been various phases, a mystic, spiritual, mediate, or sub-sense is sought for when the literal is thought not to be subservient to morality. (2) The Pietistic, in which the regulating principle is an inward light, somewhat analogous to the ancient *gnōsis*, which guides to a true faith and a pure morality. This inspiration furnishes explanations without scientific investigation; hence the feelings rather than the understanding are consulted and followed. (3) The Moral, a mode of E. which was advocated by Kant, and which consists 'in educing from Scripture such ideas alone as are conformable to the pure principles of practical morality implanted in the bosoms of men.' 'The historical part of the Scriptures, which contributes nothing to make men better, is purely indifferent.' (4) The Historico-Psychological, chiefly developed by Paulus and Eichhorn, according to which everything—in the Gospel narratives, *e.g.*—is explained quite naturally, that is, all the miracles, when disentangled from the misconceptions of the narrators, and divested of all subsequent accretions, are explained as actual facts within the limits of the general laws of nature. (5) According to the Accommodation theory, usually associated with Semler, Jesus and the apostles accommodated themselves to the erroneous opinions of the Jews so far as was thought necessary or useful for the reception of the doctrines inculcated. (6) According to the Mythical system, which was followed by Strauss in his *Leben Jesu*, portions of the historical accounts of the Evangelists, especially those containing miracles, are to be regarded as mere myths, although the Evangelists themselves intended to relate history. (7) In the Rationalistic system, an external standard is set up to which Scripture must bend. It proceeds on the assumption that the sacred books should be subjected to the same treatment as, *e.g.*, the Greek and Roman classics, and that what is contradictory to reason is to be discarded.

Ex'elmans, or **Ex'celmans, Remy Joseph Isidore, Comte,** Marshal and Peer of France, born at Bar-le-Duc, 13th November, 1775, entered the French army in his sixteenth year, distinguished himself at the capture of Naples (1799), and served as aide-de-camp to Murat in 1801. After Eylau he was appointed brigadier-general; in 1808 he cooperated with Murat in Spain, where he was taken prisoner, and sent to England. Regaining his freedom after three years' captivity, he rejoined the French army. He fought with distinction throughout the Russian campaign, was appointed general of division, and received the decoration of the Legion of Honour in 1813. Proscribed after the fall of Napoleon, he lived in exile until the July revolution of 1830, after which Louis Philippe named him Grand Cross of the Legion of Honour and Peer of France. He was one of the first adherents of Louis Napoleon, who created him Marshal of France in 1851. E. died on the 21st July, 1852, from the effects of a fall from his horse.

Exemplifica'tion of Letters Patent is a copy or transcript of the letters patent made from the enrolment, and sealed with the Great Seal of England. In legal force the E. is equivalent to the letters.

Ex'ercise, Physiolog'ical Ac'tion of. E., either mental or muscular, if not pushed beyond a certain limit, cannot fail in being beneficial to the economy of the body. Moderate E. increases the nutrition of both the muscular and nervous systems, and so makes them stronger and more fit for a certain amount of work. The effect of such E. is seen in the well-developed muscles of the artisan, or in the quickness of perception and of volition in the active brain of the man accustomed to mental work. Moderate E. also increases the action of the heart. The muscular movements, for example, made in active walking drive, by pressure on the veins, more blood to the heart. This organ consequently beats faster, and sends more blood to the lungs and to the system than it would otherwise have done in a more lethargic state of the circulation. Hence, muscular activity improves the nutrition, and consequently the whole tone and power of work of the body. The effect of excessive E. is to produce fatigue and a feeling of great nervous depression.

Exe'ter (Old Eng. *Exanceastre*, 'the town on the Exe' (q.v.); the Roman *Isca*, and the *Caer-Isc* of the Britons), a city of England, the capital of Devonshire, lies picturesquely on a height overlooking the Exe, 9 miles from the sea, and 75 S.W. of Bristol by railway. It is in part well built, and has some fine squares and gardens. The see of a bishop, E. has a Norman-Gothic cathedral (1112-1369), with a length of 383 feet and 35,370 feet of area. Its W. façade is one of the finest in England, and it has a magnificent organ, a canopy over the bishop's chair, 53 feet high, the parts of which are dovetailed into each other, and a bell, the 'Great Tom of E.,' weighing 12,500 lbs. The cathedral was opened 18th October, 1877, after a restoration which cost nearly £50,000. E. also has a bishop's palace, a guildhall of 1593, restored in 1684, an Albert Memorial Museum (1868), a theatre, &c. There is a dock 917 feet long, 90 to 110 feet broad, and 18 feet deep, connected by a navigable canal (5 miles in length) with the lower part of the Exe, by means of which it has considerable trade by sea. The city has manufactures of paper, beer, gloves, lace, castings, &c. The lace is especially beautiful. E. was in existence when the Romans conquered the island, and was called by them *Isca Damnoniorum*, and from that day to this it has been uninterruptedly occupied. Roman remains—coins, bronze statues, penates, tesselated pavements, &c.—have been found in the neighbourhood, and beneath the old walls. It was the scene of many a fierce siege by the English, Danes, and Cornish Britons. Æthelstan founded an abbey here in 932, and E. soon after had so many religious buildings that it was called 'Monk Town.' In the time of Harold it was held by his mother Gytha, and was stormed by William the Conqueror in 1068, who built a castle, called by its Norman occupiers *Rougemont* ('red mount'), which completely commanded the city. In the civil war of the 12th c. it was held for Maud by the Earl of Devon, and was besieged for two months by the troops of Stephen. In 1537 Henry VIII. made E. a county by itself. Queen Elizabeth conferred on it the title of *semper fidelis*. It was Royalist during the Puritan struggle, and was for a time the headquarters of Charles's forces in the W. of England. The parl. bor. returns one member, and consists of the city and county of Exeter, and parts of the parishes of Heavitree, St. Thomas the Apostle, Topsham, and Alphington. Pop. parl. bor. 50,573; reg. dist. 37,568; county bor. 37,404; and diocese 629,009.



Exeter Cathedral.

Exeter College, Oxford, founded in 1314 by Walter de Stapledon, Bishop of Exeter, and sometime Lord High Treasurer of England, for a rector and twelve fellows, which is the number at the present day, although three of them are suspended. Twenty-five scholarships have been founded; of these eight (Stapledon) are limited to persons born or educated in the old diocese of Exeter; one or more (King Charles I.) are limited to persons born in the Channel Islands or educated at Victoria College, Jersey, or at Elizabeth College, Guernsey. The others are open, and four of them are awarded for mathematical proficiency. The Stapledon Scholarships are valued at not less than £60 per annum, the rest at £80; the former may be thrown open in the case of no candidates from Exeter and the Channel Isles. There are twelve exhibitions in the gift of the college. The college has the patronage of nine livings. The number of undergraduates is 158, while the college has 541 members of Convocation, and 858 on the books.

Exeter Hall, a fine building in the Strand, London, capable of holding 5000 persons in its auditorium. In former years it used to be let for concerts, public meetings, &c., but in 1880 the Young Men's Christian Association purchased it and it is now the property of that Society, which lets it also for religious meetings.

Exhaus'tions, Method of, a geometrical method employed by the ancient mathematicians, which may be looked upon as anticipating the principles upon which the differential calculus is founded. It was the method by which Archimedes squared the parabola, and discovered his famous theorems of the sphere and cylinder; and it depended upon the assumption that a curved line may be regarded as the limit of the circumscribing and inscribing polygons as the number of the sides is increased, and therefore the size of each side diminished.

Exhibi′tion, a term of Scotch law applied to an action for compelling production or delivery of writings. See DILIGENCE.

Exhibitions, Art. See ART EXHIBITIONS.

Exhibitions, Indus′trial, are collections of industrial products and manufactures exhibited, generally for a limited period, by different manufacturers and producers, with the view of showing the nature of their calling or the perfection of their manufactures. Some are merely local, and confined to the peculiar products and manufactures of the district in which they are held. Others are devoted to special branches of industry, the 'exhibits' in which are not necessarily confined to any example. A third class is universal in its scope, and aims at nothing less than illustrating the natural products, processes of manufacture, and finished articles of the entire world. Indeed, the later E. of this third class have been even more ambitious still, and in addition to illustrating the industry of the world, they have attempted to bring together representations of the fine arts, archæology, social condition, habits, and religious practices of all mankind. The parent of all the I. E. of modern times was one projected by the Marquis d'Avèze, and opened in 1798 in the Maison d'Orsay. The second exhibition was held in 1801, under the patronage of Napoleon as First Consul. The number of exhibitors, meantime, had increased from 110 to 229. From this period onwards E. came to be of frequent occurrence in Paris and the French provinces, and they gradually extended to every state of Europe. It was not till 1828 that an industrial exhibition was attempted in London, but in that year an organization selected from mechanics' institutes throughout the country, under the presidency of Dr. Birkbeck, instituted an exhibition in London under the lengthy title of 'The National Repository for the Exhibition of Specimens of New and Improved Productions of the Artisans and Manufacturers of the United Kingdom, Royal Mews, Charing Cross.' At a later period the Society of Arts held annual E. of the new inventions and manufactures in the Society's house, London. Of agricultural E., the most noteworthy are the great annual shows of the Royal Agricultural Society of England and the Highland and Agricultural Society of Scotland. See AGRICULTURAL SOCIETIES.

The era of great international E. began with the opening of Sir Joseph Paxton's palace of glass in Hyde Park, London, by her Majesty Queen Victoria in May, 1851. The conception of the gigantic idea, and much of the credit of its realisation, were due to the Prince Consort, who at a meeting of the Society of Arts in June, 1849, propounded the scheme. The story of the many difficulties regarding plans for a suitable building, and the ultimate acceptance of Paxton's plans, founded on his experience of conservatory building as a practical gardener, has often been told. The building of glass and iron, at a cost of £193,168, enclosed 20 acres, and was 1851 feet in length. It accommodated the works of 13,937 exhibitors, of whom 6861 were British, 520 colonial, and 6556 foreign. The exhibition remained open five months and a half, during which time it was visited by 6,039,195 visitors, the admission fees amounting to £423,792. After all expenses were paid, a surplus of about £180,000 remained, which her Majesty's Commissioners invested in the purchase of an estate at South Kensington, on which subsequently the South Kensington Museum, the Royal Horticultural Society's Garden, the International Exhibition of 1862, the Albert Hall, and other institutions, were placed. The Great Exhibition of 1851 was hailed by the public with extraordinary enthusiasm, and the most extravagant expectations of millennial peace, combined with increased trade, were widely entertained. That the comparisons which it permitted quickened industrial energy, and more particularly made British manufacturers realise their backwardness in taste and artistic design, cannot be doubted, but the other dreams to which it gave occasion were quickly dissipated. The success, pecuniary and otherwise, of the exhibition, however, gave birth to a numerous train of successors, among which we shall only enumerate those which were on even a greater scale and more cosmopolitan in character.

The *Exposition Universelle* of Paris in 1855 was held in the *Palais de l'Industrie*, a specially erected permanent building, which, with its temporary annexes, cost half a million sterling. It accommodated 20,839 exhibitors, and while open, from 15th May to 30th November, was visited by 5,162,230 persons; the total receipts being £128,000, against an expenditure of about one million. In this and subsequent E. international collections of pictures formed a peculiar feature. The next great exhibition, in order of time, was the London International Exhibition of 1862. The building was of brick, the main hall being a parallelogram 1150 feet long by 560 wide, which with annexes cost £460,000. Remaining open from the 1st May till the 15th November, it was visited by 6,211,103 persons, and the total receipts were £408,530. A second *Exposition Universelle* was opened on the Champs de Mars in May, 1867, the building for which was oviform, and the different sections were arranged in concentric bands. By the arrangement adopted, the entire collections of any nation could be examined by proceeding from the outer band to the centre, and special classes of articles from all nations could be visited by making the circuit of the building in any continuous ring. Beyond the exhibition building, part of the park was enclosed for illustrations of national habitations; and the life, clothing, food, and domestic habits of various peoples were practically illustrated by living families brought from all corners of the globe to inhabit the houses of their countries. The *Exposition* was visited by 6,805,969 persons, and the receipts from all sources were £420,735. The *Weltausstellung* of Vienna, 1873, a building with a central rotunda 312 feet in diameter, covered by a dome, supported on iron girders, larger than that of St. Peter's at Rome, was constructed by J. Scott Russell, and was visited by 6,740,500 persons during the six months it remained open, and the total receipts amounted to £206,477. The Centennial Exhibition of the United States was held in 1876, in Fairmount Park, Philadelphia, and was then the 'biggest thing' which had ever been drawn together. It comprised a main building 1880 feet long by 464 wide, covering 21½ acres, a permanent art gallery, a machinery hall, an agricultural hall, and a horticultural hall, the whole extending over 40 acres. An exhibition on a still more gigantic scale was held in Paris, in 1878, and presented many very striking features; while in London, since the International Fisheries Exhibition of 1883, every year has witnessed an exhibition relating to some particular art or industry; and her example has been followed by leading provincial towns. In 1889 the Paris Exhibition was a notable success, and a 'World's Fair' was held in Chicago in 1892.

While they are regarded as a good advertising medium by exhibitors, faith in their mission to promote universal brotherhood is gone, and it is seriously doubted whether they do much towards a real extension of commercial relationship, or aid in the improvement of manufacturing processes.

Ex′itus may denote the issues or profits of anything, or the children or offspring of animals. *E. terræ* are the rents and fruits of the land.

Ex′moor For′est, a high wild tract of moorland, broken by deep romantic glens, in the W. of Somersetshire, and N. and N.E. of Devon. Its highest point is Dunkerry Beacon, Somersetshire (1668 feet). It is traversed by the rivers Exe and Barle. E. F. was formerly of greater extent, but is being brought under cultivation, and has iron mines. Red deer are to be seen, and E. is famous for its hardy ponies.

Ex′mouth, a flourishing and healthy watering-place in S. Devon, on the English Channel, and on a rising ground at the mouth of the Exe, 10 miles S.E. of Exeter, with which it is connected by rail. It has a mild climate, being sheltered from E. winds by a range of hills. Its chief industries are lace-making and the fisheries. A sea-wall, 18 feet high, affords an excellent promenade. The docks are suitable to the requirements of the place, and the beautiful sands are ever a great attraction to children. Till the rise of Torquay it was the most noted watering-place in Devonshire. Pop. reg. sub-dist. 10,394; urb. san. dist. 8097.

Exmouth, Edward Pellew, Viscount, an English naval commander, was born at Dover, 19th April, 1757. He entered the navy at thirteen, and had a career of uninterrupted success and honour. In 1793, when captain of the *Nymph*, he captured, after a fierce fight, a French frigate, *La Cleopatre*. For this he was knighted. During the wars with France he performed many brilliant exploits off the French coast. In 1804 he was appointed to the command of the English fleet in the E. Indies, and after 1808 held a similar post in the Mediterranean. In 1814 he was raised to the peerage, and two years later, at the head of an English and Dutch fleet, he bombarded Algiers, destroyed its fleet, and compelled the Dey to accept the terms imposed upon him, which included the total abolition of the slave trade. This was the crowning achievement of his career. He was made Viscount Exmouth, and publicly thanked for his services by both Houses of Parliament. E. died 23rd January, 1833. See Osler's *Life of Viscount E.*

Exoce'tus. See FLYING-FISH.

Ex'odus, the second book of the Pentateuch and of the Bible, and so called from its narrating the departure (Gr. *exodos*) of the Hebrews from Egypt, consists of two parts, an historical and a legislative. It is a continuation of Genesis, and the first part relates how the descendants of Jacob were reduced to slavery by a successor of the Pharaoh the patron of Joseph, and grievously oppressed (i.), till at last Jehovah, their God, took pity upon them, and appointed his servant Moses, who had been providentially preserved in his infancy, and was at the time in the land of Midian, to deliver them (ii.-iv.); how Pharaoh, by means of miraculous plagues sent on the land by Jehovah, was compelled to let the Hebrews go, in commemoration of which deliverance the Passover was instituted (v.-xiii.); and how, pursuing after them, he and his host were drowned in the Red sea, while the Hebrews, for whom a path through the sea had been miraculously opened, passed southwards along the shore till they arrived at the desert of Sinai (xiv.-xviii.). The second part of the book relates how Moses received from Jehovah on Mount Sinai the Decalogue (xix.-xx.), laws for the regulation of the social life of the people (xxi.-xxiii.), and instructions for the making and all the appointments of the Tabernacle, and for the keeping of the Sabbath (xxiv.-xxxi.); and how the Tabernacle was made and inaugurated in the first month of the second year after the departure from Egypt (xxxii.-xl.). This article will deal principally with the E. as an historical fact. The question of the *authorship* of the book is involved in that of the authorship of the Pentateuch; other details will be found under MOSES, PLAGUES OF EGYPT, PASSOVER, SABBATH, &c.

The Exodus.—1. *Time.*—The important questions connected with the chronology of the E. are—(1) how long did the oppression of the Hebrews by the Egyptians last, and (2) when did it cease. The light on the subject comes from two sources, the Hebrews themselves and the Egyptians. The narrative in E. implies that the oppression did not last long, for, beginning as soon as the generation of Joseph had passed away, and a king who knew him not sat upon the throne (in whose reign Moses was born), it ended with the E. in the reign of his successor (ii. 23). This is confirmed by the genealogy of Moses, given in vi. 16-20. He was at the same time the grandson and the great-grandson of Levi, the son of Jacob, which corresponds with the statement in Genesis xv. 16, that they would return to Canaan in the fourth generation after the settlement in Egypt. On the other hand it is stated elsewhere (Gen. xv. 13, and Exod. xii. 40) that the slavery lasted 400 years, and the whole sojourn in Egypt 430 years. But the Apostle Paul (Gal. iii. 17) dates the beginning of the 430 years, not from the time of the going down into Egypt, but from the giving of the promise to Abram (Gen. xv.), which, counting 25 years from Abram's leaving Haran to the birth of Isaac (Gen. xii. 4, xxi. 5), 60 to the birth of Jacob (Gen. xv. 26), and 130 to the going down into Egypt —in all 215 years—leaves 215 for the sojourn in Egypt. This is in fact the only way that the time can be made nearly to correspond with the genealogy of Moses (Exod. vi. 16-20), because, if the sojourn in Egypt lasted 430 years, Moses, who was 80 years old at the E. (Acts vii. 23, 30), must have been born when his mother was 256 years old, even if we suppose her to have been begotten in the last year of her father's life; for her father, Levi, who lived 137 years (Exod. vi. 16), was 43 years old when he went down to Egypt with his father [being four years older than Joseph, because born in the third year after Jacob's marriage with Leah (Gen. xxix. 34), and Joseph in the seventh (Gen. xxx. 25, *cf.* xxxi. 41), and Joseph was 39 years old at the time (*cf.* Gen. xli. 46, and add nine years)], which gives 430 – (137 – 43 + 80). There would, moreover, be no necessity for putting St. Paul, who followed the LXX., in the wrong, were it not for the numbers of the nation who are said to have gone out of Egypt—600,000 fighting men, which implies a population of at least 2,500,000. This increase from the 70 persons who went down to Egypt (Gen. xlvi. 27) in 215 years appears to some so improbable as to make them adopt the 430, or even a longer period, while to others the 215 seems quite sufficient, with allowances for polygamy and foreign marriages. According to the traditional Biblical chronology, then, the date of the E. would be about 1650 B.C. or 1865 B.C.

The Egyptian accounts are derived from inscriptions on monuments, and from the history of Manetho (q.v.). Manetho (*apud* Josephus) tells the following story:—King Amenophis desired the privilege, which had been granted to Horus, of seeing the gods. One of the priests told him there would be no difficulty about it if he would rid Egypt of all who were unclean or leprous. Whereupon the king assembled all the lepers, to the number of 80,000, and sent them to work in the quarries E. of the Nile. The priest, in terror for the consequences of what he had done, took his own life, but first sent to the king a prediction that these outcasts, with foreign help, would be masters of Egypt for thirteen years, the revenge of the gods for the indignity offered to their servants, the priests among the lepers. Thereupon the king relieved them all from their bondage, and permitted them to remove to the town of Avaris, where Osarsiph, a priest of Heliopolis, who afterwards took the name of Moses, put himself at their head, gave them laws which violated all the customs of the Egyptians, and sending for the remnant of the Hyksos, who had been expelled, with their help conquered Egypt. After a rule of 13 years they were driven out by the king's son, Sethos or Ramses, and pursued to the borders of Syria. The question here is to identify the King Amenophis and his son Sethos-Ramses with the historical rulers mentioned on the monuments. It is in the reign of Rameses II. (Miamun of the monuments, Gr. Sesostris), of the nineteenth dynasty, who ascended the throne about 1400, that there occur events recorded on the monuments which correspond with those recorded in E. This Pher-ao, who reigned sixty-six years, erected as a bulwark against the Asiatics a great wall on the E. side of Egypt, from Pelusium to Heliopolis, with a chain of forts, the two chief of which were Pa-khatem (Pithom) and Paramessu (or 'city of Rameses,' *cf.* Exod. i. ii.). In an official report of the king's reign, preserved on a papyrus which is in the museum of Leyden, a scribe reports to his superior that he has distributed the rations 'among the *Hebrews* (Apuru) who carry the stones to the great city of Rameses-Miamun.' Several other distinct references are made to the Hebrews in other papyri, and in the rock inscriptions of Hamamat. Rameses was succeeded about 1334 B.C. by his son Menephtah (the Amenophis of Manetho), who continued the construction of Paramessu, and the brickmakers were condemned to send in a certain number every day (*cf.* Exod. v. 8). It is generally supposed by Egyptologists that this is the Pher-ao in whose reign the E. took place, on which supposition, as he reigned about twenty years, the date would be about 1334-14.

2. *Route.*—The traditional route followed by the Hebrews in their march from Egypt is in a sense well known. Setting out from Rameses, supposed to have been about 40 miles N.W. of Suez, they went S. and E. a three days' journey, halting at Succoth and Etham, and encamped on the Red

Sea, near the head of the Gulf of Suez, the only controversy being as to the place—a few miles up or down—at which the passage took place. Those who wish to avoid the miraculous, and to account for the crossing by natural causes, *e.g.*, an ebb-tide, &c., place it at the very head of the Gulf. Another theory has, however, been put forth by Professor Brugsch-Bey, which he asserts corresponds far better with the geography of the time, namely, that the route taken was E. and then N. between Lake Serbonis and the Mediterranean Sea. He asserts that Rameses, from which they started, was Paramessu, afterwards called Zoan, and still later Tanis by the Greeks, and that Succoth was Pithom. He conjectures Etham to be the Egyptian *Khetam*, which is on the borders of the desert (*cf.* Exod. xiii. 20), to the W. of the modern El-Khantereh. From there, he thinks, they directed their course northwards, to Migdol (Gr. *Magdolon*, the modern Tel-es-Semout). Then they encamped between Migdol and the Mediterranean, in face of Pihahiroth and before Baal-zephon (Egypt. *Baali-Tsapuna*), a sanctuary close to Mount Kasios; and it was in the isthmus there, between Lake Serbonis (the 'Serbonian Bog') and the Mediterranean, that the Egyptian army, when in pursuit of the Hebrews, perished amidst 'a sea of seaweeds' or 'reeds,' which has often proved fatal to numerous hosts and single travellers, notably a large part of the Persian army of Ochus about 350 B.C. Arrived at Mount Kasios, the E. frontier of Egypt, they went S. to Marah, or the Bitter Lakes, and from there to Elim (Egypt. *Aalim*, 'fish-town') to the N. of the Red Sea. It may be mentioned that for 'Red Sea' in the authorised version of E. the Hebrew has simply the 'sea'—xiv. 2, 9, &c.; in other passages it is 'sea of weeds' or 'reeds'—x. 19. See Colenso's *Pentateuch and Book of Joshua* and Birch's *Egypt from the Monuments*.

Ex Offi'cio is a term legally applied to acts done by a functionary in virtue of his office, and not at the suit or on the employment of any other party. In the law of England, an E. O. information is an Information (q.v.) filed by the Attorney-General without the intervention of any judicial authority, in the Queen's Bench Divisional Court at the instance of the Crown, and the case is tried by a county jury in the county where the proceedings have taken place.

Ex'ogens, Exog'enous Plants, terms used in botany in opposition to the name *Endogenous* and *Endogens* (q.v.). E. P. are 'outward growers,' that is, increase by the growth of new matter on the external or outer surface of the already-formed material. All our familiar trees and plants are E., and the name may therefore be regarded as synonymous with Dicotyledons (q.v.). In its young state, an E. stem is entirely composed of cells, but soon, by the growth of bundles of vessels, the stem of the young exogen divides into two parts—an inner or central part, the pith or medulla; and an outer or cutical part, the bark, which is covered by the Epidermis (q.v.). The pith and bark are connected by lines of cellular tissue, named *medullary rays*, which radiate through the wood. The pith is separated from the wood by the medullary sheath. The old wood next the pith is usually hard and dry, and is hence named *duramen* or *heart-wood*, the outer and softer wood being termed *alburnum* or *sap-wood*. Between the wood and bark we find the *cambium* layer of cells, which forms the new wood, arranging it in concentric circles or zones, each representing one year's growth. The bark, cellular at first, consists of the liber or inner bark, and of the corky layer which forms the outer bark. The bark increases by additions to its inner surface, but as its rate of growth is in many cases slower than that of the true wood, it cracks and exhibits the familiar gnarled appearance. The branches of E. are lateral, that is, are given off from the sides of the axis of the stem.

Exogo'nium (or **Ipomæ'a**) **Purg'a,** the species of *Convolvulaceæ* which affords the Jalap (q.v.) of medicine. It is a native of Mexico, but is cultivated with success in many parts of Britain as an open-air plant. Other species are *I. Orizabensis*, from which an inferior quality of Jalap is obtained, named 'fusiform' or 'light jalap.'

Exonera'tion (Lat. *ex*, 'out of,' and *onus*, 'a burden'), in law, signifies the legal act which frees one from an obligation.

Exophthal'mia (Gr. *ex*, 'out,' and *ophthalmos*, 'the eye'), protrusion of the eyeball, may be caused by disease of the eye, or by any kind of growth within the orbit. If the case is left to itself, the protruded eye sometimes inflames and bursts.

Ex'orcism (Eccl. Gr. from *exorkizō*, 'I administer an oath'), or the driving out of Demons (q.v.) from those possessed by them, has been practised by Jews, Christians, and Pagans. The power of E. was regarded as a peculiar gift or art, the means used in it being certain incantations or charms, drugs, and ligatures. The first trace of the art among the Jews occurs in the case of Saul, whose demon was exorcised by David's music. Various words, especially names, were used for this purpose. Origen (*Cont. Cels.*) says that the name of Abraham was irresistible, even when used by those who knew not who Abraham was. So was that of Solomon, who, Josephus tells us, was particularly instructed in the art of E. by God, and left rules and charms for it, which Josephus himself saw effectually used by one Eleazar (*Ant. Jud.* viii. 2, 5; *cf.* Matt. xii. 27, and Acts xix. 13.) Several acts of E. performed by Jesus Christ are recorded in the Gospels. The power was part of the equipment of the apostles (Matt. x. 1, 8; Luke x. 17-19); hence St. Paul, as a true apostle, possessed it also (Acts xvi. 16-18). According to ecclesiastical historians, the same power was continued in the Church. At first it was not confined to particular persons; any Christian could do it by the irresistible charm of the name of Jesus and the sign of the cross. Then, as the whole world was held to be divided between the kingdom of God or the Church, in which demons could only persecute and afflict, and the kingdom of Satan, that is, the pagan world, in which they possessed supreme power, it was specially required that all candidates for baptism should be properly exorcised. For this purpose, in the 3rd c., an inferior order of clergy, called exorcists, was instituted, who were ordained to the office. There seems to have been great numbers of demoniacs in those early ages, who were kept in a certain part of the churches, as in an hospital, and it was the duty of the exorcists 'to pray over them on some occasions, and to provide their daily food, and keep them employed in some bodily exercise and innocent business, of sweeping the church and the like, to prevent the more violent agitations of Satan.' After the E. of all candidates for baptism was thus reduced to the ordinary duty of an order of the clergy, the power of extraordinary E. of demoniacs seems to have ceased, and it is admitted by all classes of writers that E. died out altogether about the time when Christianity was made the established religion by Constantine (324). This was only for a time, however, for there were instances of it after, as well attested as any in the earlier ages. Christian apologists hold very various opinions as to the time when this miraculous power ceased in the church. The Church historians down to the Reformation all relate the exercise of it down to their own time. By many eminent Roman Catholic writers the same power is brought down to the present day. Among Protestants, the most prevailing opinion perhaps is that it ceased after the time of the apostles, although a century ago it was just as well received that it continued through the first three centuries till the time of Constantine. Others, again, drew the line at the end of the 4th c., others at the end of the 5th, while others put it back to the 2nd. Besides persons, certain things were exorcised, *e.g.*, water, salt, and oil, to be used for sacred purposes.

Ex'osmose (Gr. 'outward motion') and **En'dosmose** ('inward motion'), terms applied by Dutrochet to denote the transfusion resulting from the separation of two liquids or gases by an animal or vegetable membrane. See CELLULAR TISSUE.

Exostemm'a, a genus of plants belonging to the *Cinchonaceæ* (q.v.). The species of E. afford varieties of cinchona, known as 'false cinchona,' which may be distinguished from the true cinchonas by having *exserted* stamens, that is, stamens extending beyond the corolla. *E. floribunda* of the W. Indies is a familiar example.

Exosto′sis (Gr. *ex*, 'out of,' and *osteon*, 'a bone'), an unnatural protuberance or morbid enlargement of a bone. E. is predisposed to by scrofula, cancer, &c., and is sometimes hereditary; but, in general, it occurs without any distinct or appreciable exciting cause. *Hard E.* differs in appearance and composition from true bone. *Soft E.* grows rapidly, often attains a considerable size, and is very commonly multiple. In structure and chemical composition soft E. is identical with cancellated bone. It is often necessary to remove such tumours by operation on account of the pain they give rise to from pressure.

Exoter′ic. See ESOTERIC.

Exot′ic Plants, the name generally applied to plants derived from a foreign country. E. P. may grow openly and without care, or may require delicate attention and shelter.

Ex Par′te. In judicial proceedings a step is said to be taken *ex parte* when the opponent is not present. See DEFAULT, ABSENCE.

Expectation ('a waiting or looking out'), the observance of disease without application of active remedies, but with the use of physiological means to counteract any evil consequences, as in the case of a fractured bone, when splints are fitted, and adjusted from time to time if necessary, yet the union of the two pieces is left to nature.

Expectation Week, was the name given to the interval between Ascension Day and Whit-Sunday, during which the apostles are said to have continued in prayer and E. of the Holy Spirit.

Expec′torants (Lat. *ex*, 'out of,' and *pectus*, 'the breast'), medicines which promote the secretion of bronchial mucus, modify the character of the secretions, and promote their discharge. E. are all stimulants, and most of them contain a resinous element. Their use is contra-indicated during the acute or inflammatory stage of bronchitis. The principal E. are—acid, benzoicum, ammonia, A. carbon, ammoniacum, ammonii chloridum, antim. tart., bals. Peruv., bals. Tolut., copaiba, cubeba, galbanum, ipecacuanha, myrrha, scilla, and senega.

Expen′ses. The Costs (q.v.) of a lawsuit are called E. in Scotland. The general rule of law is that the party found in the right is entitled to a decree for his E.; but as it often happens that right is found to be partly on both sides, or that the party mainly in the right has somewhat erred in legal procedure, the adjustment of E. often involves nice calculation and considerable legal difficulty. The practice is for the judge, after deciding points of law affecting E., to remit accounts to the Auditor (q.v.) of the Court of Session to adjust accordingly, and subject to a revision by the Court, the latter being seldom resorted to. Clients may require taxation of their agents' accounts. The amount of fees paid to counsel is never interfered with if *bonâ fide* and reasonable; but a certificate from the counsel or his clerk must if required be produced, that the fees paid were of the amounts and dates stated in the accounts.

Expe′rience is now recognised as the only ultimate source of our knowledge of nature and nature's so-called laws. It is the accumulated result of human observation and experiment, is consequently exceedingly limited, and forms the backbone of all inductive science. For man, whose E. therefore rests upon the knowledge acquired by experiment, and observation through some six thousand years only, to term any one of his experiences as a *law* of nature is as presumptuous as it may be erroneous. Experiment differs from observation solely in the fact that the phenomena observed are controlled and directed to a greater or less extent by human agency, and it is usually undertaken with a view to the testing of preconceived truths, or to the further elucidation of some phenomenon, though frequently the result obtained is not that which was expected. Many of the most important physical *laws*, indeed, have been discovered from experiments which the investigator made to test some relation which his fancy conceived to exist. On account of the varied combinations which the experimenter has at his disposal, it would naturally be expected that a science in which experiment is possible would be developed much more rapidly and with greater unity than one in which E. rests upon observation merely. Such, indeed, is the case; for of all sciences, meteorology seems the most disjointed and unsatisfactory. Astronomy, it is true, is the most complete of all, and in it experiment in the true sense of the word is not possible; but here such uniformity reigns, that observation aided by theory has acquired a degree of certainty which is scarcely equalled in any branch of experimental science. When once a great general principle in nature is laid bare, progress and development follow immediately. This principle, however, can be discovered only by experiment, or by appeal to experiment. In astronomy, Newton's discovery of the *law* of gravitation was the signal of progress; and what Newton did for astronomy, Œrsted, Ampère, and Faraday have done for electricity, Young and Fresnel for light, and Rumford, Davy, and Joule for thermo-dynamics. The principle of the conservation of energy is itself a scientific induction from experiment, and to it are due the great strides which scientific knowledge has taken during the last half of a century.

Ex′pert (Lat. *expertus*, 'one thoroughly proved by experience'), a term applied to one who has special practical knowledge on any subject, and particularly to an adept in handwriting for detecting forgery, or to a witness in a law-court who has peculiar scientific knowledge, as in the exposure of a case of poisoning.

Explo′sives, the name given to substances which, under the influence of heat, electricity, or percussion, are suddenly converted from a solid or liquid state into a gaseous form, producing an explosion whose force is proportional to the volume of the gas and its rapidity of disengagement. These substances are either chemical compounds or intimate mechanical mixtures. In the former the explosion results from the violent dissociation of the combined elements, as, for example, when the liquid chloride of nitrogen is resolved into its two component gases, chlorine and nitrogen; and in the latter the explosion arises from the combination or rearrangement of the elements composing the mixture, of which gunpowder is the type.

Gunpowder and analogous preparations have long been used for purposes of war and pyrotechnic display, but the bulk of the substances embraced under the term E. have only of late years been discovered, and already their manufacture and utilisation in mining and blasting operations have made wonderful progress. In their respective places in this work, the composition and character of the most important E. are dealt with; here we only can enumerate those kinds which have been commercially prepared, or practically used, and for convenience of arrangement we shall classify them as mixtures and compounds. In mechanical mixtures a nitrate or a chlorate is the predominant ingredient, and with heat it freely gives off oxygen, which in a nascent condition combines with the other ingredients, generally carbon and sulphur, forming gaseous products. The nitrate mixtures embrace gunpowder, pyrolithe (nitrate with carbonate of soda, sulphur, and sawdust), and poudre-saxifragine (nitrate of baryta, saltpetre, sulphur, and charcoal). The chlorate mixtures comprehend Horsley's blasting-powder (chlorate of potash, charcoal, powdered nut-galls, &c., soaked with nitro-glycerine), Brain's blasting-powder (resembling that of Horsley), Ehrhardt's powder (chlorate and nitrate of potash, powdered coal and tannin), teutonite, chlorated gun-cotton, &c. The chief chemical compounds constituting E. are—nitro-glycerine, and bodies prepared from it—dynamite, dualine, lithofracteur; glyoxiline (gun-cotton pulp and saltpetre saturated with nitro-glycerine and methylic nitrate), gun-cotton, cordite, cotton-gunpowder, Schultze's powder (woody fibres treated with nitric and sulphuric acid and hot alkalies, and afterwards saturated with nitrate of potash solution), nitro-mannite picric powder, the chloride and the iodide of nitrogen, and the fulminates of mercury, silver, &c.

In Great Britain, on the 1st January, 1876, the Explosive Substances Act, 1875 (38 Vict. c. 17), came into operation. It provides for the greater safety of the public, in so far as it secures the proper conduct of the manufacture, storage, transport, importation, and shipment of E., heavy penalties being exacted for non-observance of the regulations.

Storage of Explosives.—Mr. W. H. Chambers of the Control Department, Woolwich, some time since invented a magazine which reduces the danger attending storage of E. to a minimum. It takes the form of a cylinder or drum, the sides and bottom of which are formed of materials of low conducting power, as plaster of Paris, Portland cement, and ground cork, with outer, inner, and intermediate casings of galvanised sheet iron. The top is similarly constructed and is screwed down, and the outer casing is pierced with several small holes plugged with red lead. The holes, on the removal of the red lead, allow of the escape of moisture or steam that may be generated by the exposure of the magazine to great heat. A fire sufficiently strong to raise the outer casing to welding-heat in no way affects the gunpowder stored within. The magazines are as thoroughly damp-proof as fire-proof.

Explosive Material, Law Regarding.—By 24 & 25 Vict. c. 100, whoever shall maliciously, by gunpowder or other explosive substance, destroy or injure any dwelling-house, anyone being in it, is guilty of felony subjecting to penal servitude for life. To place or permit any spring-gun, man-trap, or other engine dangerous to life in his ground, renders the owner liable to penal servitude for life, or for any term not less than three years or to imprisonment for any term not more than two years, though he may make such arrangement within his dwelling-house for defence between sunset and sunrise (24 & 25 Vict. c. 100). See GUNPOWDER, LAW REGARDING.

Expo'nent, in algebra, is a number or symbol representing a number placed above and to the right of an expression, thus indicating the power to which that expression is to be raised. (See EVOLUTION AND INVOLUTION.) From this definition we have at once the *law of exponents*, $a^m \times a^n = a^{m+n}$; from which, by putting $n = -m$, we deduce that a^{-m} is the reciprocal of a^m, and by putting it equal to nothing, $a^0 = 1$. In these, m and n may be either integral or fractional. An *exponential* equation is one into which the unknown quantity enters as an E., such as $a^x = b$. The *exponential theorem* is the expansion of a^x in ascending powers of x. The whole subject is intimately connected with Logarithms (q.v.).

Expo'sing Chil'dren, under two years of age. If with intent to kill and the child die, this is murder; if the exposure be such that the child's life is endangered or the health of the child be, or be likely to be, permanently injured, this is a misdemeanour punishable with penal servitude for three years or imprisonment for two.

Ex Post Fac'to is a legal term denoting an act done to affect a right previously questioned or a demand previously made. An *ex post facto* law operates retrospectively. It is only in extraordinary circumstances that this effect is given to a penal measure.

Expressio'né, Con, or **Expressi'vo** (Ital. 'with expression'), a term used in music as a direction to the performer.

Exten'sion (Lat. *extensio*, 'a stretching out'). In logic most terms have a meaning in E. and a meaning in intension, the former comprising the individual things to which the term applies, the latter comprising the qualities which those things must possess. Thus *planet* in E. denotes the earth, Mars, Venus, &c.; in intension it means a heavenly body with the *quality* of revolving round the sun, &c. Different but related terms vary in the quantity of their E. and intension. Thus *animal* has a greater E. of meaning than *man*, as including all quadrupeds and other organically breathing creatures; while it has a less intension, for among the qualities of *man* must be the qualities of *animal* as well as others peculiar to *man*. If we add the adjective *white* to *man*, we narrow the meaning in E., but we deepen the meaning in intension, *white man* being applicable to fewer individuals than the term *man*, but implying a new quality in addition to the qualities implied by *man*. It is an invariable law that as the intension of a term is increased the E. is lessened, but not in any exact ratio. Hamilton uses *breadth* and *depth* for E. and intension, while Mill uses *denotation* and *connotation*.

Extent, in English law, is a writ issued to recover debts of record due to the Crown or at the suit of a Crown debtor against his own debtor. In the former case it is called an *E. in chief*; in the latter, an *E. in aid*. It is of the nature of a writ of execution, and binds all the defendant's lands and property; the person may also be taken unless otherwise directed. Appeals in cases of an E. lie in the Queen's Bench Divisional Court and also in Parliament.

Extent, Crown's, in Scotland. By the treaty of union between England and Scotland the revenue laws of the two countries were assimilated, and the Crown's preference and the English form of execution by extent were introduced in revenue matters, with limitation of operation to moveable property. By the Court of Exchequer Act the forms of procedure against Crown debtors have been remodelled and made similar to the procedure in other cases.

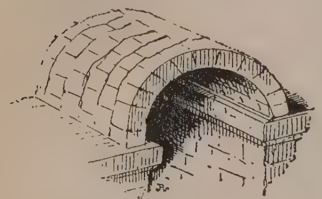
Extor'tion (from Lat. *ex*, and *torqueo*, 'I wrest'), in a wide legal sense, signifies any oppression under pretence of right. In a limited sense it denotes the offence of any one taking money or other valuable officially where none is due, or taking more than what is due, or of requiring a payment before the proper time. The punishment is removal from office, fine or imprisonment. By 24 & 25 Vict. c. 96, if any one, knowing the contents thereof, send, deliver, or utter, or directly or indirectly cause to be received any letter or writing demanding money or other valuable, and threatening to accuse any one of any crime punishable with death or penal servitude, he is liable to penal servitude for life. And any one accusing or threatening to accuse another of the crimes referred to is declared guilty of felony and subject to penal servitude.

Extract (Lat. *extractum*, 'what is drawn or taken out'), in Scotch law, signifies either the proper written evidence or warrant on which *diligence* or *execution* on a judicial decree may issue, or an authenticated copy of deed or other writing the principal of which, or a transcript of the principal, has been preserved in a public office. The official by whom the E. is prepared and authenticated, and who is usually the clerk of Court, is called an Extractor.

Extract of Meat is obtained by separating from animal food all the nutritious constituents and condensing them into small bulk. For commercial purposes the extract is placed in hermetically-closed vessels, that it may remain, for an indefinite length of time, without any putrefactive change occurring. It is useful in many circumstances, for with it beef-tea or soup can be prepared in a short time. Although the extract may contain all the nutritious constituents of animal food, it can never serve as an exclusive article of diet, for quantity is as necessary as quality for the sustenance of animal life.

Extracts are substances resulting from the evaporation of vegetable juices, or the solutions of their active principles. The solutions are obtained by means of such menstrua as water, acetic acid, alcohol, ether, and glycerine, cold or in various degrees of heat. The process of evaporation is best conducted *in vacuo*. E. vary in consistence from a soft paste to a hard, brittle solid, and they may be administered in pill, solution, or mixture. The group of E. comprehends all medicinal substances from the vegetable kingdom.

Extradi'tion (Lat. *extra*, and *ditio*, 'a giving over') is the giving up of a person accused of a crime committed in a foreign country to the foreign jurisdiction. Conventions were concluded by England with France and the United States in 1843 (by statute 6 & 7 Vict. cc. 75, 76, repealed by Act of 1870) for the E. on both sides of persons accused of specified offences. Treaties have been entered into with France, Germany, United States of America, Denmark, Italy, Belgium, Brazil, Austria, Sweden, and Spain, for such purposes of E. The E. Act of 1870 confers on the Queen a general power of making arrangements with any foreign state with respect to the surrender of any fugitive criminal charged with certain crimes, and provides that existing E. conventions should be carried out under the Act, special restrictions being imposed in reference to persons only charged with political offences. By the E. Amendment Act of 1873 accessories are liable to be surrendered.



Extrados.

Extrados, in architecture, means the upper convex surface of an arch or vault, also the curve formed by the upper side of the voussoirs or rows of niches for statuettes.

Extrajudi′cial. The term is usually applied in law in contradistinction to *judicial.* E. matter is that which is not intended to form any part of the record, or of the judicial pleadings, or admissions of the parties, such as communings or correspondence with a view to a private settlement of the case. E. concessions to avoid a lawsuit cannot be founded on where negotiation has failed.

Extravasa′tion (from Lat. *extra*, 'beyond,' and *vado*, 'I go quickly') is the escape of any of the fluids of the living body from their vessels owing to disease or injury of their coats. The term is most commonly applied to E. of blood, or blood effusions, where the contents of the vessels, arteries, capillaries, or veins, escape entire into the cellular tissue beneath the skin. In the broader sense of the term there may be E. of blood into any organ or part of the body, or E. of any fluid contained in vessels into any part of the body through which they pass.

Extre′me Unc′tion (Lat. *extrema unctio*, 'the final anointing') is one of the seven sacraments of the Roman Catholic Church, and is defined to be a sacrament 'wherein by the anointing with oil and prayer in the prescribed form, by the ministration of a priest, grace is conferred on the baptized dangerously ill, whereby sins are remitted and the strength of the soul is increased.' The ceremony of E. U. is first met with among the Marcosians, a Gnostic sect in the 2nd c., who anointed the dead with an oil or balsam, and pronounced a prayer over them, 'to the end that the souls of the departed, freed from the Demiurgus and all his powers, might be able to rise to their mother, the sophia.' Within the Church it originated in the act of anointing by a bishop or priest, which was immediately connected with the sacrament of the Lord's Supper, when administered to dying persons. An anointing of the sick is mentioned by Innocent I. in the beginning of the 5th c., and by Felix IV. in the beginning of the 6th. It came into general use from the 9th c., although it was not universally adopted in the West till the 12th. It is alluded to by St. Augustine, St. Gregory, Fortunatus of Poitiers, and Gregory of Tours; and in the Greek Church by Origen, Chrysostom, Victor of Antioch, and Cyril of Jerusalem, but the first who spoke of it as a sacrament was Hugo of St. Victor.

The Church of Rome founds her doctrine on the subject (Council of Trent, can. 2, 4; sess. xiv.) on Mark vi. 13, and James v. 14, 15, although both of these passages seem to have more reference to the recovery of the sick than to their death.

Extrin′sic Ev′idence is evidence beyond (Lat. *extra*) that of the deed or document under consideration. The general rule of law is that it is incompetent to contradict or modify the terms of formal writings unless fraud be alleged and proof offered; but in certain circumstances, as where there is ambiguity in the writing, such evidence is admitted in explanation. See Evidence.

Exuda′tion (Lat. *ex*, 'out,' and *sudatio*, 'a sweating') is the escape of a portion or constituent of the fluids of the living body from their vessels, and is not necessarily the result of disease or injury. E. never results from the rupture of a vessel, and in this respect it is distinguished from extravasation. When E. occurs, the vessels may be entire, or their coats may be in a relaxed condition, or a vein may be weakened from disease or injury; and the effusion takes place by mechanical filtration.

Exu′mas, The, a cluster of W. India islands forming part of the Bahamas (q.v.). They are known as the 'Great Exuma,' 'Little Exuma,' and 'Exuma Keys.' Great Exuma is 30 miles long and 3 broad. Agriculture and salt-making are the chief pursuits. Salt is exported amounting to 116,000 bushels in a year. Exuma town is next in importance to Nassau as a port of entry in the Bahamas. Pop. about 2000.

Ey′alet, the name used formerly for a division of Turkey, which was ruled by a pacha, but which gave place to the vilayet on the administrative reorganization of the empire in 1871.

Eyck, Hubert and **Jan Van,** two Flemish painters of the latter part of the 14th and the beginning of the 15th c., of whom the chief facts known are that they were the first to make the practice of painting in oils general (see Painting), and that they have exercised an extraordinary influence on the development of the art of modern times. Hubert, born at Maas-Eyck, near Liège, in 1366, was a member of the fraternity of Notre Dame at Ghent, where he died, 18th September, 1426. Of his art no distinctively authentic specimens remain, but from the circumstances that he was the instructor of his brother Jan (who was twenty-four years younger), and that they lived and painted together until the latter was thirty-six years of age, and had risen to fame, it is presumable that the reputation of the younger brother was shared in by the elder during the lifetime of the latter. Jan Van E., the great master of the old Flemish school, born at Maas-Eyck about 1390, resided and practised painting with his brother successively at Bruges and Ghent. He was the first to employ drying oils with suitable varnish in painting, and with such success that to the present day his works compare favourably for freshness of colour and for solidity with those of living painters. The 'Adoration of the Lamb,' on which both the brothers worked, but which was completed by Jan, and is his greatest work, is an altar-piece with folding wings. The centre pieces are at Ghent, the wings in Berlin. In the National Gallery are three pictures by Jan, but his chief works are in the museums of the Continent. He died at Bruges in 1440 or 1441. A colossal statue of Jan was completed at Brussels in April, 1878.

Eye (Old Eng. *eag*-e; *cf.* Ger. *aug*-e, Lat. *oc*-ulus). *Anatomy of the Eye.*—The organ of vision consists (1) of external protective parts or appendages; (2) of an optical apparatus of refractive media by which a distinct inverted image of any external object is formed on the retina or sensitive coat; and (3) of the terminal organ termed the retina, connected with the expansion of the optic nerve, which receives the impressions of rays of light and transmits these along the filaments of the optic nerve to the brain.

The External Protective Parts or Appendages.—These are the *eyelids*, which are movable folds of skin, having between the layers a thin plate of cartilage. Each eyelid is lined by a mucous membrane, which is reflected over the surface of the globe of the E. and constitutes the *conjunctiva.* Between the skin and the conjunctiva there are numerous fibres of connective tissue, muscular fibres, the cartilage above mentioned, and numerous small glands called the *meibomian* glands, which secrete matter for lubricating the surface of the eyeball. The *eyelashes* are hairs attached to the margin of the lids. Intimately connected with the external appendages of the E., there is an arrangement for the secretion of the tears, termed the *lachrymal apparatus*, consisting of the following parts: the gland (*lachrymal gland*) by which the tears are secreted near the upper side of the orbit; two small *canals* near the inner angle, into which the fluid secreted by the gland is received; and the *lachrymal sac* and *nasal duct*, or passage by which the tears are conveyed from the lachrymal canals to the cavity of the nose. The eyebrows, eyelids, and eyelashes shade the E. from excessive light, and prevent the access of dust floating in the air. The watery fluid secreted by the lachrymal gland keeps the anterior surface of the E. moist and translucent. When this fluid is formed in excess, under the influence either of an emotion or of an irritant applied to the surface of the E., it constitutes *tears*.

The eyeball is situated in the cavity of the skull termed the *orbit*, in which it lies embedded amongst a quantity of fat. It is moved about by the action of six muscles—four straight, or *recti*, and two *oblique*. By the action of these muscles it may be rotated upon either an antero-posterior, or a transverse axis.

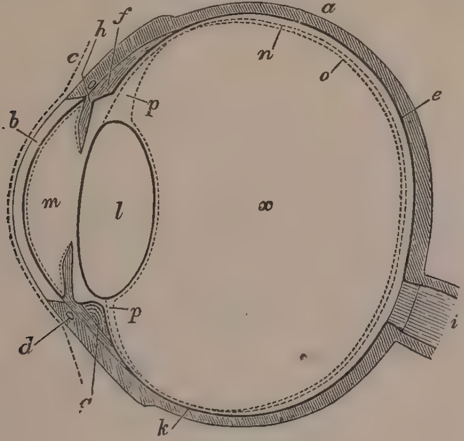


Fig. 1.

The general form and appearance of the eyeball are seen in Fig. 1. When viewed in profile, the E. is composed of segments of two spheres, of which the anterior is the smaller and more prominent. It consists of several investing membranes, enclosing certain fluid and semi-fluid matters. The membranes are three in number, viz.—(1) A tough fibrous covering termed the *sclerotic* (*a*); (2) a middle vascular, pigmentary, and partially muscular layer, divided into an anterior portion called the *choroid* (*k*), and a posterior, the *iris* (*h*); and (3) a nervous stratum, the *retina* (*n o*). The enclosed refracting media are also three in number, viz.—(1) The *aqueous humour* (*m*); (2) the *crystalline lens* (*l*); and (3) the *vitreous humour* (*x*). The anterior part of the eyeball, which is clear and transparent, is called the *cornea* (*b*). The cornea consists of a thick fibrous part, the cornea proper, covered in front by the *conjunctiva* (*c*), and a thin elastic layer known as the *anterior elastic lamina;* and behind by a similar elastic lamina, seen dotted in Fig. 1, usually called the *membrane of Demours*. The proper cornea is of the nature of epidermis rendered transparent. The middle tunic of the eyeball consists, as above mentioned, of two coats, viz., a vascular and pigmentary coat called the *choroid* (*k*), and a small anterior muscular part, the *iris* (*h*). The inner surface of the choroid is lined by a layer of hexagonal cells filled with black pigment, and serves the same purpose of absorbing extraneous rays of light as the blackening seen on the inner surface of a camera. The iris is the contractile and coloured membrane which is seen behind the cornea, and which gives colour to the E. Its centre is perforated by an aperture termed the *pupil*. Fibrous tissue and involuntary muscle form the tissue of the iris, in the meshes of which numerous pigment cells are also found. The iris serves as a contractile diaphragm, by which excess of light is cut off, and sharpness of definition of the retinal image is thus secured. The pupil contracts under the influence of light, so that with brilliant illumination it may be reduced to a very small size. The iris and the crystalline lens, the latter being held in position by a transparent capsule (*p*), divide the E. into two chambers, an *anterior* (*m*), containing the aqueous humour (*m*), and a *posterior* filled with the vitreous humour (*x*). The former consists simply of water holding in solution a small quantity of saline material, while the latter is composed of a jelly-like substance, lying in a meshwork of extremely delicate connective tissue. The *crystalline lens* (*l*) is a doubly convex, solid, transparent body, formed of numerous laminæ placed one outside of the other, and having in the centre a firm and hard *nucleus*. The convexity of the lens is greatest behind. Its various laminæ are formed of thin delicate fibres. The lens is held in its place by a *suspensory ligament*, which surrounds its margin, and it also possesses a transparent *capsule*. The *retina* (*n o*) is a most delicate pulpy substance, placed behind the vitreous humour, and in front of the choroid. It extends forward nearly to the anterior margin of the choroid. Its outer surface, that next to the choroid, is formed by a special layer named after its discoverer *Jacob's membrane*. After the soft retina has been hardened in alcohol or chromic acid, and thin sections are made perpendicular to its surface, an appearance similar to Fig. 2 may be obtained. It will be seen that it consists of a series of dissimilar strata, viz.—(1) A layer of rod and cone like bodies forming Jacob's membrane (*b c c′ b′*); (2) a fine granular layer (*d*); (3) another granular layer having larger granules (*f*); (4) a finely molecular layer, composed of molecules and extremely fine fibres (*g*); (5) a layer of large nerve-cells (*h*), which are connected by filaments (*h′*) with (6) the innermost layer (*i*) (that is, the one next the vitreous humour) formed by the expansion of the optic nerve. In the centre of the retina there is a *yellow spot*, where vision is most acute. In this spot the only part of the retina present is the layer of rods and cones. About one-tenth of an inch inside the yellow spot is a round disk, *porus opticus*, where the optic nerve expands, and where there is complete insensibility to light.

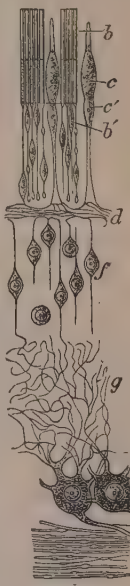

Fig. 2.

Physiology of the Eye.—Within the limits of this article it is impossible to do more than to give a brief outline of the more important points.

General Optical Character.—The E. may be regarded as a camera consisting of four lenses of different structures, densities, and curves, surrounded by a strong fibrous covering, the sclerotic, and lined by a pigmentary layer, the choroid. The four refractive structures through which a ray of light must pass before it reaches the retina are, from before backwards, the cornea, the aqueous humour, the crystalline lens, and the vitreous humour. The action of these four refractive structures is to form a picture of external objects on the retina. The action of rays of light on the retina is to stimulate the terminations of the filaments of the optic nerve, which are in connection with the retinal elements; the influence on the nerves is conveyed by them to the sensorium, and the consequence is consciousness of vision. It has been shown that the layer of rods and cones in the retina is the part really sensitive to the action of light, and that the specific action of light is to effect certain chemical changes in this part, which may be detected by the electrical variations they produce.

Position of Objects on the Retina.—All objects refracted on the retina are inverted, and yet they are seen in the natural position. The probable explanation of this is, that the mind is not conscious of images on the retina, but of the external object which produces the image.

Accommodation of the Eye.—A normal E. is capable of seeing objects distinctly which are placed at almost any distance, and consequently there must be some power of accommodating or of focussing the E. for different distances. It has been ascertained that this is accomplished by the action of a small muscle, the *ciliary muscle (f g)*, which relaxes the anterior layer of the capsule of the lens, and thus allows the lens, by its elasticity, to become more convex anteriorly. This is effected for near objects. A reflection of a candle flame on the anterior surface of the lens has been observed to approach the cornea when the E. was directed to a near object. The radii of curvature have also been carefully measured, and it has been found that the length of the radius of the anterior surface of the lens diminishes for near distances; consequently the anterior surface becomes less convex for distant objects. The mechanism occurs without consciousness. For further details see Hermann's *Human Physiology*, p. 372.

Anomalies and Peculiarities of the Eye.—As an optical instrument the E. is not absolutely faultless, but the defects are so slight as not to be observable unless the attention has been carefully directed to them, with the aid of special apparatus. The chief defects are:—(1) *Chromatic aberration* (see ABERRATION). When the E. is accommodated for too near a distance, the margin of the field is blue, and for too great a distance the margin is of a faint reddish yellow. Thus the power of accommodation is not equal for all colours. (2) *Spherical aberration* is nearly corrected by the action of the iris cutting off a large amount of the peripheral rays which fall upon the E. by the ellipsoidal form of the refracting surfaces, and by the density of the lens being greatest in the centre or nucleus; but when the pupil is dilated, a certain amount of spherical aberration is always present, giving rise to circles of diffuse light, and consequently to indistinct images. (3) *Astigmatism.* In many cases it will be found that fine vertical lines made by chalk upon a black board can be seen distinctly from a greater distance than similar horizontal lines. This depends on the fact that the vertical meridian of the cornea is more arched than the horizontal, so that the two meridians have different focal distances. This is astigmatism, an error, which, if too pronounced, may give rise to much discomfort, which may be remedied by the use of cylindrical glasses. (4) All the media of the E. are slightly *fluorescent*. (5) The E. is so affected by *polarized* light, that when, for example, we look at the sky (the blue rays of which are already polarized), a peculiar tuft-like image is seen, usually called *Haidinger's image*.

The Blind Spot of the Eye.—The point of the retina which corresponds to the entrance of the optic nerve is insensible to light, so that any image falling upon it does not excite a visual sensation. This proves that the optic nerve can only be affected by light through the medium of the retina.

The Sensitiveness of the Yellow Spot.—This spot is most sensitive to light, and when we wish to obtain an accurate view of any object, we unconsciously so move the E. as to bring its image upon the spot. For example, if we fix our attention, without moving our eyeballs, on a word in the centre of a long line of print, we see that word distinctly, while the other words on each side of it are but vaguely noticed. But if we wish to see the words separately, the E. is insensibly moved by the action of its muscles along the line, so as to bring each word successively on the yellow spot.

Quality of Luminous Impressions.—Light consisting of vibrations of the ether of different wave lengths, it is evident that the quality of luminous impressions depends on the characters of the wave. For example, the intensity, or, in other words, the *height*, of the wave determines the intensity of the luminous impression—the greater the intensity the greater the impression. The phenomenon of simple *colour* appears to depend upon the *length* of the wave. Thus certain waves, such as those below the red of the solar spectrum, give rise to no luminous impression; shorter waves above these excite a sensation of red; still shorter, orange; still shorter, yellow, green, indigo, and lastly, violet, in which the wave lengths are very small. Beyond the violet there are no luminous impressions except those seen in Fluorescence (q.v.). As the number of impulses in the same given time, say a second, must manifestly be greater with short waves than with long waves, sensation of simple colour may be said to depend on the number of impressions within a given time. For further details see LIGHT.

Various Modes of Exciting the Retina.—The retina may be excited not only by light but by mechanical or electrical stimulation. Thus pressure on the eyeball produces peculiar haloes of colour termed *phosgenes*, familiar to all. When electrical currents pass through the retina, weak luminous sensations also occur. Santonin (q.v.) has the property of so affecting the retina as to give a yellow colour to the field of vision.

Persistence of Impressions upon the Retina.—If the retina be excited sufficiently, the excited condition persists for some time after the exciting luminous cause has ceased to act. This effect is termed the *after-image*. Thus by whirling a wire red-hot at one end, the luminous describes a circle before the eye. The ingenious toy called the 'wheel of life' or *thaumatrope* illustrates the same phenomenon. With reference to colour, it may also be shown by rotating a disk divided into sectors of different colours. In this experiment the quality of the impression is altered. Thus with sectors of red and blue we obtain purple. The after-images produced by coloured objects are those of the complementary colour. Thus red will produce a green after-image, and *vice versâ*.

Ocular Spectra.—Fatigue of the retina, or a blow upon it, or the action of various drugs, may produce spectra of various colours, which are transferred to the outer world with all the semblance of reality.

Entoptical Phenomena.—These are appearances due to opacities or obscurations of the refracting media of the E., which throw shadows upon the retina sufficiently intense to excite it. They appear in the form of dots, irregular crosses, rows of beads, &c., and their appearance is often associated with a disordered state of the health.

Binocular Vision.—Although two images are formed in the two eyes, we see only one object. This is explained on the hypothesis that there are *corresponding points* in the retina which, if simultaneously excited, give rise to a single luminous impression. In normal circumstances the E. is so moved by its muscles as to bring images on corresponding points. When this action is deranged, as in squinting or by the use of narcotics, or by pushing one eyeball a little to the side with the finger, we see double.

Short-sightedness.—This defect, termed *myopia*, is usually due to the fact that the antero-posterior axis of the eyeball is longer than normal, so that rays of light are brought to a focus in front of the retina. Thus a blurred image is formed. Myopia is remedied by the use of *concave* lenses in spectacles.

Far-sightedness, usually termed *presbyopia*, is due to the antero-posterior axis being too short, so that the image would be formed *behind* the retina, a defect remedied by the use of *convex* lenses in spectacles. The normal eye is usually said to be *emmetropic*.

Stereoscopic Vision.—When you look at any solid object, it apparently stands out in relief. This depends upon the fact that the two images of the object formed in the two eyes can never be completely united, according to the law of corresponding points, so as to give one single impression. There are therefore two separate *perspective* images upon the retina, which are so combined as to cause a portion of them to overlap, and thus give rise to the perception of relief.

Determination of the Magnitude and Distance of Objects.—As regards the magnitude of an object, that depends upon the size of the retinal image—the greater the image the greater will be the apparent size of the object. The size of the retinal image will of course depend on that of the *visual* angle, or the angle formed in the lens by two lines drawn from the extreme ends of the object. In determining distance, the mind judges by the size of objects in the foreground. Thus it is extremely difficult to estimate distances at sea or on a wide plain, owing to the absence of this element of comparison. In judging of nearer distances, the influence of the muscular sensation produced by the convergence of the eyes, and also the effort at accommodation (undoubtedly a very vague impression), aid the mind in forming an opinion. Another aid to the estimation of distance is the intensity of the light, which usually decreases with the distance.

The Compound Eye.—The organ of vision in all the *Vertebrata* corresponds in general characters to what has been above described, and constitutes what is termed a simple E.; but in insects and *Crustacea* we find facetted eyes, consisting of conical segments, arranged as seen in Fig. 3. Each of these segments, two of which are seen in *C*, consists of a lens (*c*), and of internal nervous filaments which are in connection with the terminations of the optic nerve (*n*). Each segment contains pigment (*r*), and is optically distinct from those adjoining it. Thus light will fall in the direction of the axis of each segment, and the animal will have as many fields of view as there are segments in its E. The compound E. resembles the retina inverted, so that the nervous elements of the compound E. correspond to the individual rods and cones of Jacob's membrane. In the compound E., however, 'each retinal element has a telescope arranged for one particular direction.' See Hermann's *Physiology*, and Beaunis's *Éléments de Physiologie Humaine*.

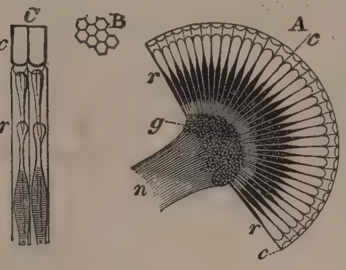

Fig. 3.

Comparative Anatomy of the Eye.—The first traces of organs of vision found in the animal world, as we proceed from lower to higher forms of life, probably occur in the *Protozoa* (q.v.), among the Infusorian animalcules, in which one or more spots of pigment may be seen. Whereever pigment is found in lower animals existing in definite masses, the naturalist is strongly inclined to attribute to such bodies the function of sight. Pigment spots, associated with lenses or refracting bodies, occur in the *Medusæ* or jellyfishes, in the sea-anemones and allied (Cœlenterate) organisms, situated around the margin of the swimming-bell in the former, and around the mouth in the latter forms. No nerves have been traced in the majority of *Cœlenterata*. In *Echinozoa*, such as star-fishes and sea-urchins, simple eyes or *ocelli* resembling those of Cœlenterates are found. Starfishes thus possess eyes at the tips of their rays, and in sea-urchins the eyes are situated at the upper pole of the shell, being borne on special (or *ocular*) plates. In *Annulosa*, the eyes may (as in worms, &c.) be of as simple character as in lower forms, but in such forms as insects, crustaceans, &c., large masses of simple eyes or *ocelli* are aggregated together to form large *compound* eyes, the separate *facets* or lenses in such eyes sometimes numbering many thousands. In *Mollusca* well-developed eyes, approaching in structure those of highest animals, may be found. The eyes of the *Cephalopoda* or cuttlefishes are thus of very complex structure, and of large size. Simpler eyes occur in *Gasteropoda* and *Lamellibranchiata*—the eyes of the latter class being well exemplified in the *pectens* or scallops, where they exist as numerous spots of pigment along the edge of the mantle lining the shell. In vertebrates, beginning with the fishes, eyes varying much in structure and adaptation to the element in which the animals possessing them live are found. The eyes of fishes are specially adapted to refract the straggling rays of light which pierce the dense medium in which they live. The lens of the E. in fishes is of spherical shape, and the entire structure of the organ is well adapted to constitute it a veritable magnifying instrument, in addition to its serving as a mere organ of sight. The eyeball is flat, little aqueous humour exists, and the pupil is large and motionless. In reptiles, a somewhat intermediate condition between the E. of the fish and that of higher vertebrates is presented. The chief structure of interest in the reptilian E. is the development of a third eyelid or *nictitating* membrane—also seen in some fishes (sharks, &c.), in birds, and in some mammals. This membrane is formed by a fold of the conjunctiva existing on the inner side of the E., and this fold, by means of special muscles, can be drawn over the surface of the E., so as to clear it from particles of foreign matter, and also to modify the light. In birds, the E. is generally protected by a ring of plates of bony nature, existing in the *sclerotic* or outer coat of the E. In *Mammalia*, variations exist in the E. structures, adapting the organs of vision for exercising their functions in various media—as in the case of the *Cetacea* or whales, seals, and other aquatic forms. But in essential structure the eyes of all *Mammalia* exhibit close agreement with the type of structure already described in man.

Diseases of the Eye.—Writers of systematic treatises on D. of the E. include under the term every injury and disease which interferes with normal vision. The nomenclature is thus very extensive, as normal vision may be interfered with from a great variety of accidents to, and disease of, parts contiguous to the eye, as the eyebrows, eyelids, and the orbits, as also the muscles regulating the movements of the eye and nerves supplying them. Some of these diseases, although not strictly ophthalmic, are so intimately connected with vision, as to warrant their being classed among D. of the E.; as *ptosis*, or falling down of the upper eyelid; *ectropium* and *entropium*, eversion and inversion of the eyelids; *hordeolum*, or stye; *trychiasis*, inversion of the eyelashes; *strabismus*, Squinting (q.v.). There are also diseases of the tunica conjunctiva and of the secreting and excreting lachrymal organs, of the semilunar membrane and *caruncula lacrymalis*, of the ocular capsule and the areolar and adipose tissue of the orbit, which interfere with vision. (See LACHRYMAL ORGANS, DISEASES OF.) The Ophthalmiæ (q.v.) are inflammatory diseases of the eyeball and conjunctiva, including sclerotitis, corneitis, iritis, choroiditis, retinitis, ophthalmitis, &c. Diseases subsequent to the ophthalmiæ, such as onyx, abscess of the cornea, specks or opacity, obliteration of the pupil, staphyloma, &c., obstruct vision or cause blindness. Cataract (q.v.), or opacity of the crystalline lens, is also a prominent disease of the eye, and a frequent cause of blindness. Obliteration of the pupil causes blindness. (See IRITIS, and PUPIL, ARTIFICIAL.) For an account of the nervous D. of E. see AMAUROSIS. There are also various affections of vision arising from peculiar or altered conditions of the refracting humours of the eye, as *myopia*, or near-sightedness, *presbyopia*, or far-sightedness. (See VISION, ABNORMAL; and COLOUR-BLINDNESS.) Blindness (q.v.) is occasionally caused by entozoa in the organ of vision. See ENTOZOA, and PARASITIC DISEASES.

Eye (Old. Eng. *Ig*, 'an island'), a town of England, in the county of Suffolk, 20 miles N. of Ipswich by rail. It got its name of 'island' from being situated between two streams, which unite here and fall into the Waveney. The principal industries are iron-founding, brewing, and the preparation of flax. It possesses a fine church of Perpendicular style of architecture, a corn exchange, town-hall, and grammar-school, 'restored' and enlarged in 1876-82. Pop. parl. div. of county 54,826; mun. bor., and civ. and ecc., par. (each) 2064.

Eye-Ag'ate, the name applied to any banded agate with a prominent central spot like the pupil of the eye. The name *eyestone* is given to stalactitic limestone, which presents a similar appearance.

Eye'bright, a species of plants of the genus *Euphrasia*, belonging to the natural order *Scrophulariaceæ*. They have a tubular calyx, a two-celled capsular fruit, with striated seeds, and the upper portion of the corolla divided. The common E., above named, attains a height of six or seven inches, has oval serrated leaves, and the flowers, coloured white or red, are developed in the axils of the leaves. It is abundant in Britain, also occurs in Europe, N. Asia, &c. Its popular name is derived from the conspicuous nature of its little flowers, and also from its having been used as a cure for eye diseases. E. is also interesting from the fact that some species appear to be partially parasitic on other plants.

Eye'mouth, a market-town in Berwickshire, Scotland, is situated on the river Eye. It is 7½ miles N.N.W. of Berwick-on-Tweed, is irregularly built, and the only buildings of note are the churches. It has profitable herring and haddock fisheries. Windbound vessels resort to the harbour, which is sheltered from all winds except the N. and N.E. Pop. civ. par. 2670; entire town 2638.

Eye'piece, of a telescope or microscope, is the lens or combination of lenses by which the image formed at the focus of the object glass is viewed.

Ey'lau, or **Prussian E.,** a town in the district of Königsberg, E. Prussia, 23 miles S. of Königsberg. Pop. town 3,523; district 52,924. E. has several industries, but is noteworthy chiefly for the battle fought here, 8th February, 1807, between the French, numbering 80,000, commanded by Napoleon, and the Allied Russians and Prussians, under Bennigsen and Lestocq. The Russians were 58,000 strong, but the Prussians were so pressed by Ney that only 5,500 were able to share in the combat. The battle lasted the entire day, and victory was claimed by both, but the French losses considerably exceeded those of the allies, which amounted to about 20,000.

Eyre, Edward John, a colonial governor, the son of a Yorkshire clergyman, was born in August, 1815. At the age of seventeen he emigrated to Australia, where his career was distinguished chiefly by his humane conduct, as resident magistrate, towards the aborigines, and by his explorations, which proved that there are no fertile spots in the central waste of Australia. In 1846 he was appointed Lieutenant-Governor of New Zealand. After holding this office for six years, he was made Lieutenant-Governor of St. Vincent, and *interim* Governor of the Leeward Islands. E. was appointed in 1862 temporary Governor of Jamaica, and in 1864 Governor and Commander-in-Chief of Jamaica. In October, 1865, he crushed a negro insurrection; but some sharp proceedings, and particularly the execution of George William Gordon, a coloured member of the Jamaica House of Assembly, on the ground that he had instigated the rebellion, caused such an outcry against him that he was superseded. Though a commission of inquiry to a great extent exonerated E., he was finally recalled. After E.'s return to England energetic efforts were made by those who disapproved of his policy to have him tried; but an 'E. Defence Fund' was raised by some of those who thought that his stern action merited praise rather than blame, and a charge of murder made against him before the Petty Sessions of Market Drayton, near which he had taken up his residence, was dismissed in 1867.

Eze'kiel (Heb. 'God strengthens,' or 'the strength of God'), the son of Buzi, was a priest in the temple at Jerusalem when, in the year 599 or 597 B.C., Jehoiakin the king, with the chief of the inhabitants, was carried off to Babylon. E. was one of the exiles settled on the river Chebar (perhaps the Chaboras, which flows into the Euphrates at Circesium). For his personal history we are entirely indebted to the book of his prophecies. According to chap. i., he received his prophetic call in a glorious vision in the fifth year of Jehoiakin's captivity. The latest date mentioned (xxix. 17) is the twenty-seventh, so that his prophecies extend over a period of twenty-two years. Of his subsequent fate nothing is known; he probably died in exile. The book of his prophecies contains twenty-nine utterances against the Israelites, especially the inhabitants of Jerusalem, made before the final fall of that city (i.-xxiv.); prophecies against some of the neighbouring tribes who were exulting over their overthrow (xxv.-xxxii.); nine utterances concerning the future condition of Israel (xxxiii.-xxxix.); and a series of visions relating to the circumstances of the people after the restoration (xl.-xlviii.). It is worthy of notice that the prophet's notion of God is a marked modification of previously existing ideas. With him the conception of Jehovah became purer and more elevated than before, but at the same time Jehovah is represented as much further removed from mankind. In the moral earnestness, combined with severity, of his own character E. has been compared to Calvin, and God is depicted by him exactly on the same pattern—one who sends good on the righteous man so long as he perseveres in his righteousness, but not a moment longer, and evil on the godless man, and him alone, while he also is rewarded immediately on his repentance (xiv. 12-23; xviii.; xxxiii. 10-20). The last part of the book is the most remarkable, on account of its relation to certain parts of the Pentateuch.

Ez'ra (Heb. 'help') was a Jewish priest at Babylon, who in the seventh year of the Persian king Artaxerxes (Longimanus, B.C. 465-425), with the permission and help of that prince, led a second company of the exiled Jews back to Jerusalem. Being deeply grieved to find his countrymen there living on such friendly terms with the heathen as to have intermarried with them, he appealed to them so powerfully that they all put away their heathen wives, and took an oath to keep themselves free from all heathen abominations. There is no further account of E., till, thirteen years after, in the 20th year of Artaxerxes, he is again at Jerusalem with Nehemiah (Neh. viii.). He is not mentioned after Nehemiah's departure from Jerusalem in the 32nd year of Artaxerxes, and it is not known whether he died at Jerusalem, or returned first to Babylon. The Book of E. is written partly in Hebrew and partly (iv. 8—vi. 18, and vii. 12-26) in Chaldee. As to the authorship, the second part (vii.-x.) was no doubt composed by E., although it bears traces (*e.g.*, vii. 1-6) of having been remodelled by a later hand. In the first part the chief difficulty is the letters sent to the kings of Persia—Xerxes (485-465) and Artaxerxes (Longimanus, 465-425)—by the Samaritans, and the answer of the latter to one of them (iv. 6-22). From the context (*cf.* ver. 23, 24) it would seem as if all these letters referred to the building of the temple, whereas it had been finished long before (516: vi. 15). In reality they refer to the fortification of the city (ver. 12, 13, 16, 21); and there is thus a confusion of persons and things which, it is thought, could not have been made by E., or by any one not writing at a later date.

Ezzeli'no, or **Ecceli'no, da Romano,** an Italian family, of German origin.—**E. I.** came to Italy about the middle of the 11th c., in the suite of Konrad II., from whom he received the castle of Romano near Padua, and several fiefs.—**E. II.** enlarged the family's lands, and commanded the forces of the Lombard league against Friedrich I. He died about 1183.—**E. III.,** son of **E. II.,** became podesta of Vicenza about 1150, and was a conspicuous Ghibelline chief. He died in 1193.—**E. IV.,** surnamed the Tyrant, was born 25th April, 1194, supported the Ghibelline cause, and in 1236, being hard pressed by the Marchese d'Este, sought aid from Friedrich II., was made captain of the imperial party, and extended his authority over Verona, Vicenza, Padua, Feltre, and Belluno. He contributed greatly to the Ghibelline victory at Cortenuova (27th November, 1237); in 1238 he married Selveggia, the emperor's natural daughter; and finally spread his power from the Adriatic to the neighbourhood of Milan. He consolidated his tyranny by horrible atrocities; and in 1252 he was excommunicated, and a league made against him by the chief Lombard towns, but without success. His career of aggrandisement continued until 1256, when, Alexander IV. having preached a crusade against him, a new alliance, joined by Venice, was formed to oppose him. In 1259, when marching on Milan, he was defeated and captured, whereupon he refused food, tore the dressings from his wounds, and died. His son Alberico was shortly afterwards killed, and E.'s lands were shared among his enemies.

F.

F the sixth letter of the English alphabet, occupying the same position in the Phœnician alphabet as *vau*, from which it has been derived through the Latin; in Greek its place was originally occupied, both in form and sound, by the archaic *digamma*. Its proper phonetic value, which is that of a softened *v*, must be carefully distinguished from the sound of *ph*, the Greek φ, which is really an aspirated *p*. In transliteration from Oriental languages this confusion often arises. But though these two letters are etymologically distinct, few languages retain both, and either can be forced to serve the purpose. The Greek *ph* is often represented in primitive Latin words by F, as *phuo* = *fui*, the same root as of Eng. 'be'; but in words directly borrowed, as *Philip*, it was retained; to be entirely discarded by modern Italian. The German pronunciation of *v* is hardly distinguished from our F. The interchanges of F are most numerous with the cognate labials and aspirates—Eng. 'father' is Ger. *vater* and Lat. *pater*; Lat. *fora* is Ger. *thura* and Eng. 'door'; Lat. *fero* is Eng. 'bear'; Eng. 'five' is Ger. *fünf*, Lat. *quinque*, and Gr. *pente*. As an abbreviation, F. stands for filius and Flavius in Latin, f. for *forte* and ff. for fortissimo in music, and FF. for *fragmenta*, used in referring to the Digest of Justinian. F. commonly stands for fellow, as F.R.S., Fellow of the Royal Society. F was also the letter formerly branded on felons in England who claimed the benefit of clergy. In the Middle Ages F was the symbol of the number 40, and in Arabic it represents 80.

F, in music, a note a perfect fourth above C. The vibration ratio F : C is equal to 4 : 3.

Faam′, or **Fa′ham,** a species of *Orchidaceæ* (q.v.), or orchids, found plentifully in the Mascarene Islands and the E. Indies. This plant is noted for the odour of its leaves, due to the presence of Coumarin (q.v.). The leaves are used in France for making an infusion popularly known as 'Isle of Bourbon tea,' greatly in vogue as a stomachic, and said to be also beneficial in consumption.

Faba′ceæ. See LEGUMINOSÆ.

Fa′ber, John, the name of two engravers in mezzotinto, of some repute in the 18th c., though of but little account now. The elder, who was born in Holland, and died at Bristol in 1721, besides engraving, drew portraits with the pen on vellum. His son, who died in London in 1756, was a superior artist. His best portraits are those of the beauties of Hampton Court, of the Kit-Cat Club, and of the Perceval family in the history of the House of Yvry.

Faber, Rev. George Stanley, an Anglican divine, was the eldest son of Rev. Thomas F., the descendant of a French Protestant refugee, and born 25th October, 1773. After a successful career at Oxford, where he became fellow and tutor of Lincoln College, he was made Bampton Lecturer in 1801, and his discourses were published the same year under the title of *Horæ Mosaicæ* (2nd ed. 1818). He married, and held various appointments, settling down finally in 1832 as master of Sherburn Hospital, near Durham, where he died 27th January, 1854. F. was a voluminous and popular writer on prophecy; among his works are *Dissertation on the Mysteries of the Cabiri* (1803); *The Origin of Pagan Idolatry* (1816); *Difficulties of Infidelity* (1824); *Papal Infallibility* (1851); *The Revival of the French Emperorship Anticipated from the Necessity of Prophecy* (1853).—His nephew, **Frederick William F.,** born 28th June, 1815, is notable for having, while an Anglican clergyman and Rector of Elton, been converted to the Roman Catholic faith (1845), and joining Dr. Newman's Oratory of St. Philip Neri. F., who was an eloquent preacher and voluminous writer both of prose and of poetry, became Superior of the Oratory at Brompton, and died 26th September, 1863. Among his works, several of which have been translated into French, German, Dutch, &c., may be mentioned *Sir Lancelot, a Poem* (2nd ed. 1858), *The Spirit and Genius of St. Philip Neri* (1850), and *Spiritual Conferences* (1859). See Bowden's *Life of F. W. F.*

Fa′bius, the name of an old Roman patrician family, whose members were distinguished in war, literature, and the arts. From 485-479 B.C. a F. constantly appears in the list of consuls; but according to the family legend, which passes for history, having been alienated from their fellow-patricians, the clan retired to the River Cremera, where (B.C. 477) they were destroyed by the Veientes, one youth, left at Rome, alone having escaped.—**Quintus F. Rullianus,** or **Rullus,** who first of the Fabian gens bore the surname Maximus, was the most distinguished Roman general in the second Samnite war. His march through the Ciminian forest, though a rash and hazardous step, was followed by a decisive victory over the Etruscans at the Vadimonian Lake, B.C. 310, and two years later he dispersed the Umbrians on the Upper Tiber.—**Quintus F. Maximus Verrucosus,** 'whose wise delay restored the Roman State,' was named the *Cunctator*, or the 'Lingerer,' from the persistence with which, in the second Punic war, he avoided all direct encounter with Hannibal. Appointed dictator after the disaster at Lake Trasimenus, his policy nearly achieved success when, following the invader on his retreat from Campania to Apulia, he closed the passes of the Appenines against him. Hannibal only escaped by a dexterous stratagem. The popular party at Rome misinterpreted the Fabian policy, and demanding more aggressive tactics, associated Minucius in command with the dictator; but the change of policy issued in the disgraceful rout at Cannæ (B.C. 216). In his fifth consulship (B.C. 209) F. recaptured Tarentum. He died B.C. 203. Mommsen pictures him as a man 'zealous in his reverence for the good old times, for the political omnipotence of the senate, and for the command of the burgomasters—one who looked, next to sacrifices and prayer, to a methodical prosecution of the war as the main means of saving the state.' **C. F. Pictor,** whose distinction as a painter acquired the name Pictor for a family of the Fabii. He lived about 300 B.C.—**Q. F. Pictor,** grandson of the preceding, flourished about 220 B.C. He was the earliest of the Roman annalists, and his work was of great value.

Fa′ble (Fr. *fable*, Lat. *fabula*, 'a narrative or story,' from *fari*, 'to speak'), a fictitious tale in prose or verse, in which animals or inanimate things are made to speak and act without regard to possibility, and which is intended to illustrate a moral truth or practical axiom, sometimes added to the story in the shape of a brief maxim called the *moral*. 'Jotham's F. of the trees (Judges ix.) is the oldest extant,' says Addison, 'and as beautiful as any made since.' Fables are especially popular in the East, and among the earliest known collections of them are Bidpai's (q.v.) or Pilpai's Indian and Lokman's Arabic fables. Some maintain the East to be the birthplace of F., and Max Müller traces La Fontaine's F. of the Milkmaid to a Sanskrit source. Among the most famous fabulists are the Greeks Æsop (q.v.) and Babrius (q.v.), the Latin Phædrus (q.v.), who recast the fables ascribed to Æsop, and added others of pure Roman origin, Aphthonius, a Greek prose writer, and Avianus, a Latin versifier of the 4th c., Planudes (q.v.), a Greek of the 14th c., Boner, and in modern times, La Fontaine (q.v.), who gave a novel piquancy to F. writing, Gay (q.v.), and the Spaniard Yriarte, who united the spirit of the Æsopian fables with the style of the Spanish romances. Fables were very popular in Germany in the 18th c., the best-known writers of them being Gellert (q.v.), Hagedorn (q.v.), Lichtwer, and Pfeffel. The greatest recent fabulist is the Russian Kriloff (q.v.), and many exquisite fables occur in Andersen's works. The most ambitious specimen of F. writing in England since Gay's time is the *Fables in Verse* of Lord Lytton ('Owen Meredith').

Fab'liau, pl. **Fabliaux** (formerly *fableau*, originally *fablel*, from Lat. *fabulellus*, a dim. of *fabula*, 'a story'), short, metrical tales written by the early French poets, which, unlike the *serventes* or songs of praise, the *tensons* or fantastic disquisitions on the 'art of love,' and the *lais* or miniature romances, were facetious and satirical, and mostly founded on proverbs and comic incidents. They are said to have originated at festive meetings, for which their brevity and piquancy were well adapted. While the *chansons de geste* deal with chivalrous adventure, the F. picture the humble and *bourgeois* life of the Middle Ages, and assail the vices and wrongs of the time, sparing neither king, baron, nor saint. Although stained with indecency, they evince fancy, pathos, and humour, bold satire, and greater narrative skill than the long rhyming romances. They belong principally to the 13th c., and are written generally in octosyllabic verse and in dialogue. Their sly banter and arch gaiety make them pleasanter reading than the prolix epics of the *trouvères*, or the lyrics embodying the amorous ritualism of the *troubadours;* and they were the delight and instruction of the people, until the Church, dreading their anti-clerical influence, made them a medium for orthodox doctrine. This brought them into popular disrepute; they died away during the 15th c., and their place was taken by the *sotties* or farces. From the F. arose the French comedy. In *Maistre Pierre Pathelin*, the first French comedy, we see the very spirit of the F., the same love for ludicrous incident and merry cajolery. Molière's *Médecin Malgré Lui* and *Georges Dandin*, and Piron's comedy of *Le Fils Ingrat* were founded on old F. The subjects of the F. were drawn from very varied sources—from the Old and New Testament, the *Acta Sanctorum*, the *Gesta Romanorum*, Apuleius, Ovid, and especially from the East. Many were adapted from the *Romance of the Seven Sages.* But notwithstanding their frequent Eastern colouring, their character is distinctly French; their authors are the earliest representatives of that peculiar *esprit Gaulois* which sparkles in Villon, Marot, Voltaire, and La Fontaine, preserving the same character in Rutebeuf and in Béranger. This peculiarly French quality, which we first find in the F., consists of a laughing, poignant irony, a frolic piquancy, expressed with Attic lightness and clearness, distinct alike from the boisterous humour of Rabelais and the prim, chill graces of the classical school. The *fablieri* have supplied innumerable themes to succeeding writers. From them La Fontaine drew many of his raciest stories, and Boccaccio most of the plots for his *Decamerone.* Chaucer was indebted to them for his tales of the Reeve, Frankeleyn, and Schypman. Stories now known through Europe were first popularised by the F.; for example, the tale of Griselda was retold by Chaucer and Hans Sachs from Boccaccio, who took it from a *fableor.* After the Conquest, Norman minstrels brought F. into England, where they were imitated in such poems as *Owl and the Nightingale*, and the story of *Sir Cleges.* The *fablieri* were not mere sprightly, licentious humourists. They were bold satirists, whose writings were a check on the priests and nobles, and who anticipated Cervantes in ridiculing chivalry. Among the most noted of them were Bernier, Gautier de Coinsi, Henri d'Andeli, Hughes Piancelle, Jean de Boves, Jean le Chapelain, and, especially, Rutebeuf, a wandering minstrel of the 13th c., the representative *fablier*, author of *Charlot le Juif*, *Moine Sacristain*, &c. The *Vert-Vert* of Gresset is a perfect modern specimen of a F. See Demogeot's *Littérature Française*, Besant's *French Humourists*, and Le Grand's *Fabliaux*, *Histoire de la Littérature Française*, by Charles Gidel.

Fabre d'Églantine, Philippe François Nazaire, was born at Carcassonne in 1755, and became a Jacobin leader in the French Revolution, joining Danton, La Croix, and Camille Desmoulins in all their terrible excesses. He represented Paris in the National convention, voted for the king's execution without appeal, and was nominated a member of the committee of public safety. He took an active part in passing the decree under which no English or Hanoverians were to be made prisoners. Falling under suspicion of holding moderate, or Royalist, principles, he was executed with Danton in 1794. His comedies were numerous and fairly popular at the time.

Fabrett'i, Raffaell'e, a famous Italian archæologist, born in 1618 at Urbino, repaired at an early age to Rome, and devoted himself to the study of its antiquities. His employments as Papal treasurer, chancellor to the Papal embassy at Madrid, and keeper of the papal archives in the castle of St. Angelo, gave him the best facilities for studying the classic works of the ancients. He is best known by his *De Aquæductibus Veteris Romæ* (Rome, 1680), his *De Columna Trajani* (Rome, 1683), and his *Inscriptionum Antiquarum, quæ in Ædibus Paternis asservantur, Explicatio* (Rome, 1699; 2nd ed. 1702). He died in Rome, 7th January, 1700. His valuable collections were deposited in the palace of Urbino.

Fabria'no, a city in the province of Macerata, Italy, 23 miles N.W. of the city of Macerata, has a cathedral and several churches containing numerous specimens of Italian sacred art. It has also been an important seat of paper manufacture for upwards of three centuries. Pop. 7910.

Fabriano, Gentile Da, an Italian painter, born at Fabriano about 1370, repaired at an early age to Florence to study under Fiesole. Among his first works were the fresco of the Madonna, preserved in the cathedral of Orvieto, which earned him the title of *magister magistrorum*, and an 'Adoration of the Kings,' for Holy Trinity Church, Florence, a work dated 1423, and one of the finest works of the school of Giotto. He afterwards painted sacred subjects for the churches of Sienna, Perugia, Gubbio, Fabriano, &c., and eventually removed to Venice, where the senate gave him the pension of one ducat *per diem* and the privilege of wearing the toga of the patricians, in recognition of the merit of his great fresco—a sea-fight between the Venetian fleet and that of the Emperor Barbarossa—painted for the council hall of the Doge's palace. The work was destroyed by fire in 1574. F. was employed by Pope Martin V. to decorate the church of San Giovanni Laterano, in which he painted the history of St. John, figures of several of the prophets, &c. He died in 1450. His works are bright and cheerful. Michael Angelo said of him, 'His genius is like his name—*gentile.*'

Fabri'cius or **Fabriz'io, ab Acquapenden'te, Geron'imo,** a famous Italian anatomist, was born at Acquapendente, near Orvieto, in 1537. He studied under Fallopius at Padua, where he was made professor of anatomy in 1565. F. soon became celebrated as a teacher, and his class-room was thronged by students from the various countries of Europe. After lecturing for fifty years he retired with a large fortune, and died at his country seat on the Brenta, 21st May, 1619. It was suspected that his heirs had poisoned him. Harvey, who attended F.'s lectures, states that his discovery of the circulation of the blood was suggested by F.'s remarks on the valves of the veins. F. wrote several Latin treatises on anatomy and surgery, showing careful, accurate investigation, and clear and vigorous in style. His complete works were published, with a memoir by Albinus, at Leyden in 1723, under the title *Opera Omnia Anatomica et Physiologica.*

Fabricius, Johann Christian, a Danish entomologist, born at Tondern, Slesvig, 7th January, 1743; studied medicine at Copenhagen, Edinburgh, and at Upsala under Linnæus; was chosen professor of natural history at Kiel in 1775; devoted himself to entomology; travelled over much of Europe, visiting Russia and England; and died at Kiel in 1807 or in 1808. His system of classification is by no means natural, yet entomology received from him a fresh impulse; and though later and better *savans* have pushed him into the background, he has a claim to be considered almost the founder of the science. His most important works are *Systema Entomologiæ* and *Supplementum Entomologiæ*.

Fabricius Lusci'nus, Cajus, figures in Roman history as a model of antique simplicity, courage, and patriotism. When consul in 282 B.C. he delivered the city of Thurii, which was besieged by the Lucanians and Bruttii, and subsequently defeated the Samnites. When Pyrrhus came over from Greece to assist the Tarentines, F. was sent to confer with him, after the defeat at Heraclea (280), about a ransom of captives. The Greek monarch offered him gold if he would try to induce the senate to make peace, but F. was proof against both his bribes and his threats. Pyrrhus was so much impressed with his patriotic fidelity that he restored the prisoners without ransom. During F.'s second consulship, 278, the physician of Pyrrhus secretly paid him a visit, and treacherously offered to poison his master for a reward. F. indignantly handed him over to the king, who again expressed his thanks by setting free all his Roman prisoners. While Pyrrhus was absent in Sicily, F. was victorious over the peoples of Lower Italy. He died poor, about 250, but the state charged itself with the upbringing of his only child.

Fabro'ni, An'gelo, an Italian biographer, born at Marradi in Tuscany, 1732, completed his studies at Rome. He wrote first in Latin, and afterwards in Italian; commenced at Pisa in 1771 his *Giornale de Letterati*, which at its close in 1796 formed 102 vols., and died at Pisa, 22nd September, 1803. Among his works are *Vitæ Italorum Doctrina Excellentium qui Sæculis XVII. et XVIII. floruerunt; Laurentii Medicei Magnifici, Vita; Magni Cosmi Medicei, Vita*, and *Elogi d' Illustri Italiani*.

Fa'byan, Robert, an English chronicler, born of a good Essex family in London, in the second half of the 15th c. He was a member of the Drapers' Company, and took an active part in civic affairs, becoming sheriff and alderman, and afterwards assessor of the London wards to Henry VII. He died 28th February, 1512. He wrote a *Concordance of Histories* (first printed in 1516), compiled from monkish annalists, and marked by a strong ecclesiastical bias. It gives the history of Britain from Brut to 1504, in English prose, and has a prologue and seven episodes in verse.

Façade' (Fr.; from the Ital. *facciata*, Lat. *facies*), a term in architecture which at first signified the principal front of a building, but is now applied to any front or face of an edifice. It is chiefly used in speaking of important buildings.

Facciola'ti, Gia'como, an Italian scholar, was born at Torreglia, near Padua, 4th January, 1682. He studied at the ecclesiastical seminary of Padua, of which he finally became the head. F. distinguished himself in criticism, grammar, antiquities, metaphysics, and theology, and wrote Ciceronian prose, but is remembered chiefly as a Latin lexicographer. He revised the lexicon of Schrevelius, and along with his pupil Forcellini produced a new edition of the *Calepine Lexicon*, or *Lexicon Septem Linguarum*. Finally, the same literary partners set to work to produce a new Latin dictionary, the basis of all subsequent dictionaries of the kind. F. did not live to see it completed (1771), as he died 26th August, 1769.

Face. The F. is composed of fourteen bones, of which twelve are in pairs, viz., the superior maxillary, molar, nasal, lachrymal, inferior turbinated and palate bones; and two single, namely, the vomer and inferior maxilla. It contains the cavities of the orbits, of the nose, and of the mouth. These bones are covered by the muscles of expression and of mastication, and by the contour of the bones, the degree of development of these muscles, and the amount of fat beneath the skin, the countenance in life is formed. The forehead, eyelids, nose, mouth, lips, and cheeks have sets of muscles by the movements of which the various emotions may be expressed. By absorption of fat and atrophy of muscle the F. becomes much altered in disease, and the near approach of death is characterized by a peculiar expression of countenance—the *facies Hippocratica*, thus described by the ancient physician Hippocrates: 'nose pinched, eyes sunk, temples hollow, ears cold and retracted, the skin of the forehead tense and dry, the complexion livid, the lips pendent, relaxed, and cold.' The arteries of the F. come from the external carotid; its veins end in the jugular; its nerves originate in the brain.

Face-Ache. See TIC-DOULOUREUX.

Fa'cet (Fr. *facette*, 'a little face'), the name applied to the small faces of a crystal or cut gem. Steel jewellery and other metal ornaments are often *facetted*.

Fa'cial Angle. This is an angle formed by two lines, one of them descending from the most prominent part of the forehead to the incisor margin of the upper jaw, the other passing through the external auditory opening and the nasal spine. It was intended by Camper, the distinguished ethnologist, to indicate by the size of this angle the degree of projection of the face in different races of men, and the relative development of the face to the cranium. The following are several facial angles which have been measured:—(1) Faces in antique works of art, 90° or even more; (2) average European, 80°; (3) European below the average, 70°; (4) Negro, 70°; (5) young anthropoid apes, 56° to 60°; (6) old anthropoid apes, 30° to 47°. See SKULL.

Facil'ity, a term of Scotch law denoting the mental condition of a person unable in an ordinary degree to protect himself from imposition. On sufficient evidence of F. being given against any one by his heir or next-of-kin, the Court of Session will 'interdict' him. (See INTERDICTION.) Any one conscious of the infirmity may place himself under interdiction. There is no corresponding term in English law, nor any similar remedy. See IDIOTS and LUNATICS.

Fac'tor, in mathematics, is one of the numbers or symbols which go to make up a given product. Thus in the expression $3ab^2\,(a^4-b^4)$ the factors are 3, a, b^2, and a^4-b^4; but of these the last two can be broken up into other factors, b, b, $a-b$, $a+b$, and a^2+b^2. This process of breaking up an algebraic expression into its *elementary factors* is of great importance in analysis. The term *factorial* is given to those continued products of consecutive numbers, beginning with unity, which constantly occur in series and expansions. Thus 1.2.3.4.5 is called *factorial* five, and is usually written $\underline{|5}$.

Factor (Lat. 'doer'), in a general sense, is any one who does business for another. In English law, a F. is the agent of a merchant or trader constituted by letter of attorney. (See ATTORNEY, LETTER OF.) A F. is generally paid by commission. If he buy goods on account of his principal when he is accustomed to do so, the contract binds the principal. But if the goods have been bought or exchanged without order, the merchant may refuse to take them from the F. Formerly the law was extremely hard on third parties in their transactions with factors. If an advance of money was made to one on the security of merchandise belonging to his principal, the principal was legally entitled to withdraw the security; and in the event of merchandise being bought from a F. not authorised to sell, the purchaser was liable, after paying the F., to have to pay the full value to the owner. To remove these hardships the Acts 4 & 6 Geo. IV. cc. 83 and 94 were passed, establishing the validity of contracts respecting merchandise entrusted to factors. Under 6 Geo. IV. c. 94 the person in whose name goods are shipped is declared to be the owner unless the contrary can be proved. The Factors Act of 1889 consolidated the law and amended it, and the law so amended and consolidated was extended to Scotland by the Factors Act of 1890. By the Larceny Act of 1861 a F. who obtained fraudulently an advance on the property of his principal is liable to seven years' penal servitude, &c.

In Scotland, the term F., besides its general legal meaning, which corresponds with the English, is especially applied to the manager for the proprietor of real (heritable) estates, for which the English equivalent is 'land-agent.' The great landowners have generally a F. resident on their estates, whose chief business it is to let the farms and draw the rents. The F. binds his principal to any engagement which he contracts within his powers. It has lately become to some extent customary to use the word *chamberlain* in Scotland as synonymous with F. in the above sense. Factors are also under certain circumstances appointed on estates in Scotland by the Court of Session. One so appointed is called a *Judicial F.* (q.v.).

Fac'tories and Mills, Law Regarding. Various Acts have been passed for the appointment of inspectors for the preservation of the health, and for regulating the education and hours of work, of children employed in M. and F. By 3 & 4 Will. IV. c. 103, children were required to attend a school chosen by parents or inspectors, to pay the expense of which one penny in each shilling was deducted from the child's earnings. It was rendered unlawful to employ children unless they produced weekly to the factory master the schoolmaster's ticket of attendance. Interior walls of mills and ceilings of rooms were to be limewashed yearly.

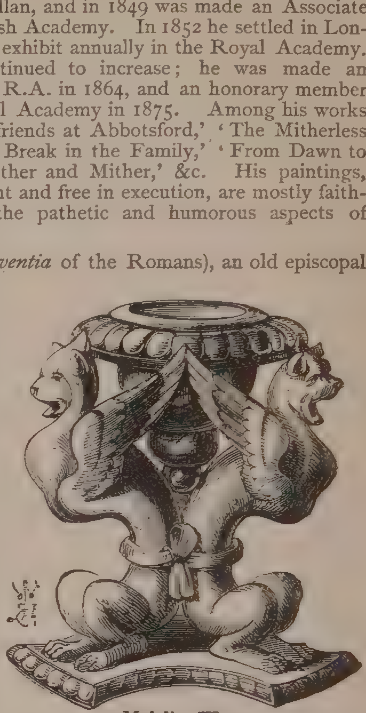
Act 7 & 8 Vict. c. 15 empowered inspectors to enter factories by day and night, to examine the inmates, the register, and other documents kept in pursuance of the Act. Penalties were imposed on persons endeavouring to prevent the examination of any child by the inspector, or otherwise endeavouring to impede him in the execution of his duty. Inspectors were empowered within limits to fix the surgeon's fees and appoint the times of his visits. The Act made stringent regulations for preventing injury to the health of children and 'young persons'—those between thirteen and eighteen years old—and for prevention of accidents from the machinery. By 16 & 17 Vict. c. 104, no 'child'—that is, one under thirteen years old—could be employed in any factory before six o'clock in the morning nor after six o'clock in the evening of any day, nor after two o'clock on Saturday. But between 30th September and 1st April children could be employed for one month on any day but Saturday from 7 A.M. to 7 P.M. The Factory and Workshop Act of 1878 consolidated and slightly amended these and other Acts bearing upon the same subject, and the Factory and Workshop Act of 1891 increased the powers of the inspectors, ordered means of escape from fire, prohibited the employment of children under eleven years of age, and women within one month after confinement. Any manufactory in which fifty or more persons are employed is under the Acts a factory. Statute 35 & 36 Vict. c. 61 placed the right of sanctioning or refusing the use of steam factory whistle with the local authorities. Children above eleven and under thirteen years of age may obtain half-time certificates on passing the prescribed educational standard, and may work to that extent in factories.

Fa'culæ, the brighter spots which are observed on the surface of the sun. The spots called *maculæ* are not so large or so bright.

Fac'ulty (Lat. *facultas*, 'a power,' 'means,' or 'opportunity'), in English law, is a privilege granted, under Statute 25 Hen. VIII. c. 21, to do something generally prohibited by law. There is a court for the purpose under the Archbishop of Canterbury or of York called the *Court of Faculties and Dispensations*, which has power to grant dispensations for a deacon under age to be ordained, and for exceptional procedure in other matters connected with the Church. The bishop of the diocese may grant a F. for a marriage without publication of banns; for erection of a monument, or for other addition or alteration in a church. See PEW.

Faed, John, a Scottish artist, son of a millwright, was born at Burley Mill, in the stewartry of Kirkcudbright, in 1820. He early showed a strong love of painting, and in 1841 went to Edinburgh, where in 1851 he exhibited several pictures, which soon made him widely known. In 1864 he removed to London. Among his works, which are mostly of humble Scottish life, are 'The Cottar's Saturday Night,' 'The Wappenschaw,' 'Tam O'Shanter,' 'Auld Mare Maggie,' 'John Anderson my Jo,' &c.—**Thomas F., R.A.,** brother of the above, was born at Burley Mill in 1826, joined the Edinburgh School of Design, where he received instruction from Sir W. Allan, and in 1849 was made an Associate of the Royal Scottish Academy. In 1852 he settled in London, and began to exhibit annually in the Royal Academy. His popularity continued to increase; he was made an A.R.A. in 1859, an R.A. in 1864, and an honorary member of the Vienna Royal Academy in 1875. Among his works are 'Scott and his friends at Abbotsford,' 'The Mitherless Bairn,' 'The First Break in the Family,' 'From Dawn to Sunset,' 'Baith Faither and Mither,' &c. His paintings, which are rich in tint and free in execution, are mostly faithful transcripts of the pathetic and humorous aspects of Scottish rustic life.

Faen'za (the *Faventia* of the Romans), an old episcopal town on the Lamone, in the province of Ravenna, N. Italy, on the railroad from Bologna to Ancona, and 20 miles S.W. of Ravenna. It is well built, four main streets branching off from the principal square, which is adorned with arcades and a fountain. The cathedral, courthouse, and theatre are the chief public buildings. F. manufactures articles of Majolica, known from the name of the town as 'Faience' (q.v.); also paper, silk, and linen. Pop. 36,490.



Majolica Ware.

Fæ'sulæ. See FIESOLE.

Fagel, Kaspar, was born at Haarlem in 1629, and became a celebrated Dutch statesman, Master of the Rolls in 1670 and Grand Pensionary in 1672. William III. owed his elevation to the English throne partly to the influence of F. In 1682 Comte d'Avaux, French ambassador in Holland, vainly offered F. a large bribe to win him over to the French side. F. died in 1688.

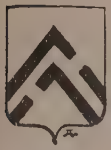
Fagg'ing, the name given to a system peculiar to the great public schools of England, by which the upper boys are authorised to exact certain services from the lower boys. The system is explicitly recognised by the masters, and the services demanded are regulated only by the traditions of each particular school; some of them are of a menial character, while others are connected with the common school games. F. no doubt arose from the two circumstances, formerly almost universal in England—that all the boys were permanent boarders, and that the staff of masters was too limited to exercise supervision out of working hours. The first of these circumstances naturally engendered a private organization among the boys, which the force of tradition has stereotyped, while the latter induced a semi-public sanction. Among day-boys the relation of master and servant could never have been instituted, and under ushers it would not have been allowed to take deep root. The advantages asserted of the system are that the fags are rendered handy, independent, and obedient, that an equality of condition is enforced upon all, and that bullying is indirectly suppressed. The evil is that the smaller boys are harassed by perpetual forced employment, which is often capricious, though seldom degrading. Freeman, in his *Growth of the English Constitution*, asserts that F. is a remnant of the old Teutonic custom of *commendation*, by which a free man became the 'man,' or obedient follower of a chief. A somewhat similar system, under the name of 'the Garring Law,' grew up in Heriot's Hospital, Edinburgh, in the middle of the last century.

Fahr′enheit, Gabriel Daniel, a German physicist, born at Danzig, 14th May, 1686, spent most of his life as a glassblower in England, and later in Holland, where he died, 16th September, 1736. About 1720 he improved the thermometer by substituting mercury for spirits of wine. (See THERMOMETER.) In the *Philosophical Transactions* for 1724 there are five papers by him, on the boiling and freezing of water, on specific gravity, and on a barometer of new construction.

Faid′herbe, Louis Léon César, a French general, born at Lille, 3rd June, 1818, served in Algeria, and as Governor of Senegal; commanded the *Armée du Nord* in the Franco-German war, and was beaten, greatly through the want of artillery, at St. Quentin, 17th January, 1871. He joined Gambetta's party, and was elected by the central canton of Lille to the National Assembly in 1871, but retired into private life on the success of the Thiers Government. In 1879 he was made a Senator. Besides proving himself an able soldier, F. wrote valuable scientific articles, a *Notice sur la Colonie du Sénégal* (1859) *Campagne de l'Armée du Nord* (1871). F. died 28th September, 1889.

Faïence′, or **Fayence,** an old French term formerly applied to all kinds of glazed earthenware, now restricted to fine kinds of pottery, with a soft, opaque paste, and glazed.

Failli, a term in heraldry, signifying a failure or break in an ordinary, and specially applied to a chevron divided into several pieces, as in accompanying diagram.



Failli.

Faill′y, Pierre Louis Charles Achille de, a French general, born at Rozoy-sur-Serre, Aisne, 21st January, 1810. He served in Algeria, distinguished himself in the Crimean war, and in 1867 won unenviable notoriety as the conqueror of Mentana. He held a command in the Franco-German war, and was captured at Sedan. F. was severely censured for incapacity by his countrymen, and was not reinstalled in command. Died in November, 1892.

Fai′néants Rois (Fr. 'do-nothing kings'), the name given to the Merwing kings, who nominally held the Frankish throne from the battle of Testry in 687 to the accession of the Karoling dynasty in 752. During this period the regal authority was wielded by the mayors of the palace. See FRANCE, HISTORY OF.

Fain′ting, or **Syn′cope** (Gr. *sun* and *koptō*, 'I cut, strike, smite'), is a state in which the circulation of the blood is suddenly arrested or much diminished in force and volume, causing a deadly pallor and loss of consciousness and power. F. is thus a state of suspended animation, varying in duration, and sometimes ending in death. F. usually takes place in the upright position, but not always, and the first symptoms are sudden pallor and falling down in a swoon. There are no spasms, as in hysteria, epilepsy, and convulsive affections; and no pulsations or respiratory movements, as in catalepsy. F. most frequently occurs to those of a highly nervous temperament. Those of very delicate constitution, or who may have suffered from exhaustive diseases or disease of the heart, are liable to attacks of F. from very slight exciting causes, such as the close atmosphere of a room or a start. The symptoms of F. and collapse, or shock, are similar, but the latter are much more serious, and are usually associated with accidents or surgical operations. *Treatment:*—The patient should be laid on the back, with the head and shoulders very slightly elevated; tight articles of dress should be loosened; and a current of cold air directed to the face and neck. Cold water dashed on the face, and ammonia or aromatic vinegar applied to the nostrils are highly useful in exciting the nervous system. The first symptoms of returning consciousness are twitchings of the muscles of the face, followed by a deep-drawn sigh. Artificial respiration, induced by compressing the ribs and allowing them to expand, as in natural breathing, rouses the respiratory movements. Friction over the region of the heart is also useful, and galvanism sometimes succeeds when all other means fail.

Fair, a privileged market regularly convened at a particular place on certain periods of the year. The word is probably derived from the Lat. *feriæ*, holidays, or days exempt from labour, which, after the establishment of Christianity, included days set apart for religious festivals in honour of the saints. On such occasions large numbers of people assembled round the monasteries. These gatherings became the origin of fairs, which were held on feast-days and Sundays. The German word *messe* signifies F. as well as Mass, a further indication of the relation between the Church and fairs. Numerous fairs are held at stated periods in various towns of the United Kingdom, chiefly for the sale of horses, cattle, and agricultural produce. Railways, and improved means of inland communication generally, have rendered many unnecessary, and diverted most from their original purpose to mere gatherings for merrymaking. Some had, indeed, become such great public nuisances, scenes of riot and dissipation, that their abolition was secured by the Fairs Act, enacted in May, 1871, which gave the Home Secretary power to abolish on the magistrates representing that the fairs were unnecessary and injurious and on the owner consenting. Bartholomew F., in London, established in the 12th c., ceased to exist in 1855; for two centuries it was a gross carnival. Throughout Europe and Asia, however, many fairs are still devoted to legitimate trade. Those of Leipzig and Nijni-Novgorod are the principal. At Leipzig annual fairs are now held at Easter and Michaelmas. Enormous trade is carried on, and the imports of the *Zollverein* and foreign manufactured goods steadily increase every year. Merchants from all parts of the world attend. The German book-trade, of which Leipzig is the great emporium, holds a half-yearly F. The annual F. of Nijni-Novgorod, sometimes called Macarieva, is the largest in the world. It begins early in July, and lasts over two months. Traders from all parts of Europe, Central Asia, and even China, frequent it. The F. is visited by over one million persons; the value of its imports amount to 180,000,000 roubles, and eight-ninths of that sum are actually realised by sales. Other Russian and Siberian towns have periodical fairs, and at Frankfurt-on-the-Main, Brunswick, Frankfurt-on-the-Oder, Vienna, Cassel, Breslau, Lyon, St. Germain, &c., considerable trade is similarly transacted. Among the English fairs may be mentioned the Horncastle Horse F., the Nottingham Goose F., the Birmingham Onion F., Ipswich Lamb F., Gloucester Cheese F., &c.

Fair′bairn, A. M., The Rev., M.A., D.D., was born in 1838, near Edinburgh, was educated at Edinburgh, Glasgow, and Berlin Universities, and in 1860 became minister at Bathgate, Linlithgow. He was appointed Principal of Airedale College, Bradford, in 1877, was elected Chairman of the Congregational Union of England and Wales in 1883, and three years later became Principal of Mansfield College, Oxford. Besides editing the Hibbert Lectures of Dr. Hatch and contributing to the *Contemporary Review*, he has written *Studies in the Philosophy of Religion and History*, *Studies in the Life of Christ*, *Christ in Modern Theology*, and *Christ in the Centuries*.

Fairbairn, Sir William, LL.D., F.R.S., an eminent engineer, was born at Kelso, Roxburghshire, Scotland, 19th February, 1789. After receiving an elementary education at the parish school of Mallochy in Rossshire, he became apprenticed to the trade of engine-wright at Percymain Colliery, North Shields. In 1817 F. was able to begin business for himself in Manchester as a machine-maker, and speedily won success and reputation. He is chiefly notable for being among the first to build iron ships, for substituting iron for wood in the shafting of cotton-mills, and for developing Stephenson's theory of tubular bridges, of which he successfully erected a large number. F. wrote various interesting papers, on such subjects as the tenacity of boiler plates, in the *Transactions* of the Royal Society and of the Philosophical Society of Manchester; and among his more important works are *Iron, its History and Manufactures* (1863), *Mills and Millwork* (1864-65), and *Iron Shipbuilding*. F., who during his later years had many honours bestowed upon him, such as the dignity of LL.D. of Glasgow, Fellow of the Royal Society, and corresponding Member of the Institute of France, held the office of president of the British Association for the Advancement of Science in 1861 and 1862, and in 1869 was made a baronet. He died 18th August, 1874. See Smiles's *Lives of Engineers*.

Fair′fax, Edward, son of Sir Thomas F. of Denton, Yorkshire, was born in the reign of Elizabeth. He spent a studious tranquil life near Denton, and died about 1632. His translation of Tasso's *Gerusalemme Liberata*, first published in 1600, under the title of *Godfrey of Bulloigne*, preserves the octave rhyme and much of the music and voluptuous splendour of the original; and notwithstanding occasional obscurity and undue license of fancy, remains an English classic and one of the best translations in our language. The edition published by Charles Knight has a brief memoir of the translator. F. also wrote eclogues, &c., now lost, and a treatise on *Demonology*. See Leigh Hunt's *Essay on F.'s Tasso*.

Fairfax, Thomas, Lord, an English general, son of Ferdinand, Lord F., was born at Denton, Yorkshire, in January, 1611. He served under Lord Vere in Holland, and when the civil war began in 1642, was made a general of cavalry in the army of the Parliament. In 1644 he defeated the Royalists under Bellasis, and commanded the right wing in the battle of Marston Moor. He succeeded Essex as leader of the Parliamentary forces, having Cromwell as his lieutenant-general, and commanded at the victory of Naseby in 1645. Henceforth, as Cromwell rose in power, F.'s influence lessened, though he was nominally commander-in-chief until 1650, when he resigned on being ordered to set out against the Scots, who had declared for the king. He then spent several years in retirement in Yorkshire, took part with Monk against Lambert in 1659, was elected member for Yorkshire in 1660, was one of the committee for promoting the Restoration, and died 12th February, 1671. F. wrote *Short Memorials of Thomas Lord F.* (1699), and several works in prose and verse.

Fair Head (Scand. *farr*, 'a sheep'), otherwise **Benmore Head** (*i.e.*, 'great hill head'), a promontory on the coast of Antrim, Ireland, 3 miles S. by E. of the island of Rathlin, and rising perpendicularly from the sea 636 feet. Geologically it belongs to the coal-measures, but columnar greenstone forms its upper portion.

Fai′ries, or **Elves.** Several derivations of the word *fairy* are suggested, among others the Celtic *faer*, 'to charm'; Old. Eng. *fere*, 'a companion,' from *faran*, 'to go'; and the Persian *peri*, pronounced in Arabic *feri*. The true root is probably the Lat. *fatum*, whence through the mediæval *fatare*, 'to enchant,' the Fr. *faer*, *feer*, from which came *faerie*, signifying first illusion, then the land of illusion, fairyland, and lastly an inhabitant of fairyland. Elf, on the other hand, is of Teutonic origin. It is the Old Eng. *ælf*, entering into the composition of many proper names, as Ælfred; the Ger. *elfe*, the Sw. *elf*, the Norse *alf*, and is perhaps connected with the Lat. *alb*-us, 'white,' in allusion to their ghostly appearance. F. are imaginary beings of supernatural but limited power, and generally of tiny stature, a belief in whom has been common to almost all countries of Europe. They include beings of very different aspects and qualities. In particular the F. of romance differ from the F. of popular superstition. The former somewhat resemble the Greek nymphs, appear generally as damsels of angelic loveliness, and seduce knights into enchanted isles and palaces. The land of faerie was supposed to be sometimes underground, sometimes amid wildernesses, and sometimes in the ocean. It possessed brilliant but illusory splendours, and mortals were occasionally decoyed thither and detained for many years. Fairy mythology varies with different nations. The *peri* of the Persians, which correspond to the good *jinn* of the Arabs, resemble the *fays* of European romance, being of human stature and exquisite loveliness. They live mostly in the air, and wage war with the *deevs*, or evil spirits. The Scandinavian *alfar*, or elves, were supposed to be partly kind and beautiful, partly malicious, and 'blacker than pitch'; while the *duergar*, or dwarfs, were expert in metallurgy and in forging magical weapons. The English F. are more playful and innocent than those of Scotland and Germany, and appear as graceful, sportive pigmies, fond of dancing at night in the woods, and of sharing in household duties. The English sprite *Robin Goodfellow* corresponds to the German *Knecht Ruprecht*, the Scotch *Brownie*, and the French *Esprit Folet*, or *Gobelin* (goblin). He assumes various forms, misleads travellers, and is constantly playing tricks on mortals. He will sweep the house, and thresh corn at midnight, but if in return a bowl of cream be not set out for him, ill-luck will befall the negligent housekeepers. He is the same as Shakespeare's *Puck* (Old Eng. *pouke*, 'an evil spirit'), and probably as Jonson's *Puck Hairy*. The Cornish *pixies* —according to Keightley a diminutive from *Puck*—are supposed to be the souls of unbaptized children. They dwell in the mines, and, as Will-o'-the-Wisps, mislead travellers, whence the term 'pixy-led.' The Scottish F. closely resemble the English. They were said to be small and handsome, to wear green dresses, to ride in splendid processions on Hallowe'en, and to indulge in moonlight revelry, marking the spots where they danced by circles of vivid green called *Fairy Rings* (q.v.). They were fickle and mischievous, kidnapping children to offer as yearly tribute to Satan, stealing the soul from the human body and replacing it by the soul of a fairy, and sometimes carrying away grown-up persons to fairyland. On this last belief are founded the ballad of *Tamlane* (see Scott's *Minstrelsy of the Border*), and Hogg's fine poem of *Kilmeny*. There is an element of sadness and fanciful weirdness in the Scottish tales of F. alien to the kindred English superstitions; thus, the *kelpie*, a wicked Scottish water-spirit, is unknown in the English rivers. The Gaelic F.—called *daoine shi* (dheenè shee), 'men of peace'—were said to inhabit turrets invisible by day but brilliantly illuminated at night. They enticed mortals into their abodes, and if these visitors partook of a fairy banquet, they forfeited the right to return to their fellow-men. According to tradition the Irish F. are the less wicked of the fallen angels, who were permitted to remain on earth. They have various names, apparently derived from *shia*, 'a spirit.' Among them are *pooka*, corresponding to the English *Puck*, who takes the form of a wild colt and indulges in evil frolics; *leprechaun*, a miserly spirit in the form of an old man; the *merrow*, or sea-maid, and the *banshee*, or guardian-spirit of a particular family. The F. of English poetry are different from the F. of popular superstition. Chaucer's F. are partly classic, partly Gothic, having Pluto and Proserpine for king and queen; Spenser's are idealized mortals; and the lovely diminutive spirits of Shakespeare's *Midsummer Night's Dream* are original creations, ruled by Oberon and Titania, who were unknown in the vulgar fairy superstitions. Oberon is *Le Petit Roy Oberon* who figures so conspicuously in mediæval fiction, and holds an intermediate place between the fays of romance and the elves of the north. He is the German Elberich, which the French softened into Oberon. Titania seems a derivative from Titan, since Diana, whom Ovid (*Metamorphoses*, iii. 173) styles Titania, was at one time regarded as a ruler of the F. The name of the tiny queen is thus derived from a word implying colossal stature and strength. Queen Mab, who in a certain degree has usurped the place of Titania, derives her name from the Welsh *mab*, 'a child.' There are frequent allusions to the F. in the Elizabethans, but, next to Shakespeare, Drayton, in *Nymphidia* and the *Poet's Elysium*, has been the most successful poet of fairyland. Fairy-tales became very popular in the last half of the 17th c. The *Contes de ma Mère l'Oye* (1697) of Perrault produced numerous imitations. Among recent authors of fairy-tales Hans Andersen stands unrivalled. See Keightley's *Fairy Mythology* (Bohn, Lond. 1860); Scott's *Essay on the F. of Popular Superstition*, in the *Minstrelsy of the Border*; Grimm's *Haus- und Kindermärchen*; and

Andrew Lang's collection of bright and interesting fairy-tales.

Fair Isle (Scand. *farr*, 'a sheep'), an island midway between the Orkney and Shetland groups, 29 miles S. by W. of Sumburgh Head, fully 3 miles long and nearly 2 broad, rising into three lofty promontories (one of which, 'Sheep Craig,' gives name to the isle), and accessible only at one point on the N.E. After the defeat of the Spanish Armada in 1588, its admiral, the Duke of Medina Sidonia, retreating northwards, was wrecked on F. I. The inhabitants live mainly by fishing. Pop. reg. dist. 223.

Fairy Rings, the name popularly given to green spots marked out in pasture lands, from the belief that they represented the meeting-place of fairies and elves. According to Roget, the occurrence of F. R. is explained by the exhaustion of the soil. The dark-green grass of the F. R. has been traced to the growth of fungi which have spread outwards. As the soil becomes deteriorated, the fungi spread themselves further and further outwards, in the form of successive and concentric circles. The succeeding grass crop which grows therein becomes necessarily more luxuriant than the surrounding grass, the soil having been enriched by the decay of the fungi. Way states that fungi which form F. R. (such as *Agaricus oreades* and *A. graveolens*) contain a large quantity of phosphoric acid and potash, which of course tend to enrich the soil.

Fairy Shrimp, a genus of *Crustacea* (q.v.) belonging to a different order from that (*Decapoda*) in which the true shrimps are included—viz., to the order *Phyllopoda* (q.v.). They are so named from their delicate clear appearance. They occur in ponds, &c., in England and elsewhere. Their average length is about 1 inch, yet so clear are their bodies that they can scarcely be detected as they swim back-downwards. They have numerous feet, which are leaf-like in form.

Faith, in the widest sense of the word, is assent to the truth, or the persuasion of the mind that a thing is true. Thus the primary element of it is trust, as the primary idea of truth is that which is trustworthy; and it might be defined as a rational trust beyond the limits of knowledge, but founded upon it. It is often defined as if it were a special organ for the perception of a special kind of truth, but improperly so, although the complex state of mind involved in the act is, of course, different according to the nature of the object of F., and of the evidence on which it is founded. The ordinary definitions of F. may be divided into three classes:—Those founded (1) on its subjective nature; (2) on its object; (3) on its evidence. I. In the first class, F. has been defined as 'a persuasion of the truth stronger than opinion and weaker than knowledge'; otherwise, according to Locke, 'an assent of the mind to propositions which are probably, but not certainly, true'; or, according to Kant, 'the admission of a thing to be true on grounds sufficient subjectively, insufficient objectively.' Secondly, it is said to be a *voluntary* conviction or persuasion of the truth; which definition, however, admits of a number of meanings according to the sense attached to 'voluntary.' Thus it may mean that F. is not merely a speculative assent, but includes feeling; or, that F. does not depend on the nature of the object or the evidence, but on our choice to believe or disbelieve. II. Under the second class, F. is defined as the persuasion of the truth of things not seen. Here, again, 'sight' may be taken in three senses:—(1) Literally; we are said to know a thing which we have seen with our eyes, and to believe in the existence of things of whose existence we are certain without having seen them. (2) As mental perception; and we are said to believe on testimony what we might afterwards see or know by demonstration. (3) 'Things not seen' may mean all things not present to the mind; and we are said to know only the actual and the present, while what is mediately known, *e.g.*, by memory, is only believed to be. III. Under the third class, F. is defined to be (1) A conviction or persuasion of truth founded on feeling, not because of critical or philosophical research or of argument, but determined by inclination and inward necessity. (2) F. is a persuasion of the truth founded on testimony, and the F. of the Christian is the persuasion of the truth of the facts and doctrines recorded in the Scriptures on the testimony of God.

Having defined F., theologians further divide it into different kinds:—1. Speculative or dead F. is the F. of those who believe the Bible to be the Word of God, receive all it teaches, and are perfectly orthodox, while yet they may be leading an immoral life. 2. Temporary F. is that temporary impression, more or less deep and lasting, produced by the gospel—*e.g.*, in the apprehension of death—and which is due to those influences of the Spirit of God common to all men. 3. Saving F. is that which makes us the sons of God, and secures eternal life, and is founded 'not on the external or the moral evidence of the truth, but on the testimony of the Spirit with and by the truth of the renewed soul.' See Hodge's *Systematic Theology*.

Faith, Rule of, means a standard by which Christians are to be guided in what they believe in religious matters. The phrase originated with the early Christian fathers, but had a different meaning in the Greek and in the Latin Churches. In the latter, as, *e.g.*, in the writings of Irenæus, Tertullian, Novatian, and Jerome, R. of F. was, in fact, but a name for the Apostles' Creed, which was so called 'because it was the known standard of faith, by which orthodoxy and heresy were judged.' If a man adhered to this rule, he was considered orthodox; but if he deviated from it in any point, he was esteemed a heretic, one who had deserted the common faith and separated from the communion of the Church. In the Greek Church, on the other hand, as, *e.g.*, in the writings of Clement of Alexandria, the R. of F. meant an exegetical tradition or principle, by which the true meaning of Scripture was educed.

In modern times, all are agreed as to the meaning of R. of F. as regards its application, but there is a difference of opinion between Protestants and Roman Catholics as to what constitutes the standard. All Protestants hold that 'the Word of God, as contained in the Scriptures of the Old and New Testaments, is the only infallible rule of faith and practice.' According to Roman Catholics the R. of F. includes Tradition as well as the Scriptures, because 'some doctrines which all Christians are bound to believe are only imperfectly revealed in the Scriptures, others only obscurely intimated, and others not therein contained at all.' With regard to the Scriptures themselves, the Church of Rome differs from Protestants in admitting into the canon certain books which Protestants do not admit to be inspired, namely, the Apocrypha (q.v.). Further, while Protestants hold that the Bible is intelligible by all under the teaching of the Holy Spirit, and that therefore all are entitled and bound to search the Scriptures and judge for themselves what is the true meaning thereof, the Church of Rome teaches that the Bible cannot be properly understood by the people without a visible, present, and infallible interpreter, which interpreter exists in the Church, and the people are therefore bound to believe whatever the Church believes to be the true doctrine. With regard to Tradition, which the Church of Rome also holds to constitute a part of the R. of F., it teaches that many things were taught by Christ and his apostles which were not recorded in the New Testament, but which have been faithfully preserved and transmitted by the Church, and are now to be found, for the most part, in the works of the fathers, decisions of councils, ecclesiastical constitutions, and rescripts of popes. See Davidson's *Sacred Hermeneutics*, Bingham's *Ecclesiast. Antiquities*, Hodge's *Systematic Theology*.

Faithfull, Emily, born in 1835, at Headley Rectory, Surrey, took an active part, at an early stage of the movement, in the improvement of the condition of working-women. In 1860 under her was founded a printing office, with machinery and works, in which women were employed as compositors. For some years E. F. edited the *Victoria Magazine*, which was printed and published at this establishment, and in 1868 brought out a novel, called *Change upon Change*. She lectured in America in 1872-73, and on her return continued her good work among the toilers of her sex.

In 1889 a civil list pension of £50 was awarded her. Died in 1895.

Fai'thorne, Faithorn, or **Faythorne, William,** an English engraver, was born in London about 1625, took up arms for Charles I. in the civil war, was imprisoned, and afterwards went to France, where he seems to have come under the professional influence of Philippe de Champagne and of Nanteuil, and considerably modified his style as an artist. Returning to England in 1650, he entered upon a thriving business as a print-seller and engraver. Among his best portraits are those of Cromwell, Milton, Dryden, Hobbes, Prince Rupert, and Queen Anne (when Princess of Denmark). F., who wrote in 1662 an essay on *The Art of Graveing and Etching*, died May, 1691.

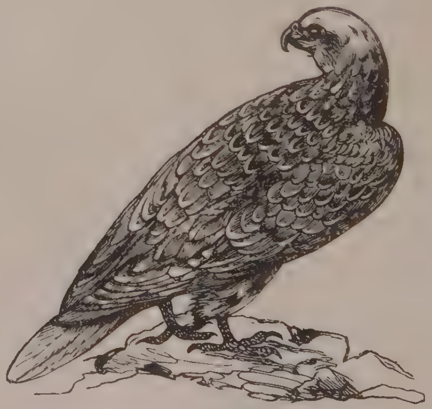
Fakir', a name derived from the Arabic *faquír*, 'poor,' and applied, especially in India, to religious mendicants who wander through the country, and are universally respected for their sanctity and self-mortification. It does not appear that their austerities have any necessary connection with their particular faith; but they are rather to be derived from the singular spirit of devotion and indifference to pain which has characterized the religions of the East from the earliest times. They bear a close resemblance to the hermits of primitive Christianity, and also to the mendicant friars of later history. In India they are divided into classes, named either from their founders, or from a peculiarity of habit or doctrine. Some are accustomed to inflict the severest wounds upon themselves, or to endure discomfort or even actual pain from such practices as, holding an arm extended till it becomes immovable, being suspended head downwards from the branch of a tree, or being buried up to the chin in the ground without any protection to the head from sun, cold, rain, or insects; and this without complaint or expression indicative of a desire to escape from their bodily miseries. They travel from one end of the peninsula to another, and have been known to penetrate as far as Europe. In Persia and Turkey this class of holy men is represented by the dervishes. Their counterparts among the Hindus are termed Sanyasses and Byragees. According to the last census there were in India 2,717,861 persons who were classed as Fakirs, devotees, &c.

Fakirs performing penance.

Falaise' (Fr. 'the cliff-town,' from Scand. *fell* or *felsen*, 'a rock'), a town in the department of Calvados, France, built on a natural terrace close by a rocky height, 23 miles S.E. of Caen. Remains of its ancient walls, and of the castle in which William the Conqueror was born, still exist. Its churches, and many of its houses, recall vividly the Middle Ages. The chief industry, the trade in leather and furs, has been carried on for centuries. Pop. town 8313; arrond. 48,489.

Castle of Falaise.

Fal'con, the name applied to various genera and species of Raptorial birds, included in the family *Falconidæ* (q.v.). In the typical genus *Falco*, the bill is strong and toothed at its tip. The cere is small, and the nostrils are round, having a central tubercle. The wings have their second and third quills longest, the first and second being notched near the tip. The feathers of the tarsi hang over the knee. The toes are long and powerful, and the talons strong. These birds are among the most typical of the *Raptores*. They exhibit the special structure of that group, and exemplify the bold, wary nature common to the eagles and other forms. The best-known falcons are the Jer or Gyr F., the Peregrine F., the Hobby, the Lanner, the Merlin, the Kestrel, the Notched F., &c. The name F. is given to various members of the kite sub-family (*Milvinæ*). Thus, the Crook-billed F. and Cayenne F. belong to this sub-family. The American Red-throated



Gyr-Falcon.

F. belongs to the sub-family *Polyborinæ*, and the Rough-legged F. to the *Buteoninæ* or Buzzards.

Falco'ne, Aniell'o or **Angelo,** an Italian painter, was born at Naples in 1600, took part in Masaniello's insurrection, afterwards visited Paris, and died at Naples in 1665. Salvator Rosa was one of his pupils. His fame as a painter of battle-pieces was at one time so great as to earn him the title, in Italy, of 'Oracle of Battles.' His paintings are spirited and natural in design, and brilliant without being glaring in colour. See Lanzi's *Storia della Pittura*, vol. ii.

Fal'coner, William, an English poet, born at Edinburgh, 11th February, 1732; entered the merchant service; and when eighteen became second mate of a vessel which was wrecked (1750) off Cape Colonna, F. and two others alone being saved. This disastrous voyage is the subject of F.'s *Shipwreck*. Through the influence of the Duke of York, to whom the *Shipwreck* (1762) was dedicated, F. joined the navy in 1763, and was lost at sea, when purser of the *Aurora* frigate, in 1769. The *Shipwreck* has passages of vigorous and pathetic description, but is essentially commonplace in structure and idea; while the contrast between F.'s frequent nautical technicalities and the names and conversation of his characters, who seem borrowed from a Queen Anne pastoral, jars upon the reader, and lessens the interest. F. wrote several verses of circumstance deservedly forgotten; *The Demagogue* (1765), an attack on Wilkes and Churchill; and a *Universal Marine Dictionary* (1769). The once popular song, *Cease, rude Boreas*, has also been attributed to him. See the Memoir by Stanier Clarke prefixed to his edition of the *Shipwreck* (1804), and that by Mitford in the Aldine edition of F.'s *Poetical Works*.

Fal'conet, a small cannon in use during the 15th and 16th centuries, which discharged a ball weighing about 1¼ lb.

Fal'conet, Étienne Maurice, born at Paris in 1716, became a pupil of Lemoine, and for his statue of Milo of Crotona was elected an Academician at Paris in 1745. On the invitation of the Empress Catharine II. he proceeded to St. Petersburg, where he spent twelve years over a colossal bronze equestrian statue of Peter the Great, which is considered admirable and his best work. He returned to France in 1778, wrote a commentary of Pliny's sculpture and painting, and died at Paris in 1791.

Falcon'idæ, a large and well-known family of Raptorial birds, the members of which are distinguished by the fact that the bill has a partial cere, and is of compressed form, having the keel curved from the cere to the tip. The wings are long and pointed, and the tail broad. The tarsi are varied and of strong make, the claws being curved and sharp. The head and neck are feathered, and the eyes appear sunk and overarched by the brow. This family includes several well-marked sub-families. Chief of these are the *Aquilinæ* or Eagles (q.v.), the *Polyborinæ* (including the Caracaras and Brazilian kites), the *Buteoninæ* or buzzards, the *Milvinæ* or kites, the *Falconinæ* or falcons proper, and the *Accipitrinæ* or sparrow-hawks, &c. The F. are found in all parts of the world.

Fal'conry or **Hawk'ing,** the art of training Falcons (q.v.) and birds of Raptorial kind to pursue other birds in flight and capture them. The practice of F. dates from a remote period. It was probably derived from the East, and was most in vogue in England during the Middle Ages. The birds chiefly pursued as game were the heron, partridge, lark, pigeon, wild-duck, &c. The falcons used in the sport were the Peregrine (q.v.) and Gyr-Falcon (q.v.); but the Goshawk (q.v.) and Sparrow-Hawk (q.v.), birds of less powerful flight than the two former species, were also employed. The female birds, as a rule, were most valued by the falconer. They seemed to possess powers of endurance, agility, and cunning wanting in the males. The species which was most in favour was the peregrine falcon, which, when taken early from the nest and trained to the sport, excelled the other species in dexterity, and in the readiness with which it lent itself to the exercise. The course of training undergone by these birds was of a very complete and lengthy character. The falconer preferred to take the bird from the nest, but his art was, in lieu of nestlings, also practised on older birds. The young or nestling was named the *eyess*, and on being taken from the nest was carefully tended by the falconer, and was lodged in some outhouse, being fed on flesh of various kinds. Becoming thus familiarised with man, the *eyess* grew tamer. The food was generally attached to a *lure*—an apparatus consisting of a bunch of feathers, a cord, and tassel. The object of thus feeding the falcon was to accustom it to recognise the lure, and to associate it with its food; this association afterwards serving to recall and entice the bird to the falconer when its chase was unsuccessful. Another form of lure was that known as the *tabur stycke*, consisting of a short stick on which the semblance of a bird was borne; and a third form of lure was named the *drawer*. As the bird's powers of flight became developed, the lure was used to entice her back to hand after permitting her to fly abroad. The operation which was most important in the falcon's training is that known as *hooding*. This consisted in placing on the bird's head a close-fitting leather cap, made so as to cover the eyes, but to allow the protrusion of the beak. This procedure often repeated had the effect of making the bird tame and docile. The bird thus hooded was set on a 'block' of wood, and was secured thereto by an apparatus of *bells* and *jesses*; the former being two hollow metal globes attached by *bewits* or leather straps to the legs of the bird; whilst the jesses were leather bands 5 or 6 inches in length, and fixed to each leg below the bells. The jesses, in turn, were attached to another strap—the *leash*—by means of *varvels*, or two rings of silver, on which the owner's name was engraved. The apparatus thus described ultimately became permanent parts of the falcon's harness; and in addition to these structures, a long cord, named the *creance*, was tied to the leash, and served to afford further and wider scope to the movements of the bird in training. It was also trained to sit or perch itself steadily on the hand of its master or mistress. The falcon was further taught to circle and hover round the falconer, the lure being made use of to this end. The bird mostly pursued of old was the heron. The prey or *quarry* was attacked in its homeward flight against the wind. The falcons being unhooded, were cast off, and sought a greater elevation than the prey, on which they successively *stooped* or *swooped* down. If the first missed its aim, the second hawk *stooped* in like manner, the heron being soon seized. The falconer drew off the hawks from the prey after all three had descended, luring them by means of live pigeons and other birds. The heron was rarely killed outright, but was frequently liberated, being first marked with the name of the falcon's owner. It often proved a powerful adversary while on the ground, striking at the falcons with its powerful beak, and sometimes transfixing them. The Merlin (q.v.) is chiefly used for the capture of larks and other small birds, and the goshawk may be employed to secure pheasants, and even rabbits and hares. A special terminology, of which some examples have been given, characterized the sport. The most celebrated training-place for falconers was the village of Falconswaerd, near Bois-le-Duc, in Holland. Several old and a few modern treatises exist on F.; the best-known of the latter is Freeman and Salvin's *Falconry*. Within recent years there has been an attempt to revive the ancient pastime of H.

Faler'ii, an Etruscan city, W. of the Tiber, and N. of Mount Soracte. It first appears in Roman history (B.C. 437) as the enemy of Rome, and after the fall of Veii it was besieged by the Romans under Camillus, whose treatment of the treacherous schoolmaster is a familiar fable. The friendly relations then established with Rome were broken on several occasions, and finally (B.C. 241) the inhabitants (called *Falisci*) were expelled from their old city and founded a new one, on whose site the 'Colonia Falisca' was subsequently established by the triumvirs. In the Middle Ages another city, named *Civita Castellana*, appeared on the site of the old F.

Faler'nian Wine occupied the second rank among the ancient wines of Italy. It was produced in a district of Campania, stretching from the Massican Hills to the river

Vulturnus, and known as the *Falernus Ager*. The best variety was the *Faustianum*. Owing to neglect, the vineyards ceased to produce good crops, and before the 6th c. they had been grubbed up and the soil was cultivated for other purposes.

Falie′ri, an ancient Venetian family, several members of which held high offices in the state, and one of whom took part in the election of the first doge in 697. The most notable was **Marino Faliero**. He was born about 1284, and at the siege of Zara in 1346 defeated 80,000 Hungarians, at the same time checking the besieged. Appointed commander of the fleet, he took Capo d'Istria, and afterwards, while absent as ambassador at Rome, was chosen doge in 1354. In the following year, enraged because the Council of Forty passed what he thought too slight a sentence on a nobleman, Michele Steno, who had libelled the doge's young wife, F. conspired to overthrow the republic and win the sovereignty. The plot was betrayed, and the chief conspirators were executed. F. was beheaded, 17th April, 1355, on the stone staircase where the doges took the oath after election. F. seems to have been brave, violent, and unforgiving. He was a personal friend of Petrarch, who mentions him in his letters. Among the pictures of the doges in the hall of the Grand Council is a space veiled and inscribed 'Hic est locus Marini Faleiro, decapitati pro criminibus.' See Byron's *Marino F.*, Marino Sanuto's *Vite de' Duchi de Venezia*, and H. Greenhough Smith's *The Romance of History*.

Fal′kirk (perhaps 'the kirk on the *Vallum*' or wall of Agricola; the Gaelic name is *Eglais-bhrac*, 'the speckled kirk'), a town of Stirlingshire, Scotland, 22 miles E.N.E. of Glasgow, and 25 W. by N. of Edinburgh. It is in the immediate vicinity of extensive ironworks, of which the best known are the Carron, which have given name to a peculiar kind of ironmongery, and to a piece of ordnance known as a carronade, because both are made at Carron. Several fire-brick, tile, and chemical works are in the neighbourhood. F. has also famous trysts or cattle-fairs, known by its name. Two battles have occurred in the neighbourhood, the first in 1298 between the troops of Edward I. and the Scotch under Wallace, in which the latter was completely defeated; and the second between the royal forces and those of the Chevalier, Prince Charles Edward Stuart, in 1746, in which the former were repulsed. F. became a royal burgh in 1646. Along with Airdrie, Hamilton, Lanark, and Linlithgow, it sends one member to Parliament. Pop. civ. par. 30,731; entire town 19,769; and parl. burgh 16,620.

Falk′land, an ancient burgh of Fifeshire, Scotland, 10 miles S.W. of Cupar, its charter dating from 1458. F. Palace, a famous royal residence, has given distinction to the place. It is mentioned by Sir David Lyndsay in his *Complaynt of the Papingo* as the 'forteress of Fyfe.' James IV. lived here, and on his death his widow, Henry VIII.'s sister, was imprisoned within the Palace for a time. James V. died here in 1542. In 1650 Charles II. resided here for a few days. Hand-loom weaving is the chief employment. Pop. civ. par. 2470; town 1045; and royal burgh 959.

Falkland Islands, otherwise the **Malouines′** or the **Malvi′nas**, an archipelago in the S. Atlantic belonging to Britain, and lying 300 miles E. of Magellan's Strait. They consist of two large islands, E. and W. F., and of about 200 smaller, with an area of 6500 sq. miles, and a pop. of 1789, of whom 1666 are natives. They were discovered in 1593 by Richard Hawkins, but it is only since 1833 that they have formed a British settlement, though they have been a British possession since 1771. Previously they had belonged in succession to France and Spain. These islands are principally valuable from their numerous commodious harbours. The pasturage is good, and the surrounding seas teem with fish; seals also abound. Port Stanley, in E. F., is the seat of the government, which consists of a Governor, assisted by an Executive and a Legislative Council. Neither military nor naval forces are maintained here. The chief exports are sheep, frozen mutton, wool, tallow, hides and skins. Sheep, cattle, and horses are reared here; of the first-named there are close on 700,000.

Falkland, Lucius Cary, Viscount, was born at Burford, Oxfordshire, in 1610. His father, Henry Cary, Viscount F., filled for a time the post of deputy-lieutenant in Ireland, and F. was educated at Trinity College, Dublin, and St. John's College, Cambridge. Inheriting from his grandfather an estate worth £2000 a year, he devoted himself to learned research, and was on terms of friendship with such men as Selden and Chillingworth. In 1640 he entered the House of Commons as member for Newport in the Isle of Wight, and at first took an active part on the side of Hampden and Pym, and against the illegalities of the king and his tools. Ultimately, however, he separated from the popular party. After a vain attempt at mediation between King and Parliament, he espoused, though with sad forebodings, the side of the former in the civil war, fought gallantly at Edgehill, and fell in the first battle of Newbury, 20th September, 1643. He was an author both in prose and verse, his best-known work being a *Discourse on the Infallibility of the Church of Rome*. Green, in his *Short History of the English People*, p. 525, finely describes him as 'the centre of a circle which embraced the most liberal thinkers of his day, a keen reasoner and able speaker, whose convictions still went with the Parliament, while his wavering and impulsive temper, his love of the Church, his passionate longings for peace, his sympathy for the fallen, led him to struggle for a king whom he distrusted, and to die in a cause that was not his own.' See Forster's *Historical and Biographical Essays*.

Fall, The, is the name given by theologians to the sin committed by our first parents in disobeying the command of God and eating of the forbidden fruit in the garden of Eden, as described in the third chapter of Genesis. The details of that narrative, which are familiar to every one, have always been interpreted by theologians with a greater or less departure from the literal sense. Thus the ordinary interpretation is that the serpent was only a figurative designation of Satan, or actually Satan in disguise, or, at least, that the serpent, if real, was employed by Satan as his organ or instrument. According to this view, the effects of the disobedience recorded in the narrative were merely subordinate expressions of the divine displeasure, and consequences of that which was the real and primary effect, namely, spiritual death or absolute ruin analogous to that of the fallen angels; so that the F. is the very basis of the whole system of Christian theology, necessitating, as it does, the Atonement, which indeed is obscurely predicted in the words of God to the serpent:—'It (the seed of the woman) shall bruise thy head, and thou shalt bruise his heel.' Others, however, regard the serpent of the narrative as a real animal, but the narrative itself as a fable or allegory intended to explain philosophically the origin of evil, physical and moral, in which allegory the tree of Life represents spirituality, the tree of Knowledge sensuality, the serpent being the symbol of pleasure. According to this view, which has been held by some of the learned from the earliest times, *e.g.*, Philo, Clement of Alexandria, Origen, Eusebius, Augustine, &c., the allegory teaches 'that as soon as man's mind, through the weakness and treachery of his senses, became captivated and seduced by the allurements of lust and pleasure, he was driven by God out of Paradise, that is, lost and forfeited the happiness and prosperity which he had enjoyed in his innocence.' For the theological bearings of the F., see ORIGINAL SIN.

Traditions of a F. from a state of original innocence and happiness are to be found among every nation possessing a cosmogony and theogony. According to the Hindus, the first man was tempted by the Supreme Being, whose special symbol was the serpent, by means of a blossom dropped from heaven of the sacred Indian fig. Instigated by his wife, who had derived her being from him, the man determined to possess the blossom, with the expectation that it would make him immortal, and on gathering it actually believed himself to be so; but on the appearance of the deity the pair were banished from the Paradise in which they were. The Persian account, contained in the Zend-Avesta, is as follows:—'The first couple lived originally in purity and innocence. Perpetual happiness was promised to them by Ormuzd, the creator of every good gift, if they persevered in their virtue. But an evil demon was sent to them by Ahriman, the representative of everything noxious and sinful. He appeared unexpectedly in the form of a serpent, and gave them the fruit of a wonderful tree, Hom, which imparted immortality, and had the power of restoring the dead to life. Thus evil inclinations entered their hearts; all their moral excellences were destroyed. Ahriman himself appeared under the form of the same reptile, and completed the work of seduction. They acknowledged him instead of Ormuzd as the creator of everything good, and the consequence was that they forfeited for ever the eternal happiness for which they were destined.' A likeness has been remarked between the Greek myth of the garden of the Hesperides—in which was a tree with golden apples, guarded by a speaking dragon, the possession of which conferred immortality—and the story in Genesis, for which also some of the designs might stand as illustrations which appear on the ancient Greek gems and Etruscan pottery. To account for the similarity existing among all these traditions one school of divines supposes them all to have been derived from the Hebrew Scriptures, the oldest literature in existence; another school holds the theory that the Jews derived their literature on the early history of the human race from the Babylonians and Persians during their captivity in Babylon. The latter view has moreover received apparent confirmation from the discoveries of Chaldæan literature made by G. Smith. On the terra-cotta tablets dug from the ruins of Assyrian cities by himself and others he has discovered accounts of the creation, F., deluge, &c., corresponding almost exactly, as far as the narrative on the tablets yet found goes, with those in Genesis, except that they are fuller. See Kalisch's *Commentary on Genesis*; C. Middleton's *Works*; G. Smith's *Chaldæan Account of Genesis*.

Fall'acy (Lat. *fallacia*) is the technical name given in logic to an error which arises not in observation by the senses, but in reasoning, or in the interpretation of what is directly seen. The line between fact and inference, between the original sense-impression and the form and colour which it receives from the mind, is no doubt hard to trace. A great many unapparent details are filled in unconsciously, and therefore the leading rule of all scientific inquiry is to remove, or minimise, or allow for the errors of observation. It is a F. to omit observation altogether, or to unduly limit its range; but every F. assumes a fact truly ascertained, which the mind then proceeds to distort. Fallacies might, therefore, be classified according to the particular kind of reasoning, inductive or deductive, in which they occur. In books on formal logic, where alone syllogistic reasoning is (at least properly) treated, they are classified according to the canon of consistency violated. Elsewhere, as in Bentham's *Book of Fallacies*, or Bastiat's *Sophismes Économiques*, the leading errors on a particular subject are collected and analysed. But before we reach fallacies of inference or reasoning, there is (1) A class of natural prejudices, called by Mill 'fallacies of simple inspection,' which are held by the mind as self-evident, *i.e.*, without conscious reference to evidence. The strength of these prejudices often depends on the feelings as a remote predisposing cause, but the form of intellectual error is much the same in all cases, viz., that the course of nature must correspond to the current of human thought. Under this class come most cases of omens, unlucky days or names, &c. Similar fallacies, however, may be found in philosophy and in cultivated opinion—*e.g.*, things we cannot think of apart must exist together, and things which we cannot think of together cannot coexist; every clear idea must correspond with an object—a principle at the root of the systems of Descartes, Spinoza, and Leibnitz; a thing can act only where it is; nature always works by the simplest means; the belief in the separate existence of abstract qualities or class names; the principle of sufficient reason, according to which nature does a certain thing because man can see no reason why she should not; the idea (held by Bacon) that there must be only *one* cause of the sensible qualities of objects; or that entertained by many metaphysicians, that the conditions of the phenomena must, or probably will, *resemble* the phenomena itself, exemplified in the medical doctrine of signatures, that the virtue of every substance is pointed out by some external character. (2) Another important class of fallacies is called by Mill 'fallacies of observation,' which consist in either *non-observation* or *mal-observation*. The mind is moved by the marvellous, and is also biassed by preconceived opinion or the desire to establish a particular conclusion. Hence comes a disposition not to observe, as in the famous Copernican dispute about the stone falling from the ship-mast. Or where a particular instance is examined, material circumstances may be overlooked, *e.g.*, the phlogistic theory, in which the gaseous products of combustion were overlooked. Mal-observation arises for the most part from the tendency, above alluded to, to confuse perception with inference, or sensation with judgment. (3) Fallacies of *generalisation*, in which inferences are drawn from the order of things in the known to that in the unknown universe, *e.g.*, the attempts made to analyze into one things generically distinct, as heat, light, and sensation into motion; the 'induction by enumeration,' or *per enum. simplicem*, of the ancients. A more special form is that called in formal logic *post hoc ergo propter hoc*, where a true cause is inferred from casual conjunction, as in the line of political reasoning which justifies existing institutions from the contemporaneous prosperity of the commonwealth. Common language is saturated with metaphor, especially with subtle exchanges of meaning between the bodily and the spiritual, and it is difficult to state a proposition on any complex subject without tacitly suggesting several very questionable trains of thought. (4) Fallacies of *ratiocination*, or what are generally given in works on formal logic. These include wrong conversion of universal affirmative and of hypothetical propositions. It is constantly supposed that, because the premises cannot be true if the conclusion is false, therefore the premises cannot be false if the conclusion is true. In the opposition of propositions, too, it is often forgotten that contrary propositions, though they cannot both be true, may both be false. The ordinary syllogistic fallacies all consist in having more than three terms, either expressly or by undistributed middle or *illicit process* of extremes. Frequently the premises are changed in argument, as in the scholastic *a dicto secundum quid ad dictum simpliciter*, an absolute rule is substituted for one qualified. Examples of this are the mercantile theory in economics (which left out of view in its conclusion the purchasing power of money), and the argument that tithes fell on the landlord because, *under the tithe system*, the owner of tithed land received less than the owner of tithe-free land. (5) Fallacies of *confusion*, which include all those fallacies that consist not so much in mistaking the force of evidence, as in an indistinct notion of what the evidence is. The chief is the F. of an ambiguous middle, where the middle term of a syllogism is ambiguous, or one of the syllogistic terms is taken in one sense in the premises, and in another sense in the conclusion. Etymology in this way becomes a prolific source of erroneous reasoning. In the F. of composition and division something is established separately concerning each *single* member of a certain class, and then the same is inferred of the whole *collectively*. The *petitio principii*, or reasoning in a circle, occurs where the premise is the same as the conclusion, or can be proved from it alone. It is quite common, when discussion does not run to first principles, to prove A by B, though B really depends on A for proof. The conclusion, abstractly stated, often serves for a premise, and the words nature and essence are very useful in this connection, and what Bentham calls 'question-begging appellatives,' *e.g.*, innovation. The *ignoratio elenchi* consists in the establishment of an irrelevant conclusion, a particular for a universal, or some proposition which excites the feelings. See the treatises on logic by Whately, Mill, De Morgan, and Sir William Hamilton.

Fall'en Angels. It appears from certain passages of Scripture that some of the angels 'kept not their first estate' (Jude 6), but 'sinned' and were 'cast down to hell' (2 Pet. ii. 4). The Apocalypse, with greater minuteness, tells that the archangel Michael and his angels made war against the dragon (Satan) and his angels, and prevailed, and the dragon was cast out, and his angels were cast out with him (xii. 7-9). These F. A. are thus the Demons (q.v.) who are so ready to obey the behests of their master the Devil in afflicting mankind, although St. Jude and St. Peter speak of their being bound in chains till the judgment day. It also appears from Eph. i. 21, vi. 12 (*cf.* iii. 10, Col. i. 16, 1 Pet. iii. 22), that the same grades existed among them as among those who had not fallen. As to the nature of the sin which led to their fall various opinions have been held. Some have thought it was lust, founded on Gen. vi. 2; others envy; but it is generally held to have been pride, from 1 Tim. iii. 6.

It is asserted by some, however, that all this doctrine of the Devil and his angels was derived by the Jews from the dualistic ideas of the Babylonians and Persians during their Babylonian exile (see DEVIL), and that the allusions to the F. A. in the New Testament are derived from the Book of Enoch (q.v.), in which the following passage occurs:—'To Michael also the Lord said, Go, and announce his crime to Samyaza and to the others who are with him, who have been associated with women. . . Bind them for seventy generations underneath the earth . . . until the judgment which will last for ever be completed. Then shall they be taken away into the lowest depths of the fire in torments, and in confinement shall they be shut up for ever' (x. 15, 16). Be that as it may, the Babylonians had fuller traditions than the Jews about the fall of the dragon and his angels, as appears from Chaldæan literature discovered comparatively recently. See G. Smith's *Chaldæan Account of Genesis; Book of Enoch.*

Fallmeray'er, Philipp Jakob, a German historian and traveller, was born of poor parents at Tschötsch, near Brixen, in Tyrol, 10th December, 1791. He studied at the universities of Salzburg and Landshut, devoting himself chiefly to history and philology. After serving in the Bavarian forces against Napoleon he was made a master in the gymnasium at Augsburg, and afterwards held the chair of philology at Landshut. From 1831 to 1834 he travelled in Egypt, Palestine, Syria, and Greece; and in 1840, and again in 1847, visited the East. He was elected to the Frankfurt Assembly, but shortly retired from public life. He died at Munich, 26th April, 1860. His *Gesammelte Werke* were edited by Thomas in 3 vols. (Leipz. 1861).

Fallo'pius or **Falloppio, Gabrie'llo,** a famous anatomist, was born at Modena about 1523. He studied science in various universities throughout Europe, and in 1551 became professor of anatomy at Pisa. He died in 1562. F. was one of the earliest restorers of anatomy, but several discoveries claimed by him have been traced to Greek and Arabic physicians—*e.g.*, the two tubes called the *Fallopian tubes* were not discovered by him, having been accurately described by Herophilus and Rufus of Ephesus more than 300 years B.C. See the collected edition of his works, entitled *Opera genuina omnia, tam practica quam theoretica* (Ven. 1584; Frankf. 1600).

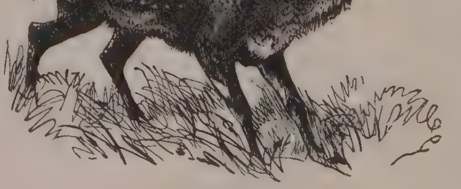
Fallopius, Aqueduct of, a canal in the fibrous portion of the temporal, which transmits the facial nerve. It passes outwards and backwards over the labyrinth of the Ear (q.v.), and terminates at the stylo-mastoid foramen. On the anterior and upper surface of the bone there is a small foramen named the *hiatus Fallopii*, which transmits the large superficial petrosal nerve.

Falloux, Frédéric Alfred Pierre, Vicomte de, a French writer and statesman, was born at Angers in May, 1811. His family, as a reward for loyalty, was ennobled at the Restoration, and he himself showed his legitimism in two works—the history of Louis XVI. and the history of Pope Pius V.—published in 1840 and 1844 respectively. In 1846 he was elected the representative of Maine-et-Loire, and in 1848 favoured the formation of a republic. On Louis Napoleon becoming President he was appointed Minister of Public Instruction, having previously reported in favour of doing away with the national workshops. (See article ATELIERS NATIONAUX). In 1849 he retired from office, became a member of the French Academy in 1857, and occupied himself with literature till his death in 1886.

Fall'ow (Old Eng. *fealo*, a pale or reddish yellow; *cf.* Ger. *falb* and *fahl*, allied to Lat. *fulv*-us), a term in agriculture applied to land left bare of any crop for a season to free it from weeds, and to improve the mechanical condition of the soil. The practice of fallowing is one of very ancient origin, having been inculcated in the Mosaic law, which commanded that the ground should rest every seventh year. It was well known to the ancient Romans, by whom fallowing was introduced into England; but it was not till about the beginning of the 18th c. that the practice was begun in Scottish agriculture. Originally all kinds of land were fallowed indiscriminately; but the introduction of green crops, such as potatoes and turnips, had the effect of greatly limiting the area of land to which the system was applied. Now what is termed 'bare or summer F.' is only applied to very stiff retentive clay soils such as are found in the 'carse' land of Scotland, the fen clays of Huntingdon and Cambridgeshire, and the weald clay of Kent and Sussex in England. On the lighter soils the periodical cultivation of green crops effects the same object, and is known as 'green-crop F.' Land under bare F. is ploughed up immediately on the removal of the crop, and so exposed to the rains, frosts, and atmospheric influences of the winter. In spring it is again ploughed across, and on very stiff soils it may receive as many as six or eight ploughings, besides scarifying and harrowing throughout the season. The soil so treated is thoroughly exposed to the oxidizing influences of the atmosphere, and to the action of the carbonic acid contained in the air, as well as that dissolved in every shower of rain. While the land is thereby rendered more mellow and friable, the mineral substances which enter into the constitution of cultivated plants are fitted for assimilation, and injurious weeds are at the same time thoroughly eradicated. Of the 56,771,728 acres constituting the total area of Great Britain, there were in 1893 514,558 of bare fallow or uncropped arable land, and in 1894 the amount had been reduced to 375,701; while of the 20,706,258 acres constituting the total area of Ireland, there were in 1893 22,038, and in 1894 19,639 as bare fallow or uncropped arable land.

Fallow Chat. See WHEATEAR.

Fallow Deer, a species of *Cervidæ* or Deer (q.v.) nearly allied to the Stag (q.v.), but distinguished by its spotted coat, its smaller size, and the spreading palmated horns. The colour of the F. D. is a reddish brown spotted with white, and usually exhibiting a few whitish lines on the body. In winter it assumes a darker tint. The average height is about 3 feet at the shoulders. The food consists of grasses of various kinds. The original habitat of the F. D. is unknown. Tradition points to S. Europe or W. Asia as its probable home; but it is rarely, if ever, met with save in a domesticated state.



Fallow Deer.

F. D. are largely kept in parks and grounds. They are very docile, and readily tamed, the herd being governed by a 'master deer.' The flesh affords good venison, and from the skin leather is manufactured; while the shavings of the horns are used in making ammonia—hence popularly named 'hartshorn.' The females are hornless. The young are named *fawns*, the females *does*, and the males *bucks*.

Fall River, a city of Bristol county, Massachusetts, U.S., at the mouth of the Taunton River, on Mount Hope bay, 48 miles S. of Boston. It has calico printworks, woollen factories, cotton mills, large ironworks, and a bleaching business. It has also deep-water navigation, and is a port of steam-boat communication with New York. It possesses a free library, two public parks, daily and weekly newspapers, &c. F. R., which was founded in 1659, was incorporated as a town in 1803, and as a city in 1854.—*Fall River*, which gives name to the town, is a small stream that joins the Taunton River not far from its mouth. It is of great utility for its water-power. In its last half-mile it descends about 130 feet, its banks being lined with extensive mills.

Fal'mouth, a town of Cornwall, England, at the mouth of the Fal, and formerly a station for the packet-boats to the S. of Europe and the W. Indies, 92 miles S.W. of Exeter and 266 W.S.W. of London. It is connected with Plymouth by railway. The harbour, which is of unusual depth and capacity, was formerly defended on the E. and W. respectively by St. Mawes and Pendennis castles, built by Henry VIII. and strengthened by Elizabeth. The chief exports are tin, copper, granite, and fish (pilchards, oysters, &c.); the chief imports are timber, grain, flour, wine, hemp, fruit, and guano. The mun. bor. of F., that of Penryn, the parish of F., parts of the parishes of St. Gluvias, Budock, and Mylor, and the village of Flushing, return one member to Parliament. Pop. reg. subdist. 14,076; civ. par. 6925; mun. bor. 4737.

False Bay, a capacious inlet of the Southern Ocean in Cape Colony, S. Africa, the S.W. boundary of which is formed by the Cape of Good Hope. It is about 22 miles long, and as many broad. The northern part of F. B. is called Simon's Bay and, being naturally well protected and affording good anchorage, has been chosen as the station of the British fleet in S. African waters. Several forts and batteries increase the security of the harbour in case of war. Usually a fleet of 15 men-of-war is stationed here and along the W. coast.

False'hood, Le'gal, is defined to be a fraudulent imitation or suppression of truth to the injury of any one. *Forgery* and *swindling* are the main branches of the crime. See these articles; also FRAUD.

False Impris'onment consists in the unlawful detention of the person. All forcible confinement, even in a street, is by the law regarded as imprisonment. Legal restraint of the person must be by warrant of a court of law or legal officer, or by special power warranted by statute or common law, such as the obligation on every man who sees an act of felony committed to arrest the felon. (See APPREHEND.) F. I., however, may arise from executing a legal process at an illegal time, as by arresting in a civil process on Sunday. The imprisonment being committed under error is no excuse. An action for damages sustained by the party confined for loss of time and liberty lies with him against the wrongdoer. The corresponding Scotch law term is Wrongous Imprisonment (q.v.). In England the safeguard of the subject is his power to require a court of law to issue in his favour a writ of Habeas Corpus (q.v.) *ad subjiciendum*.

False Point, a harbour at the mouth of the Mahanadi River, in the district of Cuttack, province of Bengal, British India, 196 miles S. of Calcutta. In 1860 it was first formed into a port, though a lighthouse had been previously erected and buoys laid down; it now ranks as the best harbour between the Hoogley and Bombay. Ships cannot proceed up the river, but native boats now bring down produce from the town of Cuttack and Orissa through the Kendrapara Canal, and a small steamer serves between the harbour and Cuttack. Over 150 vessels, representing a tonnage of 200,000 clear the port, and the trade, which consists chiefly of rice and oil-seeds, is now estimated at £300,000, whereas thirty years ago it barely reached £10,000. The place is now less unhealthy than it used to be. The Orissa famine of 1866 first brought the capabilities of F. P. prominently to the front and since then connecting canals have been made and it has been recognised as the best entrepot for the province.

False Pretences, Obtaining Money by. To constitute this offence there must be a specific fraudulent misrepresentation of matter of fact by which property is obtained. If a man purchase goods, promising to pay for them next day or on some other specified day, should he fail to do so the failure is merely in an engagement. But if he obtain the goods in exchange for a cheque on a banker, stating falsely that he has funds in hands of the banker to meet the cheque, he commits the crime in question. But in a case in which a man induced a banker to pay his cheque by drawing a bill on one on whom he had no right to draw, the act was adjudged not to be a false pretence because he only obtained credit. It would have been otherwise had he obtained money on the bill. The distinction is a fine one, and obtaining credit by fraud is now punishable under the Bankruptcy Acts. Statutes 24 & 25 Vict. c. 96 and 27 & 28 Vict. c. 47 consolidated previous legislation on the subject, and made the offence a misdemeanour and placed the punishment at five years' penal servitude or two years' imprisonment. A minor obtaining money or goods by pretending to be of age may be punished as a common cheat. Under the Acts, any one fraudulently inducing another to sign his name or to execute any document is guilty of felony, and liable to three years' penal servitude. Bills of exchange and all negotiable securities are included under this provision.

In Scotland the crime in question is punishable under common law. See FRAUD, SWINDLING.

False Return, Legal, renders the officer who makes it liable in damage.

False Swearing. See PERJURY, AFFIRMATION, DECLARATION. Under the English Bankruptcy Acts, if the bankrupt make a false declaration, he is guilty of perjury. Under the Scotch Act, any one under oath is liable to prosecution at the instance of the Lord Advocate, or of the trustee in the sequestration, with concurrence of the Lord Advocate.

Falsett'o, a high register possessed by many male voices. It is seldom agreeable in itself, or used in serious concerted music.

False Verdict may arise from improper behaviour of the jury among themselves, or of the plaintiff towards them, by which their verdict is influenced, from misdirection of the judge, or from exorbitant award of damage. Formerly a writ of attaint could be issued at the application of the injured party against the jury; if they erred on a point of law and according to the judge's direction no steps could be taken against them. Now, the verdict is set aside and a new trial granted. But if two juries return the same or a similar verdict, a third trial is seldom conceded. The universal rule now is that a juryman cannot on any ground be punished for his verdict.

False Weights and Measures. Possession of these for purpose of trade is in England punishable under common law. The penalty is fine or imprisonment. In Scotland the users of false weights knowing them to be below the standard they profess to be (which will be presumed against the users) are by statute liable to punishment by penal servitude or imprisonment.

Fal'sifying Rec'ords. Any one forging or fraudulently altering, &c., any original document in legal process or any copy of it used or intended to be used in evidence in any court (named in section 27 of statute 24 & 25 Vict. c. 98) is liable to be punished with penal servitude for any term not exceeding seven years and not less than three, or with imprisonment for a term not exceeding two years. And any official, whose business it is to furnish certified copies of documents, wilfully certifying a false copy is guilty of felony, and is liable to the punishment of penal servitude for three to seven years or of imprisonment for two years. See Statute 24 & 25 Vict. c. 98.

Falstaf, Fastolff, or **Falstolf, Sir John,** a famous English soldier, was born in Norfolk in 1377. He took a prominent part in the battle of Agincourt (1415) and in subsequent military matters in France. After the death of Henry V. he was appointed governor of Maine and Anjou and died in 1459.

Fal'ster, a Danish island in the Baltic, 2½ miles S. of Zealand, and included in the amt of Maribo. It is flat, low, and rather unhealthy, but yields much corn and timber, and is celebrated for its fruits. Nykjöbing, the capital (pop. 3645), is on the Guldborgsund, and has a cathedral, castle, and some trade. F. became a royal domain in the 16th c., and was the chief residence of several Danish queens, of whom the last was Charlotte Amalie, 1700-14. Area 182 sq. miles; pop. 32,656.

Fa'lun, or **Fah'lun** (otherwise *Gamla Kopparberget*, 'the old copper-mine'), the capital of the 'län' Kopparberg, Sweden, on the N. shore of Lake Runn, 120 miles N.W. of Stockholm by railway. It has long been famous for its copper-mines, which are now, however, much less profitable than of yore. The mines were formerly the most extensive of the kind in Sweden, and indeed in the world. About the middle of the 17th c. the yield was 3000 tons. The smoke from the neighbouring copper furnaces has given the town a dingy appearance. F. has also a mining-school and museum, cotton and flax mills, besides manufactures of cow-hair cloth, leather, tobacco, nails, &c. The fumes have destroyed the vegetation on the surrounding hills, yet the inhabitants do not appear to have suffered in their health. It is said that this adulteration of the atmosphere acted as a protection in these parts during the cholera visitations to Sweden. Pop. 7982.

Fa'ma (Lat.; Gr. *Phēmē*, or *Ossa*) was the personification of rumour or report. She is called by various ancient poets the messenger of Zeus, the daughter of Hope, and the daughter of Terra. According to Ovid her abode is composed of sounding brass and many passages lead thereto.

Famil'iar Spir'its is a name in which three different shades of meaning may be traced, or perhaps there have been three stages in the development of the idea expressed. 1. F. S. were originally the shades or ghosts of deceased persons brought up by magical arts from the abode of the dead, which, according to all ancient ideas, was in the bowels of the earth, in order that they might give information about future or doubtful things. This is necromancy pure and simple, and is well seen in the episode of the witch of Endor, to whom Saul said, 'Divine unto me by *a* familiar spirit, and bring me up whom I shall name unto thee' (1 Sam. xxviii. 8). The term familiar spirit has the same meaning in Isa. viii. 19, where the prophet asks, '[Why inquire] at the dead concerning the living?' The shade of Samuel appears to have been seen by the witch; generally, however, the F. S. appeared to speak out of the ground: *cf.* Isa. xxix. 4, 'Thy voice shall be as of a familiar spirit, out of the ground.' 2. Again F. S. were demons (in the original sense of disembodied spirits not necessarily evil) who took up their abode in the bodies of the magicians, who revealed matters communicated to them by the F. S. The persons so possessed were called by the Greeks *engastrimuthoi* ('ventriloquists'), doubtless because designing men often imposed on people by means of the faculty of ventriloquism, and made sounds appear to come from their belly or breast, as well as from the ground. Isa. viii. 19 ('those that chirp and whisper') alludes to their imitating the chirping of bats. It is the name given in the LXX. to those having F. S., distinguishing them, as in Deut. xviii. 11, from necromancers, although, on the other hand, the term is also applied to the witch of Endor (1 Sam. xxviii. 7). They were also called *Puthones*, which is the term used in Acts xvi. 16—'a spirit of Python.' 3. The third stage in the development of the idea was when demons came to be regarded by the Christian Church as altogether evil. Tertullian, in his *Apology for the Christians*, describes them as being 'everywhere in a single moment; the whole world is as one place to them; all that is done over the whole extent of it, it is as easy for them to know as to report. . . . The purposes of God, too, they took up of old from the lips of the prophets, even as they spoke them; and they gather them still from their works when they hear them read aloud. Thus getting, too, from this source some imitations of the future, they set themselves up as rivals of the true God, while they steal his divinations.' See DEMONS, NECROMANCY, and WITCHCRAFT.

Familiars. See INQUISITION.

Fam'ily. The word F. is derived from the Latin *familia*, and this from the Oscan *famal*, 'a servant,' or *faama*, 'a house.' This last corresponds to the Sanskrit *dhâman* (*cf.* Lat. *domus*), 'house,' from the radical *dhâ*, 'to place.' At Rome the primitive meaning of *familia* was the number of slaves or servants belonging to a person or a public office; then all those, whether masters or slaves, living under the same roof; lastly, all those connected by blood, whether living together or not. Its general meaning now is those persons connected by blood who live together, *i.e.*, father, mother, and children. But it has numerous other meanings. It is applied to the establishment of a cardinal, to the human race, to the children apart from the parents, to a political dynasty, to a religious order, to a group of organisms in botany or zoology, to a group of substances in chemistry, of allied words in philology, or of surfaces or curves in geometry having analytical or other properties in common. The legal conception of F., implying various reciprocal obligations and duties between parents and children, has been the subject of many theories. By one, the children became the property of the parents; by another, there was a tacit convention between parent and child; by a third, burdens were placed on the parents as a punishment for having sinned in bringing into existence creatures incapable of supporting themselves. Board, nourishment, education, are among the obvious positive obligations of parents; they, in turn, have a claim for support upon their children in case of old age and destitution. The limits and pecuniary amount of these obligations are of course varied by different municipal laws. The character of a nation, and the general laws which govern society, depend to a large extent on the kind of families of which society is composed. Originally, the domestic was a much more powerful and comprehensive form of association than it is now. In the primitive clan or tribe there are many features which suggest the F. relation. In Greece and Rome we find a close association of servants with the blood-relations. The inner life of the Roman F. deserves a few words. The powers of the head of a F. were three—*potestas*, *manus* and *mancipium*. The first was either *potestas dominica* over slaves, or *potestas patria* over children; these two were different. *Manus* or marital power placed the wife on the footing of *filiafamilias*. The father had a legal power of selling (*mancipare*) his children into bondage; a *mancipium* was a *filiusfamilias* sold as a bondsman to another *paterfamilias*, to whom he stood in the position of a slave, though otherwise a free citizen, the exercise of political functions being probably suspended. The original power of the father was indeed that of life and death. But this disappeared long before Hadrian and Constantine (A.D. 319) included killing by a father under the crime of parricide. Trajan compelled a father to emancipate a son he had treated with inhumanity. The primitive option of a parent to nurture or to expose was also taken away, and is formally prohibited by a law of Valentinian (A.D. 374). In the same way a law of Diocletian and Maximian declares the sale, donation, and pledging of children to be unlawful. The surrender of a child to satisfy a claim of damages based on the child's wrong-doing lingered in the law, but even this was prohibited by Justinian. Yet in extreme poverty parents might sell children at birth-time (*sanguinolenti*). In polygamous countries a different set of conditions is presented, in which the influence of father and mother is entirely separate; while in Transylvania, Servia, and other Slavic countries in the S.E. of Europe, households of fifty and sixty are still found presided over by the house-father.

Family, a division of the animal and plant world used in classification. The F. is a group which embraces a number of more or less nearly-allied genera (see GENUS). Thus, the

F. *Felidæ* (q.v.), forming one of the subdivisions of the great Carnivorous order of *Mammalia*, includes the principal genus *Felis* and allied genera, represented by such nearly-related animals as the lions, tigers, cats, lynxes, &c. The F. in turn forms one of the subdivisions of the higher 'order.' In some cases, where the animals to be classified are not numerous, the F. may be omitted altogether, the genera in such a case being directly included in the Order (q.v.).

Family of Love, a religious sect founded about the middle of the 16th c. by Henry Nicholas, a Münster Anabaptist, who, after making several converts in Holland, crossed to England, where his doctrines won considerable favour among the ignorant. He held himself to be greater than Moses or Christ, for while Moses preached hope, and Christ faith, he preached love. He made religion identical with love, independent of dogma; through love men could be absorbed in God, and even things forbidden were enjoyable by the pure. These teachings resulted in coarse license, and in 1580 Queen Elizabeth caused the sect to be scattered and their books burned. In 1604 they sought permission from James I. to answer the attacks made on them, and tried to ingratiate themselves with the king by slandering the Puritans, but their request was refused, and the sect gradually died out through the frequent exposure of their practices. See Roger's *Displaying of an Horrible Secte of Grosse and Wicked Heretiques naming themselves the F. of L.* (Lond. 1579); Mosheim's *Ecclesiastical History*, ch. xvi.; and Collier's *Ecclesiastical History of England*.

Fan ('that which *blows*'; Old Eng. *fann*; *cf.* Ger. *wanne*, Fr. *van*, from Lat. *vannus*; the Fr. *éventail* is from *éventer*, 'to raise a wind'), an ornamental object used principally by ladies to cool their faces by agitating the air. The modern European F. usually consists of a decorated mount attached to a stick, composed of two master-pieces and slender radiating ribs, in such a manner that the fan may be folded or spread out at pleasure. The mount may be formed either of silk, paper, vellum, lace, or other thin and light material; and the stick, of ivory, bone, mother-of-pearl, wood, tortoiseshell, &c. The F. had its origin in the East, and among the civilised nations of antiquity it was regarded as an emblem of majesty and power. Rigid feather-plume fans with long handles were used by both sexes among the Greeks and Romans; and from the painted pottery preserved from remote ages we know that the opulent had servants to wave fans over them, as is customary in Oriental countries at the present time. The accompanying representation of Cupid fanning his mother is taken from an ancient piece of sculpture. The F. in one form or other is now common to all countries. Prior to the 15th c. the folding F. was unknown in Europe; but even then it had long been in use among the Japanese and Chinese, the latter people having adopted it from their more skilful and ingenious neighbours. From China it was brought to Europe by the Portuguese; and in the 16th c. it was common to Portugal, Spain, Italy, and France. In the time of Henry VIII. English ladies generally carried a feather F. suspended to the girdle, and till after the period of the Restoration folding fans were scarcely known in England. Some early English fans were provided with very long handles, so long, indeed, that ladies walked with them. They seem to have served to chastise the unruly and disobedient. In Beaumont and Fletcher's *Wit at Several Weapons*, occurs

> 'Wer't not better
> Your head were broken with the handle of a fan?

and in 1 *Henry IV.* ii. 3, Hotspur says, 'I could brain him with his lady's fan.' One of the most exquisitely humorous of Addison's papers in the *Spectator* deals with the manipulation of the F. The Chinese fabricate cheap folding fans with palm-leaf or with painted silk or paper mounts for export. Fans of inferior quality are made at Vienna, London, and in parts of France and Belgium. In Spain a F. may be bought for a farthing; at a bull-fight exhibition every person buys one. Paris has no rival in the production of the highly artistic F. The *éventailliste*, or F.-maker, commands the services of eminent artists for designs, and only employs the most skilful workmen to carry them into effect. F.-making attained great excellence in the reign of Louis XIV., and many of the fans then produced were so costly that they were simply expanded for ostentation and not for utility. Fans belonging to the epoch of *le Grande Monarque* are much prized and eagerly sought after for private collections. The language of the F., in which most ladies of last century were deeply read, has now almost died out. In Spanish-speaking countries, however, the F. is still an instrument of diplomacy and intrigue, and by it a coquette can convey to her admirer her train of thought.

Fan.

A special form of instrument for producing currents of air, used in certain industrial operations, is designated a F. See Fanners.

Fanar'iots or **Phanariotes,** a name given at first to the inhabitants of the Fanar or Greek quarter of Constantinople, so called from its beacon (Gr. *phanarion*). These Greeks, after the capture of Constantinople by the Turks, made themselves, by their adroitness and business talents, very useful as secretaries to Turkish ministers and dignitaries. Towards the close of the 17th c. all the dragomans were chosen solely from their ranks, and this greatly swelling their influence, they induced the Porte to choose the hospodars or governors of Wallachia and Moldavia from them exclusively. These hospodars were followed to their provinces by hosts of F., who held various offices, and wrung wealth from the provincials by the most unprincipled rapacity. The F. no longer exist as a distinct class. See Finlay's *History of the Greek Revolution*.

Fandan'go, a lively Spanish national dance, in triple time, executed to the accompaniment of the guitar, the dancers beating time with castanets. It is most popular in the country, especially so in Andalusia. Several attempts have been made by the Church to suppress the custom, and all in vain, for the dance maintains its place as a chief amusement among the villagers as much as amongst the townspeople.

Fan'euil Hall, in Boston, Massachusetts, consisting of a market-house below with a town-hall and other rooms above, was built and given to the town by Peter Faneuil in 1742. It was frequently used for public assemblies during the War of Independence, and was hence known as 'the cradle of liberty.' It is still used as a public hall, and has several good paintings. It was destroyed by fire in 1761, and in 1763 was rebuilt by the town, and has since then been enlarged.

Fan'fare, a French term denoting a flourish of trumpets or other brass instruments. The music is of Moorish origin, and passed from Spain to France and other countries, including those of the New World. A derivative from F. is *fanfaron*, meaning a braggart, probably from the noise he makes, while his braggadocia is called *fanfaronnade*.

Fanfish, or **Sailfish,** the name given to a species of Teleostean fishes belonging to the family *Xiphiidæ* or swordfishes. The name is derived from the great height and size of the dorsal fin, which the fish appears to raise or depress at will. The ventral fins are very small, and the tail is deeply forked, its lobes being of equal size. The F. inhabits tropical seas, and is common round the coasts of Ceylon.

Fang (Old Eng. *fang*, 'that which *takes* or *seizes*,' from *fon*, a contraction of *fangan*, 'to seize;' *cf.* Ger. *fangen*, Dutch, *vangen*, Dan. *fange*). A thief captured while carrying stolen goods is, in Scottish legal phraseology, 'taken with the F.' As a noun it still survives in standard English, as in the 'fang' of a wild beast; while in Scotland people still speak of a well having lost its 'fang.' It was used as a verb by the Elizabethans; thus Webster says, 'He's in the law's clutches; you see he's *fanged*.'

Fann'ers, a deriv. from Fan (q.v.), a form of blowing apparatus used in agriculture for winnowing the chaff from the grain of corn. It consists essentially of a revolving fan with four or five arms or vanes, mounted within a box or case. The fan draws in air through openings at the side of the case, and throwing it forcibly forward against the mixed grain and chaff fed into the apparatus, drives the light chaff out at an opening at the opposite end of the case, the grain falling down and being delivered by spouts at the sides. The heavier and plumper grains fall nearest the fan, while lighter grains are carried further on, and may be delivered by a separate spout. It is thus possible to separate the grain fed into the hopper into three or four qualities, besides freeing it from the chaff. F. constitutes an essential part of a threshing-machine, and farmers usually are supplied with a separate barn-F. The finishing F., or duster, is a simpler apparatus used for re-winnowing grain, or, as its name indicates, for dusting or cleaning grain which may have lain any time in the granary. The F. was invented by Andrew Cavers, a farmer in Roxburghshire, in the early part of the 18th c. The principle of the F. is adopted in many important metallurgical operations for creating a powerful blast of air and to ventilate mines, stoke-holes of steamers, &c.

Fanning Island, an island of coral formation in the Pacific Ocean, 3° 50′ N. lat. and 159° W. long., which bears a good supply of coco-nut trees. It was annexed by the British Government in 1892. Sea fowl and turtle abound.

Fa'no, an Italian watering-place in the province of Urbino e Pesaro, 30 miles N.W. of Ancona by railway. It stands a mile N. of the mouth of the Metauro, in a fertile plain, and is well built and girt with walls. It has a cathedral and several fine churches, in which there are many grand paintings, frescoes, and marbles, among others Guido's 'Annunciation,' and several works by Guercino and Domenichino. The principal manufacture is of silk. The commerce has greatly declined, and the port has been largely silted up. The chief classic relic is an arch of white marble raised in honour of Augustus. F. is the anc. *Fanum Fortunæ*, so called from the temple to Fortune built here by the Romans after the battle of the Metaurus. Pop. 22,008.

Fan-Palm, a popular name (suggested by the form of the leaves or fronds) given to various species of Palms (q.v.) belonging to the genera *Mauritia*, *Hyphæna*, *Livistonia*, &c. The F.-P. of Europe and the palmetto of N. America are examples.

Fan'shawe, Sir Richard, a diplomatist and poet, was born at Ware Park, Hertfordshire, in 1608. He studied at Cambridge, entered the Inner Temple, and was sent to Madrid by Charles I. in 1635 as secretary to the embassy. F. espoused the royal cause in the civil war, was taken prisoner at Worcester (1651), and on being freed, joined Charles II. at Breda. He was sent after the Restoration as ambassador to Lisbon, where he negotiated the marriage of Charles II. with the princess Catharine, and to Madrid, where he died, 16th June, 1666. F. translated Guarini's *Pastor Fido* (1647), Camoens' *Lusiad* (1655), Horace's *Odes*, and the fourth book of the *Æneid*. He wrote also original verse, *A Short Discourse on the Long Wars of Rome*, and a Latin version of Fletcher's *Faithful Shepherdess*. He was an elegant and spirited translator. His letters were published in 1701.

Fans, The, a race on the equatorial coast of W. Africa, chiefly on the Gabeon or Gabun river, of a copper-brown colour and slight build. They had revolting cannibal practices, and are said to have bartered their dead with each other. They wore dresses of bark, stained themselves with red wood, and held wild orgies at every full moon. Their traditions assert that they came from the N.E., and they seem to be the 'Yagas' of the old Portuguese writers. Since the French have taken possession of the country the habits and customs of the people have greatly changed, and at the present day the Fans are in no way worse than any of their neighbours either in respect of a tendency to cannibalism, or any other abomination, which is soon suppressed on the approach of the European.

Fan'tail, the name given to several species of Insessorial birds belonging to the section *Dentirostres* of that order, and to the family of the *Muscicapidæ* or fly-catchers. Certain varieties of Pigeons (q.v.) are so called from the spreading nature of the tail-feathers. The white-shafted fantail of Australia is a well-known species. The bill in this genus has long basal bristles, the nostrils being partly hidden by plumes; the first wing-quills are short, the fourth and fifth being longest. The tail is broad, and the tarsi are broadly scaled. The colour of the species just mentioned is a dusky olive-black on the upper parts, a white streak existing above and below the eye. The throat, edges of the wing-coverts, tips and shafts of the tail-feathers (excepting the two middle feathers) are white; and the tail-feathers when expanded form a fan-like structure. The average length of the bird is about five inches.

Fanta'sia, in music a composition in free form, like the Capriccio (q.v.). In modern music the F. is often an enlargement and embellishment of some popular air; or of melodies from an opera, arranged for performance as an instrumental solo.

Fan'ti or **Fantee,** a country of W. Africa, on the Guinea coast, lies between the rivers Sakuru on the E., and Kaku on the W., and is separated from Ashanti on the N. by dense forests. It is a rich strip of coast-land, yielding much gold-dust, and supporting a numerous people. The Fantis are closely allied in race to the Ashantis, who conquered them and greatly destroyed their country in 1807. See Brackenbury and Wilson, *Fanti and Ashanti*.

Fan-Tracery, a beautiful form of vaulting, invented by English architects in the 15th c. It is used in Late Perpendicular work, and is found only in England. The ribs which compose it spring from the capitals of the shafts with a uniform outward curve, and the spaces between these diverging ribs are filled by a rich tracery of foils and cusps. Fine examples of F.-T. are to be seen at Peterborough; King's College, Cambridge; Ely; St. George's Chapel, Windsor; Henry VII.'s Chapel at Westminster; and in the cloisters at Gloucester. F.-T. was often used over tombs, in cloisters, chantry chapels, and other small buildings.

Far'aday, Michael, D.C.L., F.R.S., an illustrious English physicist, was born near London, 22nd September, 1791. The son of poor parents, he received the most elementary education, and was apprenticed in 1805 to a bookbinder. Here he used well his opportunities for acquiring knowledge; and his reading, together with evening lectures by Tatum, which he sometimes attended, gave his mind a strong bent towards physical and especially electrical subjects. While working as a journeyman bookbinder he obtained the patronage of Sir Humphry Davy, and became his assistant at the Royal Institution in 1813. He subsequently travelled with Davy on the Continent, and soon after his return, in 1815, made his first published contribution to science, an analysis of some caustic lime from Tuscany. In 1820 his attention was directed to Œrsted's discovery of the action of a current upon a magnet, and his *History of the Progress of Electro-Magnetism* (1821) prepared him for his later celebrated researches in this and allied branches of physics. In 1823 he liquefied chlorine, and in 1824 was elected a Fellow of the Royal Society. Of his chemical papers which appeared in the *Philosophical Transactions* about this time, that relating to the discovery of benzol deserves special notice. He succeeded Davy as lecturer at the Royal Institution in 1827, and was appointed Professor of Chemistry there in 1833. In 1831 he had returned to his electrical researches, and made his great discovery of magneto-electric induction—the generation of electric currents in conductors moving relatively to a magnet or other current. This led to a series of investigations to establish the 'identity of electricities,' and later, in 1833, to the hitherto but little understood subject of electrolysis, his papers on which evince at once his high experimental skill and his profound mental acumen. From 1836 to 1838 frictional electricity engaged his attention, the outcome of his researches being the discovery of the specific inductive capacity of insulators or *dielectrics*, a discovery of the highest importance in submarine telegraphy.

In 1841 he established the 'magnetisation of light,' or the rotation which a plane polarized ray of light undergoes in a magnetic field. Then followed his researches in diamagnetism, and his investigations on the magnetism of gases and atmospheric magnetism. In 1835, at the suggestion of Lord Melbourne, he received from Government a pension of £500, and in 1858 the Queen allotted him a residence in Hampton Court, where he died, 25th August, 1867. F. was a man of simple and unaffected tastes, of open and unassuming character, and of deep personal piety. In physical science he is unquestionably the greatest experimentalist that England, perhaps the world, has ever seen. His principal works are *Experimental Researches on Electricity*, *Lectures on Various Forces of Matter*, and *Lectures on the Chemical History of a Candle.* See *Life of F.* by Tyndall (1869), and by Bence Jones (1870).

Farai'zi, a name derived from the Arabic *farz*, 'a command,' and applied in India, and especially in Bengal, to the reformed sect of Mohammedans who resemble the Wahabis of Arabia and as *followers of the divine ordinances of God*, although Sunnis, they reject *tradition*, and hold the Koran to be the full and complete guide to spiritual life. About the year 1827, a pilgrim from Mecca, on returning to his native village in the district of Furreedpore (Faridpur), near Dacca, taught the new faith to his neighbours. It is supposed that the majority of the Mussulmans in Eastern Bengal, who there outnumber the Hindus, now belong to the F. sect. In 1831 the propagandism gave rise to serious riots, and again in 1870 the villagers of the Gangetic delta were found to be carrying on intrigues with the armed rebels on the frontier of the Punjab; but at the present time there is no reason to doubt the loyalty of this portion of the Indian community. Most of the F. are agriculturists and are morally strict, earnestly religious, and careful to promote the welfare of the sect. But they are very bigoted and take so little pains to conceal their contempt for persons of other religious opinions, that their behaviour is ever a source of disquietude which sometimes culminates in regular outbreaks between them and the persons whom they offend; in fact they occupy very much the same position in this respect on the E. of India as the Moplahs do on the W.

Farce (from the Ital. *farsa*, Lat. *farcire*, 'to stuff,' or from the Provençal *farsum*, 'a ragout or mixture,' like the Lat. *satura*), a form of the drama which seeks to provoke mirth by dialogue and incident more ludicrous and less natural and refined than is admissible in comedy. The Greek *satyric plays* were essentially farces. *Saturæ*, or farces combining conversation with music and dancing, and *fabulæ Atellanæ*, or farces of Campanian origin, were the most popular of the Roman dramatic entertainments, and, even under the Cæsars, gave publicity to political feeling in their ribald, vigorous dialogue. In the Middle Ages, *jeux*, or profane dramatic performances, were common, and from these arose the farces of the *clercs de la Basoche*—a society founded in Paris in 1303. (See BASOCHES.) These early French farces were short, seldom exceeding 500 lines, mostly indecent, and without the stinging wit of the *fabliaux*. Coarse and frequently impromptu farces prevailed on the French stage until Molière founded genuine French comedy. In Italy the term *farsa* was applied to comic plays, which seem to have been modified from the ancient *fabulæ*, and which were greatly developed at the end of the 14th c. by Sannagarro. In mediæval Germany *farce* denoted a song chanted during divine service. In England farces appear distinct from comedy about the beginning of the 18th c. Perhaps the most notable name in English farcical literature is that of Samuel Foote (q.v.).

Far'cy, a disease of horses, closely associated with Glanders (q.v.), and distinguished by the inflammation and swelling of the lymphatic or absorbent vessels of either or both hind-limbs. The inflammatory process extends to the formation of ulcers, and of swellings known as 'F.-buds.' The treatment for the local affection is cauterization with the hot iron; but constitutional remedies—such as the internal administration of copper and iodine—with good feeding and dry bedding, are also demanded. The poison producing these diseases is capable of being transmitted from the horse to the human subject, from one human being to another, and also to the horse and ass. It may be absorbed both by the cutaneous and mucous tissues, and thus infect the blood. The attention of the profession was first called to this disease in man by Muscroft in the *Edinburgh Medical and Surgical Journal* (1821).

Fardel-Bound, an old veterinary term for obstruction of the third stomach—the 'manyplies'—of cattle, generally caused by tough or indigestible food, such as leaves, moist clover, or grass, and the like. The results of this affection are inflammation of the stomach, together with paralysis from its distension. The skin is hot, and feverish symptoms also prevail, whilst rumination is necessarily interfered with. The remedies to be adopted for the relief of this complaint consist in free purgation and injections; probably the latter are safest in the generality of cases. The food must be light, and consist chiefly of soft mashes. The stimulants needed in severe cases may consist of ale with ginger.

Fare'ham ('the dwelling at the ferry'), a market-town of the county of Southampton or Hampshire, England, on F. Creek, at the N.W. angle of Portsmouth Harbour, 5 miles N.N.W. of Spithead by railway, with manufactures of bricks, leather, shirt-collars, whiting, tobacco-pipes and pottery. Vessels of good tonnage come close to F., which has an active trade. Vessels of small burthen are built here. Pop. parl. div. of county 66,014; reg. sub-dist. 12,222; and civ. par. 7934.

Far'el, Guillaume, 'the pioneer of the Reformation in Switzerland and France,' was born at the hamlet of Farels, near Gap, Dauphiny, in 1489. His parents, who were Romanist, destined him for the army; but in 1500 he betook himself to Paris University, where he became a devoted disciple of Lefèvre d'Étaples, and gained a chair in the college of Cardinal de la Moine. Lefèvre's advanced views calling down the wrath of the Sorbonne, he and F. had to quit Paris for Meaux, then a stronghold of Lutheranism, where F. began to denounce the Catholic Church. In 1524 F. sustained at Basel thirteen theses on the chief points of controversy between the Catholics and Reformers, and about this time won the friendship of Haller and Zwingli. Thenceforth he gave himself up to the conversion of Switzerland, making the canton Bern the centre of his missionary labours, preaching with tireless and fervid zeal, and running great dangers from his rash and uncompromising iconoclasm. After the issuing of the Edict of the Reformation by the municipality of Geneva in 1535, F. laboured along with Calvin to organize there the new Protestant Church, a difficult task from the excesses of the *Libertins*, or Reformers, who refused to obey any authorities in matters of religion. After allaying (1542) the disorders rife among the Protestants of Neufchâtel, and preaching at Metz, Montigny, and Gorge—where he was nearly killed in a skirmish—F. was sent in 1557 with Beza to seek the intervention of the German Reformed princes in behalf of the Vaudois, and after his return to Switzerland married a young girl, much to Calvin's displeasure. In 1561 he was imprisoned at Gap, but escaped by a basket lowered from the ramparts. Shortly after making a last visit to Calvin, who was then dying, F. ended his days at Neufchâtel, 13th September, 1565. F. was not a systematic theologian, nor even a judicious ecclesiastic, but he was an admirable preacher, fluent, impressive, ardent, and as a missionary was the chief agent in the conversion of Switzerland. Among his numerous works, which, however, give no idea of his mastery of language, are *Themata Quædam Latine et Germanice Proposita* (1528), *De Oratione Dominica* (1524), and many epistles and treatises, many of which are inserted in Ruchat's *Hist. de la Réforme en Suisse.*

Farewell, Cape, the southern extremity of Greenland, is dangerous to navigators from the masses of ice in its neighbourhood, which are constantly being forced by currents setting in from the N.E. round into Davis Straits. Trading vessels, as a rule, set their course at least 100 miles distant from this part of the coast.

Fari'a Y Sousa or **Souza, Manoel,** a Portuguese critic, poet, and historian, was born 18th March, 1590. His father's name was Amador Perez de Erro, but when, after a successful university career, he entered upon diplomatic life, he took the name of his mother. From 1631 till within a few years of his death, which took place 3rd June, 1649, he held the post of secretary to the Spanish embassy at Rome. F. is best known for his poems, consisting chiefly of eclogues, madrigals, and sonnets, written both in Portuguese and in Spanish; his treatises on poetry, which caused Lope de Vega to style him the first critic of the age, and of which his great commentary on the *Lusiad* (Mad. 1639) is the best; and his historical works, treating of Portugal and its dependencies. His *Imperio de China*, edited by Father Semmedo, and translated into French and Italian, is still recognised as one of the best of the elder authorities on the subject.—**Manoel Severim de F.,** a Portuguese historian and antiquary, born at Lisbon 1581, died at Evora, 16th September, 1655. He wrote *Noticias de Portugal* (Evor. 1624; 3rd ed. Lisb. 1791), and was reckoned one of the best numismatists of his age.

Fari'na, a name frequently applied to the flour or the starch of cereals or of other starchy plants, such as the cassava, arrowroot, &c. It is derived from the Latin *far*, meaning spelt wheat. In commercial circles the term F. is restricted to the starch obtained from potatoes, which is very extensively consumed as an adulterant of the more expensive starches, such as arrowroot, tapioca, &c., and of butter and other articles of food. It is also prepared as an article of food under the name of French sago, and it is largely employed as the basis of starch sugar, which, under the name of saccharine, is much used by brewers. Its chief consumption, however, is as a thickener in calico-printing, for which it is also prepared by torrefaction as dextrin or British gum. Fossil F. is an infusorial earth, the *berg-mehl* of the Swedes and Laplanders.

Farina Trit'ici, the grain of wheat, *Triticum vulgare*, ground and sifted, is used in medicine for the preparation of *Cataplasma fermenti*. When made into a paste with honey, it forms an excellent application for boils.

Farinelli, Carlo, whose proper name was Carlo Broschi, was born at Naples, in 1705, and became a celebrated Italian soprano singer. He visited London in 1734-35 and achieved a great success. Two years later he was invited by the Queen to the Court at Madrid, in the hope of dissipating the nervous condition of health of Philip V. In this he was entirely successful, and became a great favourite of the king, to whom he acted as attendant, and in that capacity obtained great influence, which he continued to hold during the following reign of Ferdinand VI. He appears to have been a most benevolent and upright man. In 1759, soon after the accession of Charles III., he fell into disgrace and was compelled to leave Spain. He retired to Bologna, where he died in 1782.

Faringdon, a well-built clean little town in Berkshire, within the Vale of the White Horse, about 36 miles to the N.W. of Reading. It dates back to the time of the Saxon Kings, and in 925 Eadward the Elder died here. There was a castle here, the site of which was made over by King John to the Cistercian brotherhood. The parish church of All Saints, which has been within recent years restored, is a fine example of Gothic architecture, and contains some ancient monuments. Bacon and corn are the chief products of the surrounding district. During the Civil War Faringdon House was besieged, and its defenders offered a stout resistance. Pop. reg. sub-dist. 5703; and ecc. par. 2988.

Fari'ni, Car'lo Lui'gi, an Italian politician and author, was born at Russi in the Romagna, 22nd October, 1822. He studied medicine at Bologna, and became known as a writer of scientific treatises, but being connected with the Liberal movement of 1841-43, had to quit the Papal territory, and resided successively at Marseille, Paris, Florence, and Turin. On Pius IX. granting an amnesty, F. established himself as a physician at Osimo, but shortly afterwards, entering on a political career, became under-secretary of state, and was sent in 1848 on a confidential mission to the camp of Carlo Alberto. He held aloof from the Roman Republic of 1849, and his services being rejected by the Church party after the French occupied Rome, he betook himself to Piedmont, where his moderate but liberal views secured him the royal favour. He was made minister of public education, knighted, elected to the Piedmontese National Assembly, and in 1859 named dictator of the duchy of Modena. He rendered important services in uniting central Italy to Piedmont, was appointed minister of state and royal secretary, refused in 1862 to join the Ratazzi ministry, became president of the cabinet, retired in 1863, and died at Genoa, 1st August, 1866. He wrote *Storia dello Stato Romano dal Anno* 1814 *al* 1850, a valuable historic work, which has gone through several editions; *Storia d'Italia*, a continuation of Botta's history of Italy; and letters to Gladstone, &c. F. was one of the most sagacious of Italian statesmen, and Italy is greatly indebted to him for her present stable government.

Farm (Old Eng. *feorm* and *feorme*, originally 'food;' next, the 'rent' (paid in kind) of land; finally, the 'rented land' itself), a portion of land or tract of country occupied as one undertaking for the cultivation of crops, or for the rearing and maintaining of cattle, sheep, and other creatures useful to man. Farming, viewed in its widest sense, is the greatest, as it is the primal and fundamental, industry of the human race. On its operations, to a great extent, depend not only the feeding, but the clothing of mankind, and most of the plants which are cultivated, and of the animals said to be domesticated, are so as a result of farming operations. Taking a narrower and technical view of farming, it embraces only those lands on which cereal, pasture, and green crops are cultivated, and sheep and cattle reared. Gardening and the cultivation of many products of human industry are embraced under other heads.

In Great Britain farms are classed under two heads—(1) arable farms, and (2) natural pasture and hill farms. Arable farms again are subdivided into (1) ordinary arable or grain-producing farms, (2) stock farms, and (3) dairy farms. These subdivisions are not sharply distinguished from each other, and they merely indicate the prevailing feature in the agricultural industry of any special locality or F., such features being generally controlled by circumstances of soil, situation, and climate. Thus on a F. in the great wheat-producing districts, a certain proportion of stock is fattened, and dairy produce is prepared, although its staple may be grain. The stock F. is principally devoted to the rearing and fattening of cattle for the fat market, and crops and field operations are all directed with a view to that chief object. In the case of a dairy F. the ultimate object of the farmer is the obtaining of milk for sale or for the manufacture of butter and cheese, and stock is selected and crops grown suitably for such objects. Natural pastures and uncultivated hill land are extensively laid out as sheep farms or sheep walks; and a F. of this description usually embraces a great area.

The size of farms is entirely regulated by convenience; but there is an increasing tendency to form farms of great extent. The scientific development of agricultural operations, and the introduction of expensive, yet economical, labour-saving appliances, render it necessary for a first-class F. to be one of considerable size, that it may yield a sufficient return for the capital sunk in appliances connected with its working. A great revolution in rural affairs has therefore taken place within recent times; the cottier and small farmer have declined, and small holdings have been combined to form large farms, which must be worked by persons having command of considerable capital. The modern farmer must also be possessed of a wide range of scientific and practical knowledge, of considerable mechanical skill, and much business aptitude. In England, Scotland, and Wales, of 32,629,855 acres returned in 1894 as being under cultivation, 4,643,000 are stated to be farmed by owners, as against 4,672,000 farmed by owners in 1893 out of 32,643,709 returned as cultivated. Concerning the laws which regulate the occupancy of land, see LAND LAWS, LANDLORD AND TENANT, and HYPOTHEC.

Farm Buildings. The various offices and structures required for the working of a farm are collectively known in England as the homestead, and in Scotland they are called the steading. The accommodation necessary varies in size and arrangement, according to the extent of the farm it serves, and the nature of the chief products cultivated. Thus on a dairy farm the cow byre and dairy offices are the chief features, and on a stock farm prominence must be given to the feeding byres and arrangements for preparing food. As the health of his live-stock is an object of supreme importance to the farmer, F. B. ought to be placed in situations securing, as far as possible, abundant water supply, good drainage, freedom from damp, and a sheltered yet airy situation. The arrangement of F. B. is a matter of much practical importance, and the various parts should be so compacted that operations dependent on each other, or following in consecutive order, should be performed in immediate proximity; and the saving of all unnecessary labour, as well as the prompt and rapid execution of work, ought always to be kept prominently in view. The position of the threshing mill and barn will generally be found to be the key to the arrangement of the whole range of F. B., as many of the most laborious duties of a farm, such as the feeding and littering of the live-stock are intimately connected with that department. It is usually found that F. B. of moderate extent come together most conveniently in the form of three sides of a square or parallelogram. The space lying between the projecting sides is either roofed over or left as an open court, and used as a yard for young cattle during the winter (if unroofed, with a covered shed attached), and as a repository for the manure from the stables and byres at its side. The ordinary F. B. comprise a threshing-mill, granary and straw-barn, stables, stock and dairy byres, court and covered sheds for young cattle, calves' house, piggery, poultry house, sheds for storing turnips, boiler and food-preparing house, implement house, and cart-shed. The dairy is usually attached to the farmhouse, at once as a matter of convenience, and because that department must, as far as possible, be removed from all noxious smells. The farmer's house and labourers' cottages also form an essential part of F. B., but the arrangement and size of these are regulated by the principles of ordinary domestic architecture.

Farm Servants. See WAGES.

Far'mer, Richard, D.D., an English scholar and archæologist, was born at Leicester, 28th August, 1735. Educated at Emmanuel College, Cambridge, where he graduated in 1760, he was first appointed curate of Swavesey, near Cambridge, became Master of Emmanuel in 1775, and librarian to the university, and was successively canon of Lichfield, Canterbury, and St. Paul's. He died 8th September, 1797. The following year his library, especially rich in works of Old English literature, was sold for £2210. F. collected copious materials for the history of Leicester, which he put into the hands of his friend Nichols. His sole work is his *Essay on the Learning of Shakespeare* (1776), reprinted by Steevens (1793), by Reed (1803), and by Harris (1812). In this he showed that Shakespeare's knowledge of the ancients was obtained from translations.

Farmers-General (Fr. *fermiers-généraux*) were persons who, under the *ancien régime* in France, obtained, for a fixed money payment, the right to collect one or more of the public taxes. This was the most expensive and least productive system of collection. Such rights, originally given to court favourites, were first exposed to public auction by Sully. After Colbert had detected the frauds of the individual collectors, a company or *ferme-générale* was formed in 1728, which, interrupted for a short time under the administration of Silhouette in 1759, continued in business till Necker's time, when it consisted of forty-four persons paying a rent of 186 millions of livres, and making an estimated profit of only two millions. The multiform and arbitrary nature of French taxation, and the quasi-official and yet practically irresponsible position of the F.-G. and their agents, led to great oppression. The French 'imposts' consisted in the first place of the '*taille roturière*,' at first a purely feudal contribution, but which the king, pressed by the expense of a standing army, gradually extended to the domains of his nobles. From 1,500,000 livres, in 1445, it rose under Henri IV. to fourteen millions, under Louis XIV. to thirty-five millions, under Louis XVI. to ninety-one millions. The *taillon* and the *crue* were additions to the *taille*. In 1710 Louis XIV. imposed a *dixième* on the revenues of the lands of nobles and churchmen, as well as of *roturiers*. Another *vingtième* was added for the war of American independence. In 1695 appeared the *capitation*, which affected the *roturier* class, the nobles, and public officers unequally, but from which the clergy were exempt. The *dîme*, estimated by Necker at 133 millions, went to the Church, but relieved the state of obligations towards the Church. Every five years the Church gave the king the *don gratuit*, about 3,600,000 livres. The *corvée* was a tax of eight days' labour, with cart and horse, on the public roads; its value was twenty millions. *Maîtrise* and *jurande* were taxes upon trade corporations and professions, which in 1788 produced 4,500,000 livres; and *vingtième d'industrie et de commerce* was a special tax on manufactured products and merchandise. The latter, along with all products whatever, were subject to the indirect tax or *aides*, which included *droits de sortie* or *traite foraine;* the tax on the extraction and sale of salt, which from 1345 was called *gabelle;* and certain dues on the sale of food, and the entry of wine into towns. As Charles VII. had dispensed with the consent of the States-General in imposing the *taille*, so François I. dispensed with their consent to the *aides* and *gabelle*. Certain of the *aides*, amounting in value to fifty-nine millions, were collected by the *régie générale des aides*, and were called *droits réunis*. The *ferme-générale* extended to the *gabelle*, which alone amounted to seventy-four millions, of which fifty-four reached the treasury; the monopoly introduced by Colbert for tobacco; the *droit d'entrée* on imported goods, originally one-thirtieth, imposed in 1581; the customs proper, internal and external. There was a third system of succession duties and feudal exactions, which were collected by the *régie des domaines*. The eighty *pays d'élection* formed twenty-four *généralités* for the purposes of collection, the gross amount being divided among the *généralités* by a *brevet-général*, but the further division among towns and parishes was at the pleasure of the *intendant*, and among different lands and persons by no fixed system of valuation. The *pays d'états* (such as Languedoc, Provence, Burgundy, Artois) had a much juster system, worked by *livres cadastrals*, or valued rent, and called *affouagement* (or 'hearth-tax'). In the *pays d'élection*, also, Necker's system of collection was to give three or five or six '*deniers pour livre*' to the various grades of officers, while the *pays d'état* put the collections up to auction in each province. The former were also called *pays de grande gabelle*, from the rate of salt-tax they paid; the latter, *petite gabelle*, or *franches* or *redimés*. The authorities on this important subject are Necker's *Administration des Finances*, Clamagéran's *Histoire de l'Impôt*, Laferièrre's *Histoire du Droit Français*.

Farne or **Ferne Isles**, or the **Staples**, a group of small islands from 2 to 5 miles off the coast of Northumberland, and S.E. of Lindisfarne. Several are merely rocks hidden at high water. On one is a priory named after St. Cuthbert (q.v.), who spent the last two years of his life here. They render navigation very dangerous. There are two beacons 30 feet high on two of the islets. Here Grace Darling (q.v.) effected the heroic rescue of nine people from the wreck of the *Forfarshire* in 1838. Pop. 15.

Farne'se, the name of a noble Roman family, dating from the 13th c., but first made important by **Alessandro F.**, who in 1534 became Pope Paul III.—His natural son, **Pietro Luigi**, who figures in the Life of Benvenuto Cellini, was about the worst man of his time. He got from his father the duchy of Castro as a fief of the Holy See, and Novara, an imperial fief, and the dukedom of Parma and Piacenza, subject to a payment of 8000 ducats to the pope. This division of papal property among popes' children was often practised. The new *gonfaloniere*, after a life of vice and tyranny, was murdered 10th September, 1547, by

Gonzaga, the governor of Milan, and others. His son, **Ottavio** (born in 1520), recovered from Philip II. possession of Piacenza, which had been occupied by Milanese troops. His friendship for Henri II. of France was suspected by the emperor and the pope, and he owed much of his security to his wife Margaret, governor of the Low Countries, the natural daughter of Charles V. He died in 1587.—**Alessandro,** son of Ottavio, known as *the* Duke of Parma, became one of the great captains of the age. He was with Don John of Austria at Lepanto (1571), and in 1578 defeated the Flemish 'Beggars' at Gembloux. Wonderful stories are told of his *sang-froid*, or rather love of danger, at the sieges in the Low Countries—Oudenarde, Antwerp, &c. As governor of the Spanish Netherlands he fought long and bitterly with the Prince of Orange. Philip II. gave him the command of the force gathered at Dunkirk for the invasion of England in 1588, and in 1590 sent him to the relief of Paris, besieged by Henri of Navarre. Ill supported by the Catholic League, he was forced to yield to the superior force of the Huguenot prince, and died 3rd December, 1592, at Arras, of a wound received before Rouen.—His son, **Ranuzio I.** (born 1569, died 1622), lived on the worst terms with the other Italian princes, especially Gonzaga of Mantua. He built the beautiful theatre of Parma.—His son, **Odoardo** (born 28th April, 1612, died 12th September, 1646), having pledged the duchy of Castro in the *Mont de Piété*, formed an alliance with France in 1633, which protected him against Pope Urban VIII., wishing to forfeit Castro for the Barberini, his relatives. Muratori describes Odoardo as a brilliant and satirical talker, and of a splendid fashion of living.—**Ranuzio II.**, son of Odoardo, was born in 1630, and succeeded his father in 1646. He was ruled by a Provençal tutor and a Pavian tailor of a musical turn. In consequence, he lost the duchy of Castro to Innocent X. He died 11th December, 1694, and was succeeded by his son **Francesco,** who was born 19th May, 1678. During the reign of the latter occurred the Treaty of the Hague, by which it was agreed that Parma and Piacenza should become male fiefs of the empire; and that, when the succession opened, they should go to the eldest son of Elizabeth F., Queen of Spain, daughter of Odoardo, and his male issue, whom failing, to her other sons and their male issue. The undoubted legal claim of Innocent XIII. to the reversion of the duchies was coolly set aside. Francesco died 26th February, 1727, and was succeeded by his brother **Antonio.** In him the hereditary corpulence of the family reached its utmost extent. He died 20th January, 1731, and having no children, left the duchies by will to Don Carlos, the son of his aunt, Elizabeth of Spain. The name has been given to two palaces in Rome—one built by Pope Paul III., and adorned with some fine works of art; the other, known as the *Farnesina*, containing frescoes by Raphael—to a group of statuary representing 'Dirce Bound to the Horns of a Bull,' and to a Hercules copied by Glykon from an original by Lysippus.

Farn'ham ('the dwelling among the ferns'), a town in Surrey, England, on the Wey, 36 miles S.W. of London, with an interesting old castle, founded in 1136 by Henry of Winchester, brother of King Stephen, which has more than once been rebuilt or enlarged, and is a possession of the bishops of Winchester. The chief trade is in hops, which are noted for their excellent quality. William Cobbett was a native of F. and was buried in the churchyard. At a distance of 6 miles lies the camp of Aldershot. The old abbey of Waverley, a Cistercian foundation, was built in 1128 on a spot within two miles of F., and the ruins are still to be seen. Pop. reg. sub-dist. 15,383; and civ. par. 12,376.

Farn'worth, a town of Lancashire, 12 miles S.E. of Liverpool, on the river Irwell. It has a chapel of the 15th c., a free grammar-school, and manufactures of watches, cottons, and iron tools. F. is the birthplace of Bishop Bancroft (1544). Pop. reg. sub-dists. 31,751 (Bolton) and 33,765 (Prescot); and civ. par. 23,758.

Fa'ro (Gr. *pharos*, 'a lighthouse'), a town in the province of Algarve in the S. of Portugal, at the mouth of the Fermoso, 122 miles S.S.E. of Lisbon. It is a bishop's see, is well built, walled, and has a college, cathedral, and several hospitals. The harbour is small but safe, sheltered by islands, and defended by a fort. F. has a large fishery. The trade in fresh and dried fruit, wine, anchovies, sumach, and cork is carried on chiefly with England. Pop. 10,017.

Faröe Isles (Dan. *Faareyjar*, 'sheep islands'), a group of twenty-two basaltic islands in the N. Atlantic, 185 miles N.W. of the Shetlands, in lat. 61° 20′-62° 20′ N., and long. 6°-8° W. Area, 514 sq. miles; pop. 12,782. They are conical mountainous masses, some 2000 feet high, rising more or less abruptly from the sea, and are separated from each other by strong rapid currents. The precipitous shores, rendered dangerous by whirlpools, are broken by many deep inlets, which form secure havens. Stromö, the chief of the group, contains the capital, Thorshavn (pop. 1208), and is 8 miles broad and 27 long. Eight of the group are uninhabited islets. The shallow soil of all the islands affords rich pasture for the sheep and cattle, but there are no trees larger than a juniper or stunted willow. Although often visited by tempests, the climate of the F. I. is comparatively mild, allowing the cultivation of barley, rape, parsnips, carrots, and potatoes. The snow only lies on the ground for about eight days in winter. There are 583 species of plants, of which 270 are flower-bearing. A seam of good Miocene coal has been worked on Suderö, and coal, peat, copper, jasper, and opal have been found in some of the islands. The seas abound with fish, and the rocky coasts are haunted by myriads of seafowl, the capture of which is one of the perilous industries of the islanders. Among the exports, which pass chiefly to Denmark, are salted mutton, skins, tallow, eider-down, goose-quills, and feathers. The F. I. were discovered and peopled by Norwegians in the 9th c., but have been Danish since 1380. A dialect of Old Norse is still spoken, but Danish is used in the churches, schools, courts, &c. The islands, of which the largest are Stromö, Suderö, Osterö, Sandö, and Wagö, send a representative to the Danish *Rigsdag*.

Far'quhar, George, son of a poor clergyman, was born at Londonderry in 1678. He studied at Trinity College, Dublin; at eighteen joined the stage, and shortly afterwards the Earl of Orrery's regiment in Ireland. Like Wycherley and Vanbrugh, he became a captain. His first comedy, *Love and a Bottle*, was brought out successfully at London in 1698. Duped into marrying a pretended heiress, he fell into poverty, and died in April, 1707, 'leaving nothing,' he said, 'but two helpless girls.' His other plays are *The Constant Couple*, *Sir Harry Wildair*, *The Inconstant* (modelled on Fletcher's *Wild Goose Chase*), *The Stage-Coach*, *The Twin Rivals* (1705), *The Recruiting Officer* (1706), and his best piece *The Beaux Stratagem* (1707). F.'s plays are not imaginative and romantic. They are sprightly, natural transcripts of the life of his times. He will not rank with even the secondary Elizabethans, but his place is high among the Restoration dramatists. Inferior to Congreve in dazzling wit, he excels him in humour and invention. His plays are less gross, his characters more genial and lovable, than Wycherley's, Congreve's, or Vanbrugh's. The best edition of F. is Leigh Hunt's in Routledge's *Old Dramatists*. See Hazlitt's *Comic Writers* and Ward's *English Dramatic Literature*, vol. ii.

Farr, William, M.D., F.R.S., D.C.L., was born at Kenley, Shropshire, in 1807, studied at the universities of Paris and London, practised medicine at London, and edited the *Medical Annual* and *British Annals of Medicine*. He was made compiler of abstracts in the Registrar-General's office in 1838, was afterwards for many years head of the statistical department in that office, and was sent by Government to various international statistical congresses. He was corresponding member of the French Institute in 1872, and died 14th April, 1883.

Farr'agut, David Glasgoë, a gallant and highly popular admiral of the American navy, was born near Knoxville, Tennessee, 5th July, 1801. He entered the navy at the age of eleven, was lieutenant at twenty-one, and in 1833 commanded the *Natchez* on the Brazil station. In 1851 he was made assistant-inspector of ordnance, and in 1854 was appointed to construct a navy-yard in California. In January, 1862, he commanded a naval expedition to the Gulf of Mexico, and on the 28th of April received the surrender of New Orleans. Ascending the Mississippi, he took Natchez, but failed before Vicksburg. Withdrawing to Pensacola for repairs, he was made Rear-Admiral of the Navy, and in March, 1863, he sailed up the Mississippi, ran the Confederate batteries of Fort Hudson, and aided General Grant in his attack upon Vicksburg, which surrendered 9th July, 1863. In August, 1864, after a fierce conflict between his fleet and the Confederate forts and vessels of Mobile, he captured the forts and city. F. was raised to the rank of vice-admiral in 1864, and to that of admiral in 1866. Died 14th August, 1870.

Farr'ar, Very Rev. Frederic W., D.D., F.R.S., son of a clergyman, was born at Bombay in 1831, and studied at King's College, London, and Trinity College, Cambridge, of which he was made a Fellow in 1856, obtaining the Chancellor's prize for English verse. He was appointed assistant-master at Harrow in 1855, master of Marlborough School in 1869, chaplain-in-ordinary to the Queen in 1873, canon of Westminster and rector of St. Margaret's in 1876, archdeacon of Westminster in 1883, and chaplain to the Speaker in 1890. F. has been a prolific author. Among his works are *Eric, or Little by Little*, and *Julian Home*, successful tales; *The Fall of Man* (1865); *The Life of Christ* (1874); *Life and Epistles of St. Paul* (1882); *Lives of the Fathers* (1888); *Sketches of Church History* (1889); *Darkness and Dawn* (1891); *The Voice from Sinai* (1892); and *The Life of Christ as Represented in Art* (1894). As a preacher he is famous for his eloquence, and as a reformer he has shown great energy in the direction of *temperance*. In 1895 he was appointed Dean of Canterbury.

Farren, Eliza, an English actress, was born in 1759, and made her début in London in 1777. Besides being a clever and graceful artiste, she possessed great beauty and personal attractions. On 1st May, 1797, she became the wife of the 12th Earl of Derby, and died in April, 1829.

Farr'ier (Old Fr. *ferrier*, from Lat. *ferrum*, 'iron'), a name given to the early representatives of the veterinary surgeon, who to their ordinary occupations as blacksmiths and horse-shoers added that of prescribing for the ailments of domestic animals. In many country districts the F. is still extant. It is needless to remark that his ideas on veterinary matters are marked by much prejudice and ignorance, not, however, unmingled with the rough and ready knowledge obtained by observation.

Farriers, Army, the name given to members of the cavalry regiments, artillery, engineers, and army service corps, who assist the veterinary regimental surgeons, and act as horse-shoers. They rank with and receive the pay of sergeants, and have certain allowances arising out of their occupation. Classes are held (1st June to 31st July) at the Aldershot Veterinary School, which are attended by officers, farriers, shoeing-smiths, and men (in training for the last-named position) of these mentioned corps, and by officers of the Indian Staff Corps, and certificates are granted to those who pass the qualifying examination.

Fars or **Fars'istan** ('Fars' is the native form of the classic *Pers*-ia), a province in the S. of Persia, bounded W. by Khuzistan, N. by Irak, E. by Kirman and Laristan, and S. by the Persian Gulf. Area, 53,125 sq. miles; pop. about 1,364,000. F. comprises the Dashtistan, a sandy, thinly-peopled plain fringing the Persian Gulf, and an upland district, formed by offshoots from the Yagros range, which rise in steep terraces, and are severed by long fertile plains abounding in rich pasture. Around Shiraz there are delightful woody valleys almost destitute of inhabitants, but the E. consists of arid sandy tracts. The chief rivers are the Band Amir or Araxes, the Nabon, and the upper waters of the Tab. F. contains the salt lakes of Nivis and Mahaln. The chief products are fruit, opium, tobacco, cochineal, attar of roses, dates, saffron, hemp, cotton, silk, sulphur, and lead; cutlery, arms, glasswork, cotton cloths, and wine are manufactured. Many sheep, horses, cattle, camels, and asses are reared in the province. The principal towns are Jahrum, Darabgird, Fasa, Firazabad, Kazirun, and Shiraz. F. is famous for its antiquities, of which the most notable are the ruins of Persepolis, Pasarga, and Shakpur. F. belonged to Cyrus the Great before the rise of the Persian Empire.

Farsan' Archipelago, a group of islands in the S.E. of the Red Sea, off the coast of Asiryemen. Only two are of any extent—F. Kebeer, 31 miles long, and F. Seggeer, 18 miles. Sharp, outstretching reefs render them dangerous to shipping.

Far'thing (Old Eng. *feorthung* and *feorthling*, 'the fourth part of anything') now denotes a copper coin, the fourth part of a penny. The term is sometimes applied to articles or circumstances of contemptible value, *e.g.*, a farthing rushlight.

Far'thingale (in 16th c. *verdingale*; from Fr. *verdugalle*, or *vertugade*, a corruption of *vertu-garde*, 'guard of modesty'), a large hooped petticoat worn in the 16th c. See CRINOLINE.

Fa'sa, a town in the province of Fars, Persia, 77 miles E.S.E. of Shiraz. It has manufactures of silk, wool, and cotton. The pop. has been estimated at 18,000. The *district* of F. is 45 miles long by 9 to 15 broad, and, shut in by mountains, is generally known as the *Garm Sar*, or 'warm region.' It produces rice, Indian corn, millet, cotton, and fine tobacco, and contains thirty-three villages.

Fasa'no, a town of S. Italy, in the province of Bari delle Puglie, on the high road from Bari to Brindisi, near the coast, and 33 miles S.E. of Bari. It is famous for its olive plantations. On the coast near F. is the ruined *Egnazia*. Pop. 18,583.

Fas'ces (from the same root as the English 'bind') were a bundle of birch (sometimes elm) rods, with an axe stuck in the midst, the iron of which projected from them. They were carried by officers called lictors before the superior magistrates of regal, republican, and imperial Rome, as a sign of their power of scourging and of capital punishment. When an inferior met a superior magistrate, he ordered his lictors to lower their F., as a mark of respect; and, in the same manner, the consuls at the public assemblies acknowledged the sovereignty of the people.

Fasces.

Fas'cia. These are strong membranes formed of connective tissue which cover the muscles, send septæ or partitions in between them so as to give them support, and in many cases give points of origin to muscular fibres. They are smooth, glistening, and opalescent in appearance to the naked eye. When a portion is teased out and examined under the microscope, they are found to be composed of delicate fibres of connective or white fibrous tissue firmly matted together.

Fascicula'ria, a well-known genus of *Polyzoa* (q.v.) found in a fossil state in rocks of Tertiary age. This genus (of which *F. cerebriformis* of the Miocene rocks is a familiar species) presents a singular structure from the cœnœcium or connecting medium of the *Polyzoon* being more or less spherical in form, and composed of vertical plates arranged not unlike the convolutions of the human brain.

Fascination by Serpents. See SERPENTS, FASCINATION BY.

Fascines' (Lat. *fascis*, 'a bundle of twigs'), bundles of brushwood, generally about 9 inches in diameter, and from 6 to 12 feet long, used in war to fill up a ditch, &c. In civil engineering F. are used to protect the banks of rivers, &c.

Fasci'ola, the name of the genus of *Trematoda* (*Scolecida*) to which the Flukes (q.v.) belong. *F. hepaticum* is the scientific name for the common liver fluke, formerly known as *Distoma hepaticum*.

Fasciola'ria, a genus of Gasteropodous mollusca represented by the tulip whelk and allied species. These shells belong to the family of the *Muricidæ* or Whelks (q.v.).

Fash'ion (Fr. *façon*, 'a mode,' from the Lat. *facio*, 'I make'), literally a particular manner of making anything, is a term applied to a prevalent mode of dressing, speaking, and acting, and even to literary styles and to opinions current in society. F. may thus be an index of deep changes, a result of peculiar social conditions, or the passing reflection of the idlest whim. Thus the broad contrast between the flowing, richly-coloured robes of the East and the dress of Europeans is due to difference of climate and manners of life, while the constant variations of dress in Europe arise mainly from caprice. F. in dress seems to have fluctuated far less in ancient than in modern times. In classic Greece there was comparatively slight variety in costume, and in the arrangement of the filleted or unfettered hair. Plautus, however, tells us that the Roman matrons often altered the materials and shape of their garments. In England there have been several broadly marked fashions of dress. The early English settlers in Britain wore ringed armour and square helmets in war, woollen tunics, short cloaks, and drawers in peace. Their hair was long, and they practised tattooing, though it was forbidden by an edict in 785 until the Norman conquest. The Normans introduced brighter and more costly dresses. Short mantles and long tunics, of brilliant silks and velvets, lined with furs, flowered with gold, and often stiff with jewels, were worn by the nobles, and peaked-toe shoes (*ocreæ rostratæ*) were common. The most minute and faithful picture of English mediæval fashions is to be found in Chaucer's Prologue to the *Canterbury Tales*. In the 16th c. French fashions spread into England, Germany, and Italy. In England during Elizabeth's reign the costume of the wealthy was remarkable for splendid colour and lavish and often fantastic ornament. Men wore slashed doublets of silk, velvet, or damask, jewelled and embroidered with gold and silver, trunk-hose of grotesque width, and cloaks, sometimes short, sometimes trailing on the ground, of red, white, violet, black, green, &c. The female apparel was specially marked by the high linen ruff, and huge Farthingale (q.v.). The reign of Charles I. is the age when English costume was most becoming and picturesque. Van Dyck's portraits have made us familiar with the cavalier dress—the crimson doublet or gold-worked buff coat, the broad plumed Flemish hat, the rich lace collar, the long fringed breeches, the cloak, baldric, and Spanish rapier. The female dress became very graceful, the ruff and farthingale being disused. In Charles II.'s time the King Charles costume was spoiled by extravagant additions, such as petticoat breeches and perukes. The dress of the ladies lost its tasteful simplicity, as is seen by comparing Lely's with Van Dyck's paintings. The 18th c. in England was the age of the Louis XIV. dress, the age of powdered wigs, blue or scarlet coats, embroidered waistcoats, knee-buckles, and high-heeled shoes. In this century it was at one time the F. to carry the hat under the arm instead of on the head, to place black patches on the face, and to stiffen the coat skirts with wire. Fans, canes, and snuff-boxes were incessantly manipulated, a F. which evoked the raillery of Addison and Pope. After the French Revolution more sober costumes were adopted. F. in dress has at times gone to such excess as to call forth royal interference. Thus in England about the middle of the 16th c. there was such a mania for square-toed shoes, that an edict was passed forbidding anyone to wear shoes above six inches broad at the toes. Queen Elizabeth, we are told, placed 'certain grave citizens' at the London gates to cut all ruffs above a 'nayle of a yeard' deep, and to break all rapiers above a yard long. Charles V. of France forbade the wearing of short and tight breeches, which had become a public scandal. There are fashions in literature as well as in dress and social etiquette. After the Renaissance it was the F. to write Ciceronian prose; Euphuism (q.v.) was a literary F. for a time prevalent in England; during one age the sonnet, during another the epic, has been the favourite form of poetry, each successful author inducing others to imitate his theme and manner by the example of his success and influence of his authority. Anagrams, *bouts-rimés*, and similar follies arose from a literary F. now happily decayed. See Planché's *British Costume*, La Bruyère (*Sur les Mœurs*), and Hazlitt's essay on F.

Fash'oda (formerly *Denab*), town and fort on the Upper Nile, lies in the Shilluk country, 380 miles S. of Khartum, in lat. 10° N. Before the Egyptians retired from the Sudan, they maintained a garrison here and exacted a poll-tax from all boats passing up or down the river, which necessitated a delay of some days. Little is known of the place before 1869, and nothing has been reported since the appearance of the Mahdi.

Fastern's, Fasten, or **Fasting Even**, an old Scotch and English name for Shrove Tuesday (q. v.).

Fasti (Lat. *fas*, 'divine law,' or *fari*, 'to speak'; hence *dies fasti* are *lawful days, i.e.*, on which business might lawfully be transacted before the prætor, or days on which judgment could be pronounced—court days) were arranged by the Romans in two divisions:—1. *Fasti sacri* or *kalendares*. These were tables closely resembling a modern almanac, and contained the lore with respect to the days of the year, &c., which for nearly four centuries and a half after the foundation of Rome was retained by the priests, but was then disclosed by Cn. Flavius, who had obtained access to the pontifical books. They contained the months and days of the year, with the nones, ides, market-days, lawful days, unlawful days, the different festivals, &c.; astronomical observations on the rising and setting of the fixed stars, and the commencement of the seasons; and notices of great victories, dedications of temples, &c. Specimens of these F. on stone and marble have been discovered from time to time, the most remarkable being that known as the *Kalendarium Prænestinum*, laid bare in 1770. The F. is the title of a well-known poem of Ovid, which treats of the festivals, &c., according to the order of the Julian Calendar. 2. *Fasti annales* or *historici*. From the resemblance in arrangement of the early historical records to the *F. Kalendares*, the name F. was extended to the registers of consuls, dictators, censors, &c., and generally to the chronicles of the events of each year. The *F. Capitolini*, excavated from the Forum in 1547, arranged by Cardinal Alessandro Farnese, and deposited in the Capitol, are regarded as a most important specimen of this class.

Fast'ing ('fast,' Old. Eng. *faest*, means lit. a 'keeping' away from food, and is the same word as the adj. fast = 'firm,' as in hold-*fast*, stead-*fast*) is a practice based upon the instincts of human nature, and common to all religions. As the effect of deep sorrow is to take away all desire for food, F. has always been regarded as a natural expression of sorrow for sin; and as a formal religious practice the object of it would be to afflict and humble the soul by withholding from the body its ordinary nourishment. 'Afflicting the soul' is the phrase used for it in the Bible (Lev. xvi. 29, 31), evidently as a familiar shortened expression for the fuller phrase of Ps. xxxv. 13, lxix. 10. Having, like asceticism generally, its original home in Asia, it was much practised by the ancient Hindus, Chinese, and Persians, and to a less extent by the Jews; it entered into the religious rites of the Egyptians, Greeks, and Romans, and descended to the Christian Church.

I. *Among the Jews.*—The only fast enjoined upon the Jews as a nation by the law of Moses was on the great day of atonement. Whosoever failed to keep that day with F. was to be cut off from among his people (Lev. xxiii. 29). But there are numerous instances recorded of individuals voluntarily imposing fasts upon themselves in seasons of penitential sorrow, as David (2 Sam. xii. 16), and Ahab (1 Kings xxi. 27); and the vow of Num. xxx. probably referred chiefly to F. A number of other individual cases recorded, as Hannah (1 Sam. i. 7), Jonathan (1 Sam. xx. 34), David (2 Sam. i. 12, iii. 35), had no special connection with religion, but were prompted by sheer grief. Even national fasts were imposed on special occasions, as when the Israelites were defeated by the rebel Benjamites (Judges xx. 26), at Mizpah on the restoration of the ark (1 Sam. vii. 6), under Ahab (1 Kings xxi. 12), and under Jehoshaphat (2 Chron. xx. 3). After the Temple was destroyed, and the people carried into captivity and prevented from worshipping God by means of sacrifices, they attempted to make up for this by an increased observance of fasts, as expressed in a prayer in the Talmud—'Lord of the universe! thou knowest that when the Temple existed, the man that sinned brought a sacrifice, and though only the fat and blood were offered, yet he was forgiven. Now that I fast, and my own fat and blood are consumed, let it please thee to accept this sacrifice . . . as if offered upon thine altar, and be merciful unto me.' The following fasts took their rise during the post-exilian period, and are observed by the Jews to the present day for the reasons assigned. 1. Annual national fasts: 1st, The fast held on the 17th of Tamuz, the fourth month, because on this day (1) the Golden Calf was made, (2) Moses broke the Tables of the Law (Exod. xxiv., *cf.* xxxii.), (3) the daily sacrifices ceased for want of cattle when the city was besieged, and (4) Jerusalem was stormed by Nebuchadnezzar (Zech. viii. 19; Jer. lii. 6). 2nd, The fast held on the 9th of Ab, the fifth month, because on this day (1) God decreed that those who left Egypt should not enter Canaan (Num. xiv. 27-35), (2) the first Temple was destroyed by Nebuchadnezzar, and the second by Titus, (3) the city of Bethar was taken by Adrian, and 580,000 Jews massacred, and (4) the site of Jerusalem was ploughed up, as predicted by Micah (Jer. xxvi. 18; Zech. vii. 3, 5, viii. 19). 3rd, The fast held on the 3rd of Tishri, the seventh month, because on that day Gedaliah and other Jews were murdered at Mizpah (2 Kings xxv. 25; Jer. xli. 1-7; Zech. vii. 5, viii. 19). 4th, The fast held on the 10th of Tebeth, the tenth month, because on that day Nebuchadnezzar began the siege of Jerusalem (2 Kings xxv. 1; Zech. viii. 19). 5th, The fast of Esther, held on the 13th of Adar, the twelfth month (Esther iv. 16, 17, ix. 31). 6th, The first-born sons' fast, held on the day before the Passover (Exod. xii.). 2. Weekly fasts were kept every Monday and Thursday between the Feast of the Passover and that of Tabernacles, and between that which followed (Lev. xxiii. 36; Num. xxix. 35-37) and the Feast of the Dedication, because Moses went up to Mount Sinai to receive the second Tables of the Law on a Thursday and came down on a Monday, *cf.* Luke xviii. 12.

II. *In the Christian Church.*—Although our Lord condemned the Jewish manner of keeping their fasts (Matt. vi. 16), and did not impose F. regularly on his disciples (Matt. ix. 14), he yet speaks of it along with prayer as a source of spiritual strength (Matt. xvii. 21), indicates that it would be beneficial to his disciples after his removal from them (Matt. ix. 15), and even practised it himself on a memorable occasion (Matt. iv.). It was practised and recommended by the apostles (Acts xiii. 3, xiv. 23; 1 Cor. vii. 5). From a very early time F. was a part of the discipline of the catechumens, preparing them for baptism, and it soon came to be regarded as also necessary before partaking of the Eucharist. This could not be, so long as the latter was connected with the Agapæ (q.v.), but in the 4th c. Basil, Chrysostom, &c., insisted on the guilt of giving the Holy Communion to persons not F. The bi-weekly Jewish fasts described above were soon received into the Church, Monday and Thursday, however, being changed to Wednesday and Friday in commemoration of the betrayal and sufferings of Christ. These fasts, which were observed every week except between Easter and Pentecost, did not last all day, but only till three o'clock, and hence were called *stations*, as if watches of the soldiers of Christ, and *half-fasts*. By the 3rd c. fasts came to be much practised as a safeguard against demons. But while the number of them increased, laxity in the observance of them also increased; for whereas at first F. meant entire abstinence from food, by the 4th c. many thought it sufficient to abstain from flesh and wine, which afterwards came to be the general understanding in the Western Church. The first four of the Jewish post-exilian fasts enumerated above were also introduced into the Church, according to tradition by Callistus, Bishop of Rome, about 223. To un-Judaise them they were connected with the four seasons (Lat. *jejunia quatuor temporum*, corrupted into Ember Fasts), being fixed by the Council of Mainz in the time of Karl the Great to the first week in March, the second week in June, the third week in September, and the week immediately preceding Christmas Day. More sacred than all the rest was the fast preceding Easter (see LENT), although up to the 4th c. it was left optional, and the exact length of it was not finally fixed till the 6th c., or, according to some, the 8th c. About the middle of the 5th c. a new fast was instituted in France and soon adopted elsewhere, under the name of the Litany or Rogation Days (q.v.), being the three days before Ascension Day. Besides these, and the Vigils (q.v.) or eves of holy-days, there were many other fasts having merely a local or partial observance. From the 6th c. F. began to be imposed as a mode of penance. In the *Penitentiary* of Theodore, Archbishop of Canterbury (668), three fasts of forty days each—before Easter, before the Nativity, and after Pentecost—are appointed to be held every year as special seasons of confession and penance. The fasts appointed to be observed by the Book of Common Prayer of the Anglican Church are Lent, the Ember days, the Rogation days, all Fridays except Christmas Day, and the vigils before certain festivals. See Blunt's *Dictionary of Doctrinal and Historical Theology*; Smith's *Dictionary of Christian Antiquities*; Bingham's *Ecclesiastical Antiquities*.

Fat is a tissue found in many parts of the body, and is composed of a meshwork of fine connected tissue, in which lie embedded cells called *F. cells*. These are round or oval if lying apart, but if they happen to be packed closely together, they may acquire an angular form. Their average size is from $\frac{1}{300}$ inch to $\frac{1}{600}$ inch in diameter. Each consists of a delicate transparent envelope of an albuminous substance, surrounding a single drop of fluid fatty matter. Young F. cells have a nucleus, but this becomes obscured, and may entirely disappear in old F. cells. Fatty tissue is sometimes termed adipose tissue. It is copiously supplied with blood-vessels.

Chemical Composition.—The F. of the human body is a mixture of margarine and oleine, which are in turn formed of a base, glycerine, combined with the respective fatty acids, margaric and stearic acids. The F. of oxen and sheep contains, in addition, another substance called stearin. During life it is in the liquid state, but it solidifies after death.

Uses of fat.—(1) It serves as a soft, elastic, and light packing for the various vacuities which are in the body. (2) It facilitates motion by diffusing pressure, and it also protects delicate organs from pressure. (3) It gives a smoothness to the contour of the body, specially observable in the graceful lines of the human female. (4) Being a bad conductor of heat, it prevents heat from escaping from the body, and thus assists in maintaining the equable temperature of the body. (5) Consisting largely of carbon and hydrogen, by its combustion in the lungs or in the tissues, it is a great source of animal heat, being converted, by union of its elements with oxygen, into carbonic acid and water. (6) It assists largely in the general nutrition of the body, almost every tissue containing more or less of this substance.

Source of fat.—F. is derived in the body from three sources—(1) from F. introduced as such in the food; (2) from hydrocarbons, such as starch and sugar, which are converted into F.; and (3) from a special kind of retrograde metamorphosis, or splitting up of the albuminous tissues.

Fa'talism (from *fatum*, what is spoken and therefore irrevocable) is, according to Leibnitz, of three kinds. There is the F. of Mahomet, which supposes that if the effect were predetermined it happened without the cause—*Kismet*, 'it is fated'; 'ye cannot will, unless the Lord willeth.' Next comes the F. of the Stoics, which taught men to be quiescent, for they were powerless to resist the course of things. There is a third F. held by Christians, which admits a certain destiny of things regulated by the providence of God. 1. Pure F., based on the Greek idea *eimarmenē*, 'what is allotted,' or *moira*, 'the awarded lot' (which is perhaps seen in the Homeric *aisa*, *aei ousa*), or on the Chaldæan idea of astrological fate, undoubtedly means that our actions do not depend on our desires or volitions, and that a higher power bends us to its will, against which it is vain to struggle (*ineluctabile fatum*). The reasoning of the Turk under impending calamity is (or was)—'If this is fated to happen, I cannot prevent it; if not to happen, why should I exert myself.' 2. The description of Leibnitz is unfair to the Stoics. Chrysippus undoubtedly held that the human will is always determined by motives, but he did not even maintain the modified form of F. according to which our character is made *for* us, and not *by* us, so that we should in vain attempt to alter it, and are therefore not responsible for our actions. There is in this, of course, a portion of truth, viz., the law of heredity, which has frequently given a powerful interest to psychological romance, and which is occasionally illustrated in actual life. But the position of the Stoics was practically the reverse of this. They laid stress on a man's power to transform and discipline his own mind, controlling or suppressing some emotions, generating others, forming new intellectual associations. They recognised the unchangeable laws of life, and endeavoured to bring the character into harmony with the Kosmos. It was the man of ill-regulated life who came into conflict with the overruling force—*Ducunt volentem fata, nolentem trahunt.* 3. It is an interesting question whether Christians are fatalists to any extent. The verdict of psychology is simple enough; the normal healthy human character is amenable to moral discipline, and we can improve it if we desire. But apparently the volitions tending to improve character are theoretically as capable of prediction as others. This view is entirely consistent with the Christian doctrine of the fore-knowledge of God, and with the predestination of the body of Christ. Nevertheless the Church has frequently condemned views of individual predestination. Many theologians contend that while free-will was lost by the fall, the bondage of the will to sin does not preclude absolute individual responsibility; although it is also maintained that nothing can be done without grace. But whatever may be said of Christian theology, it cannot be doubted that the preaching of the Christian religion has been one of the greatest anti-fatalistic influences in the world.

Fata Morga'na, the name of a sorceress in the Romance poetry of Italy, who showed her magic power by raising up visionary spectacles in the air; hence the name given in Italy to a mirage seen in the Strait of Messina—images of men, ships, houses, &c., showing themselves both in the air and the water.

Fateh-Ali-Shah, King of Persia, was born in 1762 and ascended the throne in 1798. Four years later, war broke out between Russia and Persia, owing to the former's aggressive policy in the direction of Georgia, and continued during eleven years. At length, in 1813 a treaty was signed between the powers under which the Shah ceded Georgia to Russia. In 1826 further disputes arose about the demarcation of the frontier and a war of two years resulted in the defeat of the Persians. F.-A.-S. died in 1834.

Fates. See PARCÆ.

Fa'ther. See PARENT AND CHILD, FAMILY, AND PATRIA POTESTAS.

Father Lasher, a species of Teleostean fishes, belonging to the Gurnard family (*Triglidæ*), and to the sub-family *Cottinæ* or Bullheads (q.v.). In this genus the head is very broad and flat. No scales exist. The dorsal fins are of moderate size, and no palatine teeth are developed. The F. L. has its head armed with long sharp spines. It is common on our coasts, and is frequently found amongst rocks and tangle at low water. Its average length is 10 inches; its upper parts are brown coloured, and its under parts white. Both are marbled with darker colours, and the fins especially are so marked. The F. L. is also known by the names 'long-spined cottus' and 'lucky proach.'

Fathers, Christian, or **Fathers of the Church**, is a title given to the ancient Christian writers who belonged to the communion of the Church. The name of *Apostolic Fathers* (q.v.) is given to those of the 1st c. who, according to tradition, were disciples of the apostles. Various limits of time down to which the name ought to be applied have been adopted—any time from the 3rd c. to the 7th c. A common division is to make the Patristic period end with the 6th c., and the Hierarchical begin with the 7th c. In its widest application the period extends to and includes St. Bernard in the 12th c., after which theologians receive the name of Scholastics. Not less various have been the estimates formed of the importance and value of their writings. As a rule, that estimate has been higher in the Roman Catholic Church than in the Protestant Churches. This is connected with the Roman Catholic doctrine regarding the Rule of Faith (q.v.), in which Tradition—at once the *interpreter* and the *supplement* of Scripture—plays so important a part. As the same authority is held to be due to the former as to the latter, it follows that the writings of the F., in which this tradition is chiefly contained, are inspired and infallible as well as Scripture. At the same time several Roman Catholic writers, when they started with the theory that doctrines were to be settled not by individuals, but by councils or the Church, have pointed out with remarkable candour the defects of the F. Protestants, who hold the Holy Scriptures to be the only infallible rule of faith and practice, in seeking to refute the Roman Catholic doctrine regarding tradition, went to the opposite extreme in their treatment of the F.: in seeking to drag to the light all the errors and faults of their writings, they naturally overlooked all that was valuable in them. Thus, although Daillé in his *De Vero Usu Patrum* (1631), the first thorough Protestant work that appeared on the subject, did not fail to point out their merits, the opinion generally adopted, at least by Calvinistic Protestants, was as one-sided as that of the Roman Catholics; and the prejudice against the F. which has been handed down among them, until quite recent times, as unreasonable as the adoration of the Church of Rome, for it was deemed right to despise, ridicule, and reject the whole body of their writings. It has been otherwise in the Church of England, which in her Church polity did not go so far as the Calvinistic Churches in opposition to Romanism, and in her doctrine did not so closely follow Augustine, who differed widely from the other F. She has always entertained great reverence for them, and the exaltation of them was a marked characteristic of the Tractarian revival.

Looked at without prejudice, the F. appear to be neither without great faults nor great excellences. Judged by the standards of the present day, they were very deficient. They were superstitious and credulous in a high degree. Only a few could be called learned, and as a body they were ill qualified to be interpreters of Scripture, being ignorant of the original languages, and too fond of allegorizing. On the other hand, they were laborious and diligent, devotedly attached to the religion they professed, and zealous and courageous beyond all praise in its defence. To judge them fairly, they must be viewed in the light of their own time; and, taken for neither more nor less than what they are, their writings are of incalculable value for tracing the development of doctrine and practice in the early Church. Among the more famous of the F. may be mentioned (1st c.) Clemens Romanus, Polycarp, Papias; (2nd c.) Justin Martyr, Irenæus, Clemens Alexandrinus, Tertullian; (3rd c.) Origen, Hippolytus, Cyprian; (4th c.) Eusebius Pamphili, Athanasius, Basil, Chrysostom, Gregory Nazianzen, Ephraem Syrus, Hilary, Lactantius, Ambrose, Jerome, Augustine; (5th c.) Cyril of Alexandria, Theoderet, Theodore of Mopsuestia, Pope Leo I., Orosius; (6th c.) Procopius, Gregory the Great, Gregory of Tours, Gildas, Isidore, all of whom receive separate treatment. See Donaldson's *Christian Literature and Doctrine*, Davidson's *Sacred Hermeneutics*, Mosheim's *Church History*.

Fath'om (Old Eng. *faethm*; comp. Dutch *vadem*, Ger. *fadem*; perhaps connected with Lat. *spatium*, 'a space'), a measure of length in nautical surveying and in mining, 2 yards or 6 feet, *i.e.*, about the distance between the finger-tips of a man of average size when his arms are extended horizontally. It is also used metaphorically to express the reach of a man's capacity, 'I cannot fathom it' being equivalent to 'I cannot comprehend it.'

Fatima or **Fatimah**, a daughter of Mohammed and a wealthy widow, Chadidja by name, whom he first served as camel-driver and afterwards married, while he was under thirty years old. At an early age F. was married to her cousin, Ali, who was surnamed 'The Lion of God,' and stoutly supported his father-in-law after he assumed the character of a religious teacher. F. was much beloved by her father. She passed away a few months after his death.

Fat'imides, or **Fat'imites,** a dynasty of caliphs who ruled Egypt and the N. of Africa from the 10th to the end of the 12th c. They were so called from their founder, Obeidallah Almahdi, who declared that he was descended from Fatima, daughter of Mohammed, and wife of Ali, an assertion which most Arab historians disbelieve. Obeidallah, with the help of the Berbers, dethroned the last of the Aglabites, who governed at Tunis, and made himself ruler of N. Africa from the Atlantic to the borders of Egypt. Moez, the fourth caliph, subdued Egypt and founded Cairo. His fleets defeated the Spaniards, and his armies conquered Palestine and part of Syria. Hakem, the sixth caliph, was a fanatic, who proclaimed himself a god, and is still worshipped by the Druses. He persecuted the Christians with fierce bigotry, and was assassinated in 1021. In the reign of Mostanser, the eighth of the F., the Turks were driven back from Egypt. Mostali, the ninth caliph, was defeated by the Crusaders under Godfrey de Bouillon at Ascalon. During the reigns of his successors, the power of the F. dwindled away, until in 1169 the dynasty ended in Aladhed-Sidinallah, the fourteenth of the F., who was dethroned by Saladin, the founder of the Ayubite sultanate. See Mill's *History of Mohammedanism.*

Fats. The F. form an abundant group of compounds occurring both in the animal and vegetable kingdoms. In animals the secretion of fat takes place most abundantly immediately below the skin, and in the neighbourhood of the omentum and kidneys; in vegetables principally in the seed and fruit. All F. contain the elements carbon, hydrogen, and oxygen, united in various proportions. Together with many oils, they are characterized by the action which ensues when they are treated with superheated steam and caustic alkalies. By the first of these agents they are resolved into glycerine and a fatty acid; by the second, into glycerine and a salt of the fatty acid, or *soap*. F. are indeed the ethers of glycerine, and are lighter than water, in which liquid they are insoluble. They may be dissolved in ether, bisulphide of carbon, turpentine, &c. They melt when they are heated, their fusing point increasing with the proportion of carbon they contain. When strongly heated they are decomposed into acroleine, various hydrocarbons, &c. The most important of the animal F. is stearine, and of vegetable F. palmitine. They are employed in the manufacture of soap, glycerine, and candles, and in medicine in the preparation of ointments.

Fatt'y Acids. See OILS.

Fatty Degenera'tion is attended by a continually increasing accumulation of fat replacing the minute elements of tissue in different organs, and is essentially a sign of weakness or of death of the part, the elements of the tissues which perish being replaced by fat-granules. F. D. is quite distinct from accumulations of fat which do not replace other elements of tissue. Examples of F. D. may be seen in the minute elements of the muscular tissue, especially of the heart; in the acini of the liver, the blood-vessels, &c. Nearly all cell structures may undergo F. D., except, perhaps, red blood corpuscles, and the elements of nerve tissue. Yellow softening of the brain, however, is described as a form of F. D. *Arcus Senilis* (q.v.) is due to F. D. of the substance of the cornea, and is regarded as symptomatic of similar degeneration in other parts of the body. There is no kind of tissue, healthy or morbid, which may not undergo F. D., and it consequently gives rise to a great variety of local diseases. F. D. of the heart, or of the larger vessels, or of those passing through important organs, such as the brain, generally terminates in sudden death by rupture, followed by syncope.

Fatu'ity. See INSANITY.

Fat'uous, in law. A F. person is one who is not of right mind and is altogether foolish. A F. person, or an idiot, is legally incapable (see CAPACITY, LEGAL) of managing his affairs. See IDIOTS and LUNATICS.

Fau'ces, the Latin name of the throat, or opening between the mouth and the pharynx.

Fau'cher, Léon, a French statesman, was born at Limoges, 8th September, 1803, and first emerged into notice after the Revolution of 1830, when he began to write for the Liberal opposition papers. He had already given his attention to economics, proposing a southern union to counterbalance the German *Zollverein*, and arguing for common work in prisons, and the separation of town and country convicts for different kinds of work. In 1845 he published his valuable *Études sur l'Angleterre* (chiefly of the industrial centres), which did much to spread free-trade principles in France. In 1846 he entered the Chamber of Deputies, and spoke on the currency and on the reform of the customs tariff. In the Revolution of 1848 he occupied an independent position, criticizing the paper-money and other financial proposals of the Provisional Government, arguing against the limitation of the hours of labour, and suggesting that the masses in the national workshops, '*nourris par la patrie*,' being dangerous in Paris, should be sent to work on the railways. As Vice-President of the new Legislative Assembly he strongly opposed the tendency to sentimental, paternal government; he was always the unsparing critic of the Socialist budget. F., who believed in the possibility of a parliamentary government under the presidency of Napoleon, was for six months minister, but retired when the *plébiscite* by universal suffrage was proposed. He died at Marseille, 14th December, 1854. See his *Mélanges d'Économie Politique et de Finance* (Par. 1856), published by his friend Wolowski.

Fau'cit, Helen, an English actress, born in 1816, made a successful *début* as Julia in the *Hunchback*, at Covent Garden, London, in 1836. She soon rose to the summit of her profession, became a member of Macready's companies at Covent Garden and Drury Lane, and won wide repute for her refined, powerful rendering of Juliet, Beatrice, Imogen, Rosalind, Lady Macbeth, and other Shakespearian characters, and as the heroine in various pieces by Lytton, Browning, and Westland Marston. Her representation of Antigone was a remarkable success, and called forth an eloquent tribute from De Quincey. After her marriage with Sir Theodore Martin, in 1851, this gifted actress continued to appear at intervals on the stage, but only for charities, &c. The charming work, *On some of Shakespeare's Female Characters*, was published by her in 1885, and in this she sets forth, as studies, the characters of Beatrice, Desdemona, Imogen, Juliet, Ophelia, Portia, and Rosalind.

Fault, in geology, is a fracture, accompanied by a displacement, which breaks the continuity of the strata, altering the relative levels of contiguous portions.

Fault, in law. If the quality of a commodity sold prove inferior to what was represented, the buyer may reject it. Even if the buyer saw the goods, a *latent* F. may entitle him to reject them, and should they perish in consequence of it, he will be relieved from payment, or entitled to recover the price. But if the F. or deficiency of a commodity seen by the buyer is manifest, the rule is *Caveat emptor*, *i.e.*, the risk is the buyer's. Challenge on ground of F. must be without unnecessary delay.

Faun, or **Faun'us** ('the favourer,' from *faveo*, 'I favour'), in the mythic history of Italy was the third king of the Laurentes, and was noted for his devotion to hunting, cattle-breeding, and agriculture. He came to be worshipped both as a rural and as a prophetic divinity. His festival (the *Faunalia*) was celebrated on the 5th of December. F. was also the dream-god, hence he and his wife, Fauna, were known respectively as *Fatuus* and *Fatua*, the foretellers of destiny. His appearances under the images of fauns, half man, half goat, correspond with the satyrs of Greece; hence F. was identified with the Arcadian Pan after the myths of the Greeks had emigrated into Italy.

Faun'a, the name applied to indicate the entire *animal* population of any given continent, country, or region. The term is used in opposition to that of *flora*, applied to the *plant-life* of any district. The name F. is derived from the Roman fauns or satyrs, who were supposed to protect wild animals.

Fau'riel, Claude, a French scholar and critic, was born at St. Étienne, Loire, 21st October, 1772. After acting as private secretary to Fouché from 1799 to 1802, he devoted himself to literature, and became one of the most profound and widely accomplished scholars of modern France. In 1830 he was appointed Professor of Foreign Languages at Paris; and there for fourteen years he delivered most ingenious and learned lectures on comparative philology, the sources of French and Italian, the Spanish drama, Servian poetry, &c. F. died at Paris, 15th July, 1844. His great work is his *Histoire de la Gaule Méridionale sous la Domination des Conquérants Germains* (Par. 1836). It is a masterpiece of learned research and brilliant art. Another admirable production is *Histoire de la Poésie Provençale* (Par. 1846), in which he traces the origin of many of the chivalric ideas of honour, love, and gallantry in ancient poems of the Christians fighting with the Moors, or of the Aquitanians struggling against the Karoling kings. Another part forms a work on Dante and the Italian language (1854).

Fausse-Braye, a low rampart raised round a fortified place, now disused in fortification.

Fausse-Rivière ('false river'), a lake in Louisiana, U.S. of America, formerly a channel of the Mississippi; hence probably the origin of the name.

Faust. The F. legend, a favourite subject in European literature, arose during the struggles of Christianity with magic. Its main incident, the sale of a human soul to the devil, can be traced to the 6th c. tale of *Theophilus* by Eutychianus, which was translated by Germans and Scandinavians, occurs in Hroswitha and in the *Aurea Legenda*, and was popularised in the 13th c. by Rutebeuf's *Miracle de Théophile*. Hans Sachs has a similar story. In the 16th c. this legend of selling a soul was attached to the name of F. It has been said that the monks connected the tale with F. the printer in revenge for the injuries which his art caused their lucrative trade of book-copying; but the true protagonist of the modern version of the legend seems to have been a Georg or Johann F., perhaps the printer's son, *professor of magic* at Cracow University early in the 16th c. He was a reputed necromancer, known to Melanchthon, who relates tales of his *diablerie*. The Polish legend of Twardowski, the printer of Cracow, who sold himself to Satan, seems to have grown from a confusion of F. of Cracow with F. the printer. The first version of the old legend, thus associated with the name F., was given in the *Volksbuch* of Spiess (1587), and on it Christopher Marlowe based his *Tragical History of Dr. Faustus*. In the narrative of Spiess and Widmann (1599), Helen of Greece is bestowed by Mephistopheles upon F. in place of a legitimate wife, but Margaret has not appeared. In Scheible's *Das Kloster* (1728) we meet with 'a beautiful but poor girl,' whom F. is prevented by supernatural interference from marrying, and who in succeeding versions gradually rises in importance, and finally becomes the Margaret of Goethe. Attempts have been made to find a common origin for the legends of F. and Don Juan (q.v.), and C. Grabbe, a German dramatist, wrote a play in which both F. and Don Juan appear. The story is still popular in Germany. The most notable poems upon it are Klinger's *F.'s Leben* and Goethe's masterpiece. Lessing wrote a drama on the F. legend, which, with the exception of a fragment, is unfortunately lost. Goethe's *F.*, having been turned into a libretto by Barbier and Carré, received an operatic form from Gounod. The plot of Calderon's *Magico Prodigioso* is similar to the F. legend, as is an old French play, *Mystère du Chevalier qui donna sa Femme au Diable* (1505), and, in a less degree, Byron's *Deformed Transformed*. **Johann F.** or **Fust,** a goldsmith of Mainz, who, along with Gutenberg, Schöffer, and Coster, is accredited with the invention of printing by movable metal types. In 1450 he entered into partnership in the business of printing with Gutenberg (q.v.), whom he sued in 1455 for 2020 florins, which he had lent him—a loan which some maintain to be the only furtherance F. gave the new art. Decision being given against Gutenberg, F. acquired his printing apparatus, and, aided by Schöffer (q.v.), carried on the business prosperously until the sack of Mainz in 1462. F. died of the plague at Paris in 1466.

Fausti'na, Annia Galeria, married Antoninus Pius several years before the death of Hadrian, and when he became emperor, A.D. 138, received the title of Augusta. She died A.D. 141.—**Annia F.,** daughter of the preceding, married Marcus Aurelius about A.D. 145, and died 175. Both mother and daughter are noted for their infidelity to their husbands, and for the honours which their husbands, faithful to the unfaithful, heaped upon them before and after their decease. Attempts have been recently made to construct a more favourable reading of the character of the wife of Marcus Aurelius.

Fausti'nus I., a negro emperor of Haiti, originally Faustinus Soulouque, was born at Santo Domingo, 1789, served in various humble capacities, rose to the rank of captain in the army, and was eventually elected president of the republic in 1847. He caused a frightful massacre of mulattoes at Port-au-Prince, 16th April, 1848, and in the following year proclaimed himself emperor, continuing to reign till forced to abdicate by the revolution of 1859. He died 6th August, 1867.

Fava'ra, a town of Sicily, 4 miles E. of Girgenti, and near the left bank of the Hypsas, a tributary of the Acragas. A fine castle of the 14th c. is the most remarkable building. There are sulphur pits in the neighbourhood. F. has some trade in sulphur, olives, and other fruits. Pop. 16,842.

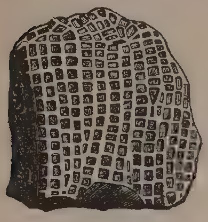
Fav'art, Charles Simon, born in Paris, 13th November, 1710, may be called the author of the *opéra comique* of the 18th c. He aroused the jealousy of the French and Italian comedians, and for some time carried on his theatre in the Flemish camp of Marshal Saxe. Madame F. was the first actress who had the courage to abandon the absurd *bergère de Watteau* dress on the stage, and to begin the reform of costume. The collected works of F. and his wife appeared as the *Théâtre de M. et Madame F.* (Par. 1763-72). F., who composed about sixty comediettas of merit, died 12th May, 1792. His son was an actor of some merit, and his grandson, **Antoine Pierre Charles F.** (born 1784), was also a dramatic author, a painter, and diplomatist, and with Dumolard issued the *Mémoires et Correspondence* of his grandfather (1809). An adopted daughter of Antoine, **Marie F.** (born in 1833), became famous as an actress in comedy.

Fa'versham, a seaport of Kent, opposite Sheppey Island, on a stream flowing into the E. Swale, and 47 miles E.S.E. of London. It consists mainly of four streets, which form a cross, with the market-place in the centre. The trade is principally in coal, timber, corn, hops, and fruit. There are also breweries, brickworks, and large powder-mills. The oyster fisheries, however, are the chief industry. F. is the old English *Fifresham*, where King Æthelstan held a witenagemot in 930. King Stephen built and endowed an abbey here in which he, his wife, and his son, Eustace, were buried. F. is said to be the scene of St. Crispin's apprenticeship. Pop. parl. div. of county 69,345; mun. bor. 10,478; reg. sub-dist. 14,925; and civ. par. 10,660.

Favigna'na (anc. *Ægusa*), an island 6 miles off the N.W. coast of Sicily, forming one of the Trapani Islands, the ancient *Ægates*. It is 6 miles long by 2 broad, is well watered, has rich pastures, and several quarries, and produces wool and excellent wine. The tunny and anchovy fisheries are extensive. Its chief towns are F. and San Giacomo, of which the former is the larger, having a pop. of 5846.

Fav'osites (Lat. *favus*, 'a honeycomb'), a genus of

Sclerodermic Corals (q.v.) found in a fossil state in the Silurian, Devonian, and Carboniferous rocks, but also represented by living species. They belong to the Tabulate division, and the family *Favositidæ* is recognised by having both septa and corallites distinct, with little or no connecting substance or cœnenchyma.



Favosites.

Favospon'gia, a well-known genus of Fossil Sponges (q.v.) occurring in the Upper Silurian rocks. This genus belonged to the section *Calcarea*, or that of the calcareous or limy sponges.

Fa'vre, Jules Claude Gabriel, born at Lyon, 21st March, 1809, of a mercantile family, came to the Paris bar about the time of the Revolution of 1830, and soon made a reputation by his striking appearances in some of the great political trials. He was an extreme Radical, very independent in character, and a powerful and ready, though somewhat bitter, speaker. After the Revolution of 1848 he held the office of Minister of the Interior, and drafted Ledru Rollin's election despatch to the local officials, which, though not unusual in French politics, was especially offensive in the case of a ministry pledged to the abstract rights of the people. On the President's election he passed into opposition, and spoke in favour of the freedom of the press and against the Roman expedition and the law of deportation. He refused to take the oath required by Napoleon after the *coup d'état*, and resumed his work at the bar. In 1858 he defended the political criminal Orsini, and subsequently entered the *Corps Législatif*, where he always spoke on the extreme Left, supporting the Austrian war of 1859 and condemning the Mexican expedition. At the Paris elections of 1869 he was run close by Rochefort, the editor of *La Lanterne*. In September, 1870, F. became Minister of War, and attempted at Ferrières to negotiate an armistice, during which a Constituent Assembly might be elected, but the conditions required by Bismarck were too harsh. He afterwards held the portfolio of Foreign Affairs, but in 1871 withdrew again to the bar. In 1876 he was elected to the Senate for Rhône department. F. was a member of the French Academy, an honour merited by his classic eloquence. He died 20th January, 1880.

Fawcett, Right Hon. Henry, the son of William F., an alderman and magistrate of Salisbury, was born at Salisbury in 1833, educated at King's College School, London, and at Trinity Hall, Cambridge, where he graduated with high mathematical honours as B.A., in 1856, and took the degree of M.A. in 1859. On 17th September, 1858, he was accidentally shot in the eyes by his father while partridge-shooting, and totally deprived of sight. In spite of this great calamity he kept up his studies, and with indomitable courage continued to the end of his life to engage in riding, fishing, and other athletic exercises in which he delighted. By his political essays he soon gained a considerable reputation, and in 1863 was elected Professor of Political Economy at Cambridge. In 1864 he published his *Manual of Political Economy*, in 1865 his *Lectures on the Economic Position of the British Labourer*, and in July of the same year was elected M.P. for Brighton, for which he was again returned in 1868. He opposed and defeated the Irish Universities Bill in 1873, and to this may be attributed the loss of his seat for Brighton in 1874. But in the same year he was elected for Hackney, for which he was again returned in 1880, when, on the formation of Mr. Gladstone's administration, he was appointed Postmaster-General, in which capacity he inaugurated many valuable reforms, particularly in the money order and savings bank systems. He was the originator of the Postal Order, Parcel Post, and Post Office Annuities schemes, reduction in cost of money orders, penny postage stamp savings cards, &c., while he had in contemplation the inauguration of sixpenny telegrams afterwards carried out by his successor. F. also showed himself anxious to improve the condition of Post Office employés, introducing or contemplating the introduction of many reforms for their benefit—benevolent schemes which his premature death frustrated. He also largely extended the employment of women in the Post Office. F. married, in 1867, Millicent, daughter of Newson Garrett, of Aldeburgh, Suffolk, the authoress of *Tales in Political Economy* (1869), and, jointly with her husband, a volume of essays and lectures. The University of Oxford in 1880 conferred on F. the degree of D.C.L., and in 1882 the University of Wurtzburg that of Doctor of Political Economy. In 1883 he was elected Lord Rector for Glasgow University. On 6th November, 1884, he died at his own house in Cambridge, after a few days' illness, of pleurisy. His life was a bright example of what can be accomplished in the face of difficulty and what seemed a crushing calamity by courage and perseverance.

Mrs. Fawcett is one of three sisters who have all by their talents taken a prominent position in public life. One, Dr. Garrett-Anderson, was the first lady licensee of the Apothecaries' Hall, and became Dean of the School of Medicine for Women. Since her husband's death, Mrs. Fawcett's pen and voice have constantly been used for the furtherance of social reforms, especially in the interests of women and the working classes. She has energetically advocated the Higher Education of Women and the extension of the parliamentary franchise to women. In 1889 she was appointed President of the Women's Unionist Association.—**Philippa Garrett F.**, daughter of the Rt. Hon. Henry and Mrs. Fawcett, was born in 1868, and was educated at Clapham High School, Bedford College, and Newnham College, Cambridge, where she won a scholarship and achieved the high position, in the Mathematical Tripos of 1890, of being ranked above the Senior Wrangler.

Fawkes, Guy (properly **Guido**), an English gentleman, born of a Protestant family at York in 1570. At an early age he became a Roman Catholic, and on his return from the Low Countries, where he had served in the Spanish army, he became head of the Gunpowder Plot (q.v.), a conspiracy formed by several fanatical Catholics for blowing up James VI. and the members of the Commons and Lords, on 5th November, 1605. F. was seized when about to fire the train, was put to torture, and executed in Palace Yard, Westminster, 31st January, 1606. It was formerly the custom in English towns to burn his effigy every 5th November.

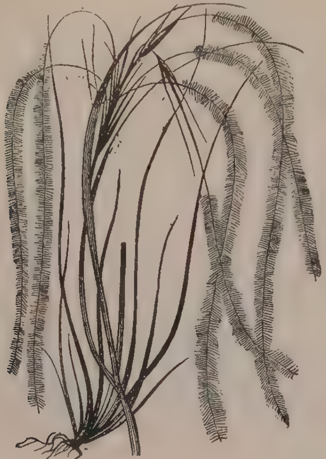
Fayal' or **Faial** (Port. *faya*, 'a beech-tree'), one of the Azores (q.v.). It is extremely fruitful, grows myrtles, firs, palms, pine-apples, vines, and orange-trees, and exports largely fruit and wine. Horta, the capital, is a favourite 'port of call,' for provisions and repairs. Pop. 23,630.

Faydit or **Faidit, Anselme**, born at Limousin, at an early age took to a strolling life, as a juggler, buffoon, and finally as troubadour. He attracted the attention of Richard Cœur-de-Lion in the course of an entertainment, and the King became his patron. He accompanied his master to Palestine, and died in 1220.

Fayûm' or **Fayoom** (from the Coptic *Pi-om*, rendered by Wilkinson 'the cultivated land,' and by Mariette 'the sea'), a division or *murdirieh* of Upper Egypt, on the W. side of the Nile, about 65 miles S.W. of Cairo, and 30 miles W. of Beni-Suef. It lies in a depression of the Libyan waste, and is only connected with the Nile valley by a single gorge. Area, 493 sq. miles, 100 of which are occupied by the Birket-el-Kerun ('the horned'), the Lake Mœris of the Greeks. In spite of an arid soil, F. is one of the richest parts of Egypt, yielding figs, dates, grapes, apricots, olives, and roses for the perfume factories. Medinet-el-F., the capital, stands about 25 miles to the S.E. of Lake Birket-el-Kerun, and on the site of the ancient Krokodilopolis. Pop. 228,709.

Fealty (Old Fr. *féalté*, from the Lat. *fidelitas*), in English law, was the oath of fidelity sworn by the vassal to his lord. Under this oath the vassal or tenant bound himself to do his lord no bodily injury, and no harm in his house secretly, in his reputation, and in his possessions; and also to offer no impediment but rather to assist his lord in doing good. The word has not now any practical signification.

Feather Grass, a genus of grasses, so named from the great development of the awns, which in many species resemble a feather, as in the common F. G. These grasses occur more abundantly on the Continent than in Britain, and are frequently used in room decorations, the long awns having an elegant and graceful appearance. They are often dyed. The awns are supposed to favour the dispersion of the seed, and its feration in the soil.



Feather Grass.

Feathers, the name given to the characteristic appendages of the skin of Birds (q.v.). They present the exoskeleton or outer skeleton of birds, just as scales represent that structure in fishes, reptiles, &c. They are formed in little *papillæ*, or rounded processes of the *dermis*, or true skin. The papilla which gives origin to a feather exhibits a deep middle groove on one side, this groove being broadest and deepest at its base, but shallower as it approaches the extremity of the papilla. Other grooves, which may be called *secondary*, are given off at right angles from the primary groove. These secondary grooves are closely set, and extend almost wholly round the papilla, but vanish at the side opposite to that on which the median primary groove is situated. Smaller grooves, which may be named *tertiary*, are given off from the secondary grooves, and these tertiary grooves lie in a manner parallel to the primary groove. A feather is formed on such a papilla much in the same manner as fluid metal is shaped in a mould. Horny matter secreted by the skin is pushed over the papilla, and naturally becomes thickest where the grooves are deepest. Thus, as the horny matter is pushed outwards, the material deposited in the central and primary groove becomes the *quill* or *shaft;* the matter deposited in the secondary grooves forms the *barbs*, which together compose the *web;* and the horny substance contained in the tertiary grooves forms the little *barbules*, or processes borne on the *barbs*, which bind the latter together to form the *vane* or *web*. These are the parts seen in any ordinary feather. The quill or barrel of the feather is its last-formed portion, and that by means of which it is inserted in the skin of the bird. The lower surface of the shaft exhibits a groove, the shaft itself consisting of a spongy white pith enclosed in a tough membrane. At the lower aspect of the shaft the barbs of the F. are disconnected, and form downy filaments; *down* itself, well seen in the under layer of F., especially in aquatic birds, consisting of a number of barbs, without any central shaft, united by a short quill. A small or miniature feather, often termed the *rachis, accessory plume*, or *plumule*, exists at the point where the quill and shaft unite. In some birds the rachis may be as large or larger than the feather itself, and in such birds as the ostriches, emus, and their allies, the barbs of the F. are not united to form a web, but are disconnected and free. It is this peculiarity of structure which gives to the ostrich F. their singular grace. In the cassowaries and other birds, the texture and appearance of the F. become singularly altered, and give to these birds the appearance of being clothed with long black hair.

The F. of birds receive various names, according to their situation. Those attached to the bones of the 'hand' are named *primaries;* the *secondaries* are attached to the forearm, and the *tertiaries* to the arm. The F. attached to the shoulder-blade are the *scapularies.* The *bastard wing* or *alula* is the name given to the collection of F. supported by the rudimentary *thumb*. The quills of the wings are covered at their bases by small F. forming the *wing-coverts*, the tail F. or *rectrices* being similarly protected by *tail-coverts.* F. once fully formed do not *grow.* They are mere appendages, and are therefore mostly renewed by new F. being developed, and by the moulting of the previously formed plumage. Changes of colour are observed in F., due probably to chemical action.

F. are applied to many useful and ornamental purposes, especially those of the ostrich, the rhea or American ostrich, emu, birds of the heron kind, adjutant and Marabou stork, birds of paradise, argus pheasant, and many other common birds. The plumage of the male ostrich is most esteemed, that from the back and above the wings being preferred to that of the wings and tail. These F. adorn ladies' bonnets, and form military plumes, &c. Other ornamental F. are chiefly devoted to the preparation of ladies' head-dresses, artificial flowers, wreaths, fans, ornamental screens, &c. The soft F. and light elastic down procured from swans, geese, ducks, and fowls, are extensively used for stuffing beds, cushions, &c. France supplies Great Britain with large quantities of goose and duck produce, and smaller quantities are obtained from Germany and Holland. Goose F. are most appreciated for their softness and elasticity. The down of the eider-duck is much valued for quilts on account of its warmth and softness, but its matting character when lain upon keeps it from being much used for stuffing beds. Articles of clothing are made in different countries of birds' skins.

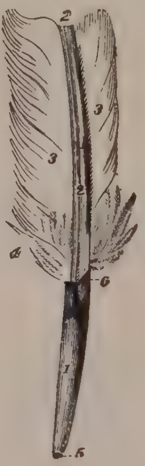


Fig. 1.—Parts of a Feather.

1, Quill; 2, Shaft; 3, 3, Vane or Beard; 4, Accessory Plume; 5, Lower Umbilicus; 6, Upper Umbilicus.

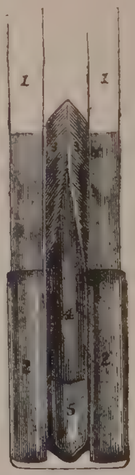

Fig. 2.—Matrix of a growing Feather laid open.

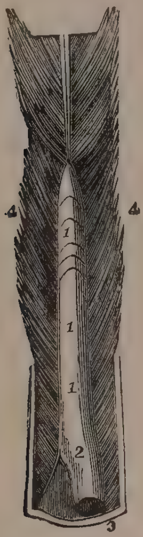
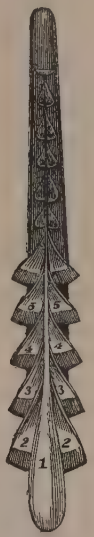
1, 1, Capsule of matrix; 2, 2, External membrane; 3, 3, Matter of the vane; 4, Internal membrane; 5, Bulb or medulla.

Brazilian tribes make garments of the rich and varied plumage of native birds, and the Greenlanders wear the skins of waterfowl, turning the F. to the inside. Tippets, muffs, and many other articles used by ladies are likewise made of F. A special fabric, composed of upper and lower layers of wool, and a thick intermediate one of down, the whole being carded together, is now manufactured in France for use as ladies' cloaks and other apparel. Spinning is performed by hand, and the wool-down is woven in the ordinary way with a warp of worsted.





Structure of the Bulb.

Fig. 3.

Fig. 4.

1, Medulla or bulb; 2, 2, 3, 3, 4, 4, 5, 5, Membranous cones, indicating stages of growth of medullary matter.

Quill-pens are made from the hollow tubes of swan, goose, and crow feathers. The quills of the Solon goose are used as floats for rod-fishing. In many parts of the world quills are employed for making ornamental baskets, cigar-cases, &c. Goose quills dyed various colours are made into ornamental articles by the Slave Indians of N. America, and in the East peacocks' quills are similarly used. The following table affords information concerning the importation of F. into the United Kingdom. It would appear that Germany, France, China, and the U.S. of America are our chief suppliers of F. and down for beds, and that we obtain ornamental F. principally from the Cape of Good Hope, France, Holland, Bombay, U.S. of America, and Bengal.

Feather Star, a species of *Crinoid* (q.v.) *Echinodermata* (q.v.), which in its earlier stages exists in a stalked condition, but in the adult state is met with as a free starfish form. The F. S. derives its name from its ten arms or rays being provided with numerous little *pinnæ* or processes, which give the arms a feathered appearance. The F. S. was formerly included in the order *Asteroidea* with ordinary starfishes, its early history being then unknown to naturalists. When first discovered in its young and attached state, it was thought to be a new form of *crinoid*, and as such was named *Pentacrinus Europæus*. But when this new crinoid was observed throughout its entire history, the star-like head was seen to detach itself from its stalk, and afterwards (as the F. S.) to live a free existence. The discovery of its early and attached condition at once showed that the F. S. was a true crinoid, and not an ordinary starfish, which is free and unattached throughout its entire existence. The arms are used by the F. S. as locomotive organs; and the internal organs are confined to the central body or *disk*, and do not, as in ordinary starfishes, send prolongations into the rays. The young or larva of the F. S. is an ovoid creature with four ciliated and transverse bands, and a small mouth and end. The young F. S. is developed within this primitive embryo. The F. S. is widely distributed; it occurs in certain localities on the British coasts.

Febric'ula (Lat. 'a little fever') is a fever of short duration and mild character. The simplest form is Ephemera (q.v.), but the more severe, called *simple continued fever*, may last seventy-two or more hours. See FEVER.

Feb'rifuge (Lat. *febris*, 'a fever,' and *fugo*, 'I drive away'), a medicine having the property of curing a fever, such as mineral and vegetable acids, potassæ chloras, P. citras, P. nitras, &c.

Febro'nianism is a development or a phase of Jansenism (q.v.) which made its appearance in the Roman Catholic Church in Germany towards the end of last century. Among other things F. asserted the independence of national churches. It was so called after Justinus Febronius, the *nom de plume* adopted by J. H. von Hontheim in his work *On the State of the Church and the Legitimate Authority of the Roman Pontiff* (1767).

Feb'ruary, the second month of the year, was, along with January, introduced into the Roman calendar by Numa Pompilius, who allotted twenty-nine days to it, except in leap years, when it had thirty. Augustus, however, transferred one day from F. to the month named in his honour, that it might be inferior to no other month of the year. The name F. is derived from *Februare*, 'to purify,' because on the 15th of F. the *Februa* or *Lupercalia*, the Roman festivals of lustration and expiation, were held. Some consider (from the coincidence of the time of year) that the Christian festival of the Purification of the Virgin on Candlemas Day was engrafted upon the Roman rite.

Feb'ruus (Lat. *februa*, 'purifications,' a word of Sabine, or according to others of Etruscan, origin), an ancient Italian divinity in whose honour lustrations were celebrated on the 15th of February, which thus took its name from him. As these were supposed to produce fertility among men and beasts, Juno likewise, as the goddess of marriage, was designated Februata. F. was sometimes identified with the god of the infernal world (*Hades*), because the festival for the dead (*Feralia*) was also celebrated in February.

Fécamp, earlier **Fescan** or **Fescamp** (Lat. *Fiscanium* or *Fiscarium*), a seaport of Seine Inférieure, France, on the English Channel, 23 miles N.N.E. of Le Havre. The most interesting building is the church of Notre Dame, a fine specimen of the 14th c. Gothic, in which the wood-carvings in the choir and lady-chapel are extremely delicate and beautiful. F. has shipbuilding yards, forges, cotton, saw, oil, and bark mills, and breweries. Its sea-baths are famous. Here boats are fitted and employed in the herring, mackerel, and cod fisheries. Pop. of commune 13,577.

Fech'ner's Psycho-Physical Law. This is as follows:—'Sensations increase proportionately to the logarithms of the strength of the stimulus.' See SENSORY IMPRESSIONS.

Fech'ter, Charles Albert, an actor of considerable originality and brilliance of style, was born in London, 23rd October, 1824. His father was a German, his mother an Englishwoman, while he himself by education was practically a Frenchman. He first appeared on the Paris stage, and afterwards joining a company, travelled through Italy, played in Berlin in 1846, and in Paris and London in 1847. Returning to Paris, he made the part of Duval in the *Dame aux Camélias*, and earned a reputation which never afterwards declined. In 1860 he appeared at the Princess's in *Ruy Blas*, and at once took a high position on the London stage. His Hamlet (20th March, 1861) created great interest, and was the topic of much discussion. Originality of conception and rejection of stage traditions were the chief characteristics of F.'s Hamlet, and constitute it, perhaps, the first of what may be called the 'new light' interpretations of Shakespeare, of which we have had several since. In 1863 he became lessee of the Lyceum Theatre, in which he produced *The Duke's Motto*, *Bel Demonio*, &c. In America, to which he removed in 1870, he achieved a brilliant success. After making the tour of the principal cities of the States, he was for some time lessee of the Globe Theatre, Boston. He died in 1879.

Fecia'les, an order of priests among the Romans appointed to proclaim war and to negotiate peace. The *jus feciale* was the only principle recognised by the Romans corresponding to modern international law.

Fec'ula, or **Fæc'ula** (Lat. dim. of *fæx*, 'sediment,' Fr. *fécule*), organic matter obtained as a sediment after macerating the cellular tissue of plants with water. F. is frequently employed as a synonym for Starch (q.v.).

Fedchenko, Alexel, a distinguished naturalist, of Russian parentage, born about 1830. He lived principally at Moscow while not on his travels. Being desirous of comparing the glaciers of the Alps with those on the mountains of Khokan, which he had visited, he set out from Chamouni to climb the *Col du Géant*, but was overwhelmed in a snowstorm and perished from exhaustion. He left behind important notes which had been composed by himself and his wife, who usually accompanied him on his journeys, though on this last occasion he left her behind him.

Fed'eral Gov'ernment, in the historical sense, has been said to exist whereever the bond of union between the members is closer than that of alliance, and the degree of independence possessed by the members is greater than that of municipal freedom. In the ideal federation each of the members ought to be wholly independent in those matters (*e.g.*, criminal and constitutional law) which concern itself; while the union itself is absolutely sovereign on all matters affecting all the members, being chiefly external matters of international law, questions of peace and war, diplomatic intercourse, &c. There are four great examples—the Achaian League (B.C. 281-146); the Swiss cantons, converted in 1847 from a *Staaten-bund* into a *Bunde-staat;* the Seven United Provinces of the Netherlands (A.D. 1579-1795); the United States of America (A.D. 1778). The minor confederations of ancient Greece, such as the Phokian, the Akarnanian, and the Epeirot Leagues in the N.; the Bœotian League; and in modern times the German Confederation (1815-66), followed by the North German Confederation, are much less developed specimens of union. Of the old leagues of the thirty cities of Latium, and of other cities in ancient Italy, history relates nothing certain. The league of the Hanse towns, though now of a special and restricted kind, is perhaps the oldest modern form of political union; the youngest and least promising are among the republics of S. America. The change mentioned above in the Swiss constitution indicates the fundamental distinction between the 'system of confederated states' and the 'composite state.' In the latter the federal government acts directly on all organic questions on the subjects of every state who are truly also its own subjects. In the former it must act by the intervention of the state governments. This was tried for the first few years of American independence, but emphatically repudiated by the great leaders, Hamilton, Jay, and Madison, who wrote the *Federalist* in support of the composite state. The older principle again appeared in the German *Bund*, which was not able even to maintain an alliance in peace and war. It had no executive power, and the arrangements as to currency and customs were really the work of Prussia. Mill has stated three conditions of useful federation—(1) a certain degree of mutual sympathy arising from common race, language, religion, political institutions; (2) that none of the members be sufficiently powerful to lose nothing by standing alone; (3) that there be no great inequality among the members. Even in the most successful federations it has been a delicate matter to preserve the balance of power between the federal government and the states. In the United States, questions on the constitution have frequently been decided in a peaceful way by the supreme court of justice; but the institution of slavery, being one naturally repugnant to civilised feeling, with its attendant questions of free soil, fugitive-slave law, &c., for a long time threatened, and at last nearly broke the Union. The American plan of a double chamber, one of which elected by a mass vote represents population, and the other elected by the legislatures of the states gives an equal representation to the states, seems wise and successful. It is always a question of circumstances whether federalism is better than an undivided government. The extent of territory, the commercial interests, the history of the inhabitants, must all be taken into account; and it must be remembered that such local autonomy, extending even to different systems of law and religion, may exist under a central monarchy. Generally, however, some great enthusiasm of race, the remembrance of a common history, devotion to a great family, or a political or religious principle, will be required to weld into unity the elements of difference. It has been suggested by Freeman that federalism combines to a certain extent the advantages of large states (viz., peace and the diminution of local prejudices and party strifes) with those of small states, of which the chief are a higher political intelligence and freedom from corruption.

Fee and Liferent. The first is the right of proprietorship, the second is the right to the use and profits of the subject during life. The rights may be held by one person, or they may coexist in different persons. In Scotland it is usually applicable to heritable property, though there may be liferent upon household furniture, which wears out, or on farm-stock, which dies. In such cases the life-renter must leave the stock, &c., at the close substantially of the same description, value, and extent as when he entered. The interest of money may be due to a life-renter but seldom any bonus. The person whose property is the subject of the liferent is called the *Fiar*. There are two sorts of liferent: *conventional*, which is simple or by reservation; *legal*, which is terce, or third of heritable subject, due to widow and wife who has divorced her husband, and *courtesy*, or liferent given by law to surviving husband of all wife's heritage when a child of the marriage has been born alive and has been heard to cry.

Fee-Simple. In England, a tenant in F.-S. is one who has unconditional and freehold possession of a property. He can dispose of his estate by sale, gift, or will. F.-S. is the largest interest that can be held in real property. To create it the conveyance must be to the grantee *and his heirs*, except in a will, in which equivalent expressions are admitted. The estate is subject to escheat on there being no heirs of the deceased intestate owner. The term is used in contradistinction to that of fee-tail, which is a limited tenure. See ENTAIL.

Fees in English Law Courts. All fees in courts of justice allowed by Act of Parliament are established fees, and the officers entitled to them may enforce their claim by law. Under the Supreme Court of Judicature (1875) Act, the Lord Chancellor, with the advice and consent of the judges of the supreme court, or any three of them, with concurrence of the Treasury, may fix the fees and percentages to be taken in the High Court of Justice or in the Court of Appeal, or in any court or office connected with these. The fees are to be taken in stamps, to counterfeit which is forgery, rendering the criminal liable to penal servitude.

Fees, Professional. In England it has been conclusively decided in the case of Kennedy *v.* Swinfen, that a barrister has no valid ground of action for his fees, which are given as a gratuity, not as hire; but a client cannot by law recover a fee paid to counsel, not even if he fail to attend the cause for which he has received the fee. In Scotland it is considered that an advocate has no legal claim for a professional fee. By 21 & 22 Vict. c. 90, which applies to the United Kingdom, physicians, surgeons, and apothecaries are now entitled to recover reasonable charges, with costs of medicines and medical appliances, in any law-court. The general rule of law is that a member of any recognised profession has a legal claim for fees according to custom, if the custom be reasonable, for an unreasonable or unjust custom will not be upheld by law. See RETAINER.

Fehérvár Székes (Ger. *Stuhlweissenburg*), a royal free town, and capital of a county of the same name, lies near the swamp Sár-Rét, 37 miles S.W. of Pesth by railway. Till 1527 it was the place of coronation and burial of the Hungarian kings. The seat of a bishop, F. has a cathedral, a bishop's palace, the beautiful Johanniskirche (1752), several higher schools, and a Hungarian theatre. Its manufactures are woollens, flannel, patent leather, soap, and cutlery. There are artesian wells. F. occupies the site of the Roman *Floriana*. It suffered in the early wars with Austria, and fell in 1543, and again in 1602, into the hands of the Turks, who held it till 1688. Pop. 27,548.

Feign'ed Iss'ue, in English law, was an action feigned to be brought with consent of parties to determine a question without pleading, so as to save time and costs.

Feign'ing of Disease' is of common occurrence in the army and navy, and amongst convicts and others desirous of escaping from discipline or avoiding compulsory service. In such cases it is technically called *malingering*. The diseases most commonly simulated are epilepsy, blindness, deafness, paralysis, insanity, neuralgia, and rheumatism causing lameness, &c. F. of D. is frequently practised by begging impostors, and in very many cases solely for the purpose of exciting sympathy and procuring notoriety. Detection, although difficult, is generally effected by very simple means, and by not any more quickly or more surely than by the unexpected application of electricity to the impostor. A little dry Scotch snuff, blown through a quill up the nostrils of a feigning epileptic, excites a fit of sneezing which may continue for an hour. When practised for a length of time, F. of D. often becomes a monomania, resulting in real mental disease, and cases are on record in which amputations have been submitted to for the removal of diseased parts, artifically produced. Feigning lunatics often become really insane.

Feint (Fr. *feindre*, 'to feign,' from the Lat. *fingere*), in warfare, is a seemingly offensive movement, usually made with the view of withdrawing the attention of the enemy from a position against which the real attack is to be made.

Feith, Rhijnvis, an eminent Dutch poet, born 7th February, 1753, at Zwoll, in Oberyssel. He studied at Leyden, became burgomaster of Zwoll, won considerable fame as a poet, was chosen member of the Institute of the Low Countries, and died in his birthplace, 8th February, 1824. His chief productions are *The Grave* (Amst. 1792); a didactic poem, *Old Age* (Amst. 1802); *Odes and Miscellaneous Poems* (1796-1810); *Thirza* (1791), and *Ines de Castro* (1793), tragedies; and *De Geuzen*, a patriotic lay on the water-beggars. A collection of his works appeared at Rotterdam (1824).

Feld'mann, Leopold, a German author of Jewish family and faith, was born at Munich, 22nd May, 1803. He first showed his poetical powers, according to common report, when a boy of thirteen and a cobbler's apprentice, by sending in a lady's pair of shoes, which he had mended, verses expressing his admiration of their owner. At the age of fourteen he produced a play, *Der Falsche Eid*. After spending a few years in trade, he was persuaded by Saphia, the poet, to throw himself into literature. His career as a man of letters was eminently successful. The foundation of his fame was his comedy, *Der Sohn auf Reisen* (1841). In 1850 he was appointed histrionic teacher (*dramaturg*) at the National Theatre of Vienna. F.'s comedies, which are marked by spontaneity and sprightliness, have been published under the title *Deutsche Originallustspiele*.

Felegyha'za, a market-town of Lesser Cumania, Hungary, on the railway between Pesth and Temesvar, 15 miles S.S.E. of Kecskemét, produces wine, fruit, and tobacco, and has cattle markets. Several Roman remains have been discovered in the neighbourhood. Pop. 30,326.

Feli'cians, the adherents of Felix, Bishop of Urgelles, in the Adoption Controversy (q.v.).

Fel'idæ or **Fe'line Animals,** a large family of Carnivorous mammalia, represented by the typical genus *Felis* and its varieties. It includes the lion, tiger, lynx, leopard, panther, cat, and other such animals. The F. are *digitigrade Carnivora*, that is, they walk on the tips of their toes. The soles of the feet are hairy, and the metacarpus and heel are raised from the ground. The jaws are usually short, and the muscles of a great size and strength. The molar and præmolar teeth exist in fewer numbers than in any other *Carnivora*. They possess cutting edges, except the last upper molar, which is tuberculate, or provided with blunted points. The upper 'flesh' tooth (the last tooth but one in the upper jaw, and the last tooth in the lower jaw are named 'flesh teeth') in the F., has three lobes or divisions, and a blunt internal process. The lower flesh tooth has two cutting lobes. The typical arrangement of the teeth in F. is six incisors, and two canines in each jaw; six præmolars in the upper, and four in the lower jaw; and two molars in each jaw—making a total of thirty teeth. The legs are usually of equal size, and there are four toes on the hind, and five on the front feet. The toes are provided with retractile claws, which can be withdrawn at will within sheaths—an arrangement exemplified in the common cat. The tongue of the F. is rough, and its papillæ are horny; this structure fitting it to serve as a rasp in scraping the flesh from the bones of the prey. The muscular system is well developed, the bones having prominent ridges for the attachment of muscles. The F. are very generally distributed throughout the world, but attain their greatest size in tropical regions. They approach their prey stealthily, and generally spring or bound upon it from a distance. It is doubtful if any other genus than the single genus *Felis* can with good reason be classed in this family. Many varieties of its included forms exist, but these can hardly be regarded as distinct species.

Fe'lix, the Roman procurator of Judea in the reigns of Claudius and Nero, to whom St. Paul was consigned by the chief captain at Jerusalem when his life was in danger from the Jews (Acts xxiii.). Originally a slave, he was manumitted by Claudius Cæsar, from whom he took the prænomen Claudius. He had also the surname Antonius, after Antonia, the emperor's mother. He was loaded with military honours by the emperor, and finally made procurator of Judea, in which position he indulged in all kinds of cruelty, relying on his influence at court to shield him from punishment for any crime he might commit. Superseded in 62 by Porcius Festus, he was accused by the Jews, and only escaped punishment through the influence of his brother Pallas with Nero.

Popes.—**Felix I.** (about 269-274), gained an adventitious importance owing to the following circumstance. Paul of Samosata (q.v.), Bishop of Antioch, after being deposed for heresy by the Council of Antioch (269), kept possession of the Church property. The Emperor Aurelius was appealed to by the orthodox party to compel Paul to resign his office. The emperor decided that he should be bishop who was recognised as such by F., the Bishop of Rome. F. is said to have perished in the persecution under Aurelius, about 274. —**Felix II.** was an archdeacon who acceded to the wishes of the Emperor Constantius when, in 356, he banished Bishop Liberius (q.v.) because he would not agree to the condemnation of Athanasius, and was elevated to the place of Liberius. After Liberius was restored F. was banished, and is said to have spent the rest of his life in penance for his declension to Arianism.—**Felix III.** succeeded Simplicius in 483. The Emperor Zeno had (482) put forth a formula of concord, called *Henoticon*, intended to settle the dissensions caused by the Monophysite controversy. This Henoticon, for its concessions to the Monophysites (q.v.) was rejected by F., who also attacked Acacius, Bishop of Constantinople, by whose advice Zeno had acted, and got him deposed in a council of seventy bishops held at Rome (484). Acacius was supported by the emperor and the Eastern bishops, and thus arose the first schism between the Eastern and Western Churches, which lasted thirty-four years. F. died 492.—**Felix IV.** (526-530) was raised to the papacy by Theodoric, in opposition to the wishes of the senate aud the people.—**Felix V.,** who became pope in 1439, was Amadeus VIII., Duke of Savoy, being elected by the fathers at Basel, who had deposed Eugenius IV. But as the majority of the Church adhered to Eugenius, there were two popes, and also two councils, the one sitting at Basel, the other at Constance. F. resigned his high dignity in 1449, leaving the undivided papacy to Nicolaus V., who had meantime succeeded to Eugenius.

Fell'ah (Arab. 'a peasant;' plural *Fellahin*), the name of the agricultural labourer in Egypt, or of the peasant in contemptuous contradistinction to the inhabitant of the towns. Fellahin are the descendants of the ancient Egyptians, and form some three-fourths of the inhabitants. In the 7th c. they were forced to accept the religion and language of the Arabs, and the long period of their degrading toil and miserable subject condition has permanently influenced their character, habits, and appearance. They are from 5 to 6 feet in height, muscular and active, with an oval skull and a broad round face, a low retreating forehead, long deep-set eyes, large mouth, thick lips, and excellent teeth. The hands and feet, however, are of small size. A grinding system of taxation has lowered, if not broken, the spirit of the F., yet he is a brave, hardy soldier. Like the Egyptian of old, he is of grave, sustained temperament, and is distinguished equally for intelligence and immorality, sobriety and indolence. The women, who tattoo, marry often before eleven years of age. The Fellahin villages are for the most part disorderly clusters of filthy huts, surrounding a mud-built mosque. Under British direction the condition of the F. has greatly improved. It is estimated that in Lower Egypt there are 2359 villages, representing 2,800,000 acres of cultivated land, and in Upper Egypt there are 1420 villages, representing 2,300,000 acres of cultivated land. Upon this land 342,309 date-trees and 64,493 fruit-trees are grown, and 99,220 sheep and goats and 69,454 farm animals are reared and employed. Over 2500 villages are engaged in the cultivation of cotton, with an annual yield of some 4980 millions of lbs. The export is valued at £E8½ millions for raw cotton, and at £E1¾ millions for cotton-seed. Besides cotton, the country yields sugar, rice, onions, wheat, beans, lentils, &c., and the value of the export is estimated at £E12¾ millions.

Fellata' (also called by the various tribes Fula, Fellani, Fulbe, &c.), the most intelligent of all the African races, now occupies a wide area in the W. of the Sudan, and includes many powerful states, as Flausse, Futa-Jallon, Senegal-Futa, Massina, &c., between 7° E. long.—12° W. long., and 19°—12° N. lat. The F. advanced from Senegal in an easterly direction, and already in the 16th c. had spread beyond the Niger, and comprised several large tribes. It was only, however, in the beginning of the 19th c. that they were stirred to conquest and to the spread of the Mohammedan religion by the Imam and reformer, Othman of Benue, on whose death (1816) the F. territory had increased to an area of 327,146 sq. miles. The people, who are of a reddish colour, and of great variety of type, are industrious and clever, but they are oppressed by a grasping aristocracy. The pop. is estimated at about 7,000,000.

Fell'enberg, Philip Emanuel von, a great improver of Swiss agriculture and education, was born of good family at Bern, 27th June, 1771. After studying law at Tübingen, and travelling in different European countries, he finally devoted himself to a career of philanthropy. Purchasing the estate of Hofwyl, near his native city, he commenced a series of efforts to increase the productivity of the soil, and also to better the condition of the peasantry. He founded an asylum for forsaken children, a school of theoretical and practical agriculture, and in connection with it an institution for the education of the higher classes, which became quite famous and the model of similar institutions in other lands. F. died 21st November, 1844. See Hamm, *F.'s Leben und Wirken* (Bern 1845).

Fellows, Sir Charles, was born in August, 1799, at Nottingham, where his father was a banker. From an early age F. took a delight in travelling, and made himself familiar with Scotland, Switzerland, Italy, Greece, and Asia Minor, when, according to popular belief, the statement of Colonel Leake, that the valley of the Xanthus had never been explored, led him to make it the centre of archæological investigations, which he prosecuted with but slight intermissions to the end of his life. Lycia was explored by him in three different journeys in 1838, 1839, and 1841-42, the results of which were the discovery of the ruins of fifteen ancient cities, including Tlos and Xanthus, the original capital of Lycia, and the bringing home to England a great number of works of art from these cities, including twenty cases of marbles and casts, now in the British Museum. F., who was knighted in 1845, died 8th November, 1860. For a description of his investigations see his published works, *The Xanthian Marbles* (1843); *An Account of the Ionic Trophy Monument Excavated at Xanthus* (1848); *Travels and Researches in Asia Minor, particularly in the Province of Lycia* (1852), containing journals formerly published by him; and *Coins of Ancient Lycia before the Reign of Alexander* (1855).

Fell'owship, the name applied, almost universally, to the holders of the larger endowed posts in the colleges of Oxford and Cambridge, being a translation of the 'socius' of the original statutes. The number varies in the different colleges, and there are several other minor differences, most of which have been created within the past few years. The following is an outline of the general system. Candidates must have qualified for the degree of B.A., and the selection is determined by an open examination. The post brings with it an equal vote in the government of the college, but involves no specific duties, and has no place in the life of the university proper. As a rule, it was tenable for life, subject only to the conditions of celibacy and the absence of a specified income from other permanent sources. Now it is more commonly for a term of years, or during the continuance of a certain occupation in connection with the college to which it belongs. The restrictions on marriage is relaxed, and religious disqualifications are more the exception than the rule at the universities.

Fe'lo de Se, a verdict in English law by which it is declared that one who has committed suicide has done so in sound mind, and has thereby become a felon. Formerly the punishment was ignominious burial in the highway with a stake driven through the body. As the ignominy, however, could only be felt by innocent survivors the penalty was mitigated by 4 Geo. IV. c. 32. By the Interments Act (Felo de Se), 1882 (45 & 46 Vict. c. 19), interments of suicides may now be made in any of the ways authorised by the Burials Act, 1880, and with a religious service, on the ordinary granting permission, though not of course with that of the Prayer Book, which is expressly forbidden to be used on such occasions. An attempt to commit suicide is a misdemeanour. The meaning of F. de S. is *a felon with respect to himself*.

Fe'lony (the word *fello*, 'a felon,' is found in the Capitularies of Karl the Bald, but its origin is unknown), a term of English law denoting the more serious offences. The chief distinction between F. and *misdemeanour* used to be that the former occasioned the forfeiture of lands or goods, or both, at common law. This distinction has been done away with by 33 & 34 Vict. c. 23, which abolishes forfeiture for felony. The chief distinctions that now exist are: a person convicted of felony has a right to be heard before the judge pronounces judgment; the jury that tries him may not separate till they have given their verdict; the person charged must plead personally; and concealment of felony is a crime in any person other than the felon. A conviction for F. is a disqualification for certain offices.

Fel'spar (Ger. *feldspath*, 'field-spar'), a family of minerals, the most important of all in the structure of rocks. It is divided into two groups according to the crystallization:—(1) *Orthoclase* (Gr. 'straight-cleavage') or monoclinic F.; (2) *Plagioclase* (Gr. 'oblique-cleavage') or triclinic F. The former group, comprehending the so-called *potash* felspars, comprises the varieties adularia, rhyacolite, sanidin, orthoclase, and loxoclase, which are composed of silica, alumina, potash, and soda, in varying proportions; are coloured white, grey, or flesh-red, with sometimes greenish and bluish tints; have a vitreous lustre, and are transparent to subtranslucent. F. is taken as one of the standards of the scale of hardness, being degree 6. *Moonstone* and *sunstone*, often set in jewellery, are opalescent varieties of adularia, the latter containing minute scales of mica. The members of the second group contain lime instead of potash, and are termed *soda* or *lime* felspars, according as soda or lime predominates. Of the soda felspars albite and oligoclase are the chief varieties, having usually a white colour, a pearly or vitreous lustre, with physical and optical properties similar to the other felspars. The type of the lime felspars is labradorite, which varies in colour from dark grey to brown, frequently relieved by the play of rich delicate tints due to internal reflections. The felspars form the basis of all true igneous rocks, the *orthoclase* varieties occurring in granite, felstone, pitchstone, obsidian, syenite, orthoclase porphyry, trachyte, and phonolyte; and the *plagioclase* varieties in porphyrite, diorite, basalt, dolerite, andesite, diallage rock, and also granite. Plagioclase granite is distinguishable from orthoclase by its usually lighter colour. Grains of F. frequently occur in sandstones, which are named the *felspathic* sandstones, in distinction to the *micaceous*, *quartzose*, and *argillaceous* sandstones. *Kaolin* (q.v.) results from the decomposition of F.—the potash and part of the silica being removed and water added.

Fel'stone, the name given by Sedgwick to a class of igneous rocks, otherwise known as petrosilex, felsite, felsite porphyry, &c., is composed of orthoclase intimately mixed with quartz. It is smooth, compact, and flinty-like, varies in colour from dark-grey to white, and has a smooth fracture.

Felt (Ger. *filz*, 'woollen cloth,' allied to the Lat. *pileus*, 'a felt hat or cap') is a kind of cloth or texture made without any process of spinning and weaving, by matting together or interlacing fibrous substances. The property of felting which is possessed by certain fibres is due to the jagged or notched character of their surfaces, which enables them by the application of pressure, combined with a certain amount of moisture, to adhere firmly and closely together, so that if the moisture and pressure are applied to a lap, or evenly spread-out layer, a uniform compact cloth may be produced. A certain amount of felting power must be possessed by all fibres in order that they may adhere sufficiently to enable them to be spun, but it is only wool and certain other animal fibres that are capable of being used for F. Examples of the felting property are found in the matting which takes place in mattresses and cushions filled with woollen flocks, and in the shrinking of flannels and woollen fabrics by washing. Woollen cloths in addition to the process of weaving receive a certain amount of felting in their finish. The property of felting is chiefly turned to account in the manufacture of F. hats (see HAT MANUFACTURE), for which, in addition to wool, the hair of the rabbit, hare, nutria, musquash, and various other mammals is employed.

The import of felt hats into the United Kingdom during the year 1894 was as follows:—

	Number.	Value £.
From Holland	14,350	2,119
,, Belgium	346,019	46,793
,, France	71,506	14,993
,, Other Foreign Countries .	6,906	1,008
Total from Foreign Countries .	438,781	64,913
From Canada	192	17
Total	438,973	64,930

Felted cloth is very extensively employed for making table-covers, crumbcloths, and cheap carpetings, which generally are ornamented with printed patterns, and sometimes in the case of tablecovers embossed. The Persians make a felted carpet in which a pattern is produced by inlaying the various colours in the substance. A heavy coarse kind of F. is very extensively used by the Russian peasantry for their winter garments, and for boots and shoes, which are moulded in a single piece. F. prepared with artificial asphalt is employed for roofing buildings.

Fel'ton, Cornelius Conway, LL.D., a distinguished American scholar, was born at West Newbury, Massachusetts, U.S., 6th November, 1807. He graduated at Harvard in 1827. In 1832 he became Professor of Greek in Harvard, and in 1860 President of the College. In 1853 and 1858 he visited Europe, and wrote his *Familiar Letters from Europe* (published in 1865). He died 26th February, 1862. F.'s chief works are—*Homer* with English notes (1833), a translation of Menzel's *Deutsche Literatur* (3 vols. 1840), *Panegyricus* of Isocrates (1849), *Birds* of Aristophanes (1852). Along with Sears and Edwards he published *Ancient Art and Literature* (1843). His most important work, *Greece, Ancient and Modern*, published in 1867, was compiled principally from his lectures before the Lowell Institute at Boston.

Fel'tre (Ger. *Felters*), an old town in the province of Belluno, N. Italy, on a height overlooking the Piave, 50 miles N.N.W. of Venice. It has a cathedral, considerable manufactures of silk-twist, some trade in wine, oil, and grain, and extensive bleachfields. Pop. 12,947.

Felucc'a (Ital., from Arab. *fulk*, 'a ship'), a small vessel used in the Mediterranean, rigged with lateen sails, but propelled also by oars when required.

Female Whipp'ing was abolished as a penalty by 1 Geo. IV. c. 57, imprisonment or solitary confinement being substituted.

Feme Coverte′ is the English law term for a married woman. At Common Law a husband and his wife were treated as one person in most cases, and all the property of the wife passed to her husband for his absolute use, while the latter could not make a grant to his wife except under the Statute of Uses, or by making a trust, or by surrendering copyhold to her use, or by will, or by local custom. The Married Women's Property Acts have changed all this, and now there is scarcely any difference in respect of property between the position of the unmarried and that of the married woman. On the other hand, the husband is relieved of the responsibility of paying the debts incurred by a F. C. and of fulfilling the contracts entered into by her when his authority has been neither expressed or implied. The husband and the F. C. may, however, be jointly sued for debts incurred by the latter before marriage, and the former is liable for them to the extent of the property he may have obtained by his wife.

Fem′ern, or **Feh′mern** ('the place of cattle'), an island in the Baltic belonging formerly to Denmark but now to Germany, separated from the N.E. point of Holstein by a narrow shallow channel, the Femersund. It is 16 miles long by 12 broad, is low and marshy, but fertile, producing much wheat and barley, which are largely exported. The fisheries are also valuable. The chief places are Burg and Petersdorf. Pop. 1014.

Feme Sole is the English law term for an unmarried woman. A married woman who by the *custom of London* traded on her own account without the husband being liable for her dealings was called a F.S. trader, because with respect to her trading her position was the same as that of a single woman. The *custom of London* is the general law of France, where any married woman can hold property irrespective of her husband and his creditors.

Fem′gerichté, or **Fæm′gerichté** (Old Ger. *fem*, 'punishment,' and *gericht*, 'a court of justice'), secret tribunals which arose during the Middle Ages in Westphalia, and took the place of the regular courts of justice. They seem to have grown out of the open-air meetings held by the German tribes in very early times, the notion that they took their origin from the courts held by the Missi Dominici, or imperial legates appointed by Karl the Great, being probably erroneous. Little is known of them before the end of the 12th c., when, on the deposition of the Emperor Heinrich the Lion (1180) and consequent removal of legal restraints, they were organized as a curb on feudal tyranny. They were centred in Westphalia, which was known among their members as the *Red Land*, but their influence was soon felt throughout Germany, and seems at first to have been a potent check on crime. They gradually, however, became a gigantic evil, wielding a terrible power, enhanced by the gloomy mystery which veiled them, and enforcing a system of irresponsible terrorism. Though at first the emperors made them occasional instruments of imperial designs, they grew strong enough to defy the civil government, and even on one occasion summoned the emperor to appear before them. The Pact of Westphalia in 1371 declared them lawful institutions, and during the 14th and 15th centuries their power rose to its height. In 1438 the Emperor Albrecht II. strove to abolish them; and in the second half of the 15th c. so flagrant were their evils, that in 1461 a league was formed against them by the Swiss commonwealth and several German cities and princes. In 1495 Maximilian I. made them accept a new code, which greatly weakened their authority; and on the *Landfriede* or general peace being established through Germany, and the administration of public justice secured, their influence rapidly waned, the last public F. being held at Celle, Hanover, in 1568. The secret meetings lingered on in Westphalia, though shorn of real power, until 1811, when they were suppressed by Jerome Bonaparte. The procedure at the secret meetings is somewhat obscure. The president of a court was called a *Freigraf* ('free-count'), while the members of the brotherhood who carried out his sentences were named *Freischöffen* ('free-justices'), or *Scabini*. These *Freischöffen*, who at one time are said to have numbered 100,000, were also styled *Wissenden* ('wise' or 'initiated men'). At first none save a free Westphalian could be admitted into the brotherhood, but afterwards men from other districts were enrolled. They were sworn to secrecy by a terrible oath, and recognised each other by various signs, the chief of which was the mysterious S.S.G.G., whose meaning has never been revealed. The Freischöffen were bound to disclose any crime against 'the holy Fem,' or they were liable to the punishment due to the offence they had concealed. A man accused by one of the brotherhood was thrice summoned to appear by a citation secretly affixed to his door; and if he did not answer the command, was again called upon in a secret meeting named the *acht*, when, if he still disobeyed, the first Freischoff who met him was empowered to bind him to a tree, or, if he resisted, to slay him at once, in either case leaving the dagger borne by each of the members to show who had done the deed. The emperor was nominally head of the F., and the Archbishop of Köln was styled imperial lieutenant. Societies of like nature are said to have been organized in Italy.

Fence (lit. 'that which defends' or 'guards'), a wall, hedge, or railing used for enclosing agricultural land, or for dividing it into fields. The F. most suitable for agricultural purposes consists of a rough stone dyke, but this form is only practicable in situations where stone is abundant and easily obtained. In many parts of Scotland most substantial and serviceable dykes are built from the boulders which have been removed from the fields they enclose. The lee side of a F. of this description affords excellent protection to cattle and sheep, while the F. occupies much less ground than hedges of any kind and needs no trimming. In England hedge fences are much more abundant than in Scotland, and their extent and abundance has occasioned great complaints of unnecessary waste of agricultural land. Hedges are most commonly formed of hawthorn, but the following trees and shrubs are also used:—Privet, beech, holly, crab-apple, barberry, furze, broom, maple, willow, yew, box, sweetbrier, and some others. To make and keep these living fences in an efficient condition, the plants require different methods of treatment according to their nature, and it is only in certain situations and conditions that some of them will succeed. Fences made of wooden rails and posts, or of shingles, are also very frequently employed in localities where wood is abundant and cheap, but in Great Britain it is now found to be much more economical to use fences of iron wire. These are made either entirely of iron, or the wire may be attached to wooden posts driven firmly into the ground. At certain intervals there are heavy straining posts, between which lighter posts sustain the various strands of wire in their proper relative positions. Where economy is not an object, strong fences of bar and rod iron built in short sections are employed.

Law regarding Fences.—Any one stealing or cutting, breaking, or throwing down with intent to steal, any part of a live or dead F., or any post, pale, wire, rail (set up as a fence), or any stile, gate, or part thereof, is liable under Statute 24 & 25 Vict. c. 96, for a first offence, to a fine of £5; for a second offence, to a year's imprisonment with hard labour. The Act does not apply to Scotland. Also by Statute 24 & 25 Vict. c. 97, any person convicted of unlawfully and maliciously injuring any of the mentioned fences or parts of fences, &c., becomes liable to the same penalties for first and second offences. In England a tenant is bound to keep fences in good repair, and with regard to them he must act according to rules of good husbandry. In Scotland a landlord is bound, without stipulation in the lease, to put fences on a farm in good repair on the entry of the tenant; but the tenant must maintain them and leave them in as good condition as when he received them. With regard to fences erected spontaneously by the tenant, it has been decided that if he is not entitled to remove them, he is not bound to repair them.

Fen′cible, a combatant or regiment of combatants levied to serve in defence of the country during a crisis, such as that of a threatened invasion. During the French war almost every country had its corps of 'Fencibles.' The name survived in the 'Royal Malta F. Artillery,' which is now called the Royal Malta Artillery, and won the distinction of the Egyptian medal in 1882. There are one lieut.-colonel, four majors, four captains, five lieutenants, one 2nd lieutenant, &c.

Fen'cing is the art of using the sword skilfully in attack or defence. It is one of the oldest of all modes of fighting, and was cultivated widely by the ancients. The Roman gladiators were well trained in handling the sword, but as they also defended themselves with armour and shields, their movements in fence were few and simple. As known in modern times, F. may be said first to have come into practice as the ponderous weapons and metal casings of feudalism were passing into disuse. During the religious wars of the Emperor Karl V., the prevailing sense of insecurity in Italy led to the general adoption of the small-sword as a safeguard by the civil classes. The Italians rapidly carried F. to great perfection, and subsequently introduced the art into Spain and France. A school was established for its prosecution in Paris, where fresh subtleties and improvements arose from day to day. The early Spanish and Italian schools generally drilled the fencer in the management of the dagger and the mantlet; to change position rapidly in avoiding attack was also regarded as necessary. But in more recent times all adjuncts were discarded in favour solely of the rapier, while the increased force and velocity of attack endangered the life of any one attempting to shift ground. As a ready and equable weapon, the rapier was long universally employed in Duelling (q.v.); and since the general abandonment of that practice, F. has continued to hold its ground firmly as an attractive, healthy pastime. In the modern exercise the Foil (q.v.) has supplanted the rapier, and the face of the fencer is defended by a strong wire mask. Space will only here permit of a description of the chief blows or thrusts and guards, together with a brief definition of the phrases in common use. The *guard* is the wary attitude which the swordsman most naturally assumes, advancing the right foot 24 inches in front of the left, slightly bending the knees, resting the weight of the body mainly on the left leg, and holding the foil extended at the height and in front of the breast. When on guard, it is essential, by supporting the foil over the right or left breast, to *cover* the side towards which the adversary's weapon points. The guard is a passive, the *parry* an active, defence. In F., the left arm, which is extended to the rear, is of great assistance in preserving the equilibrium. The *engagement* is the act of crossing foils. There are three engagements—(1) when the blades are brought in contact on the right side; (2) when on the left; and (3) when they cross obliquely from left to right, and the points are on a level with the groin. These may be changed rapidly, but from one or other of them all blows are made. The *blow* is the act of forcibly advancing the point towards one's antagonist either by simple thrust with the arm or by the heavier lunge, in which the right foot, and consequently the upper part of the body, is thrown quickly forward. There are three main points of attack. These are (1) the breast or, as it is called, the *inside*; (2) the face, on either side of the opponent's weapon, the *outside*; and (3) the body below the sword-arm, spoken of simply as *below*. Two of these points are always exposed, it only being possible to guard one at a time. To *parry*, which is done on the *forte* or part of the blade nearest the handle, is to divert the thrust of an antagonist's weapon. Ten guards are regarded as affording complete protection, and these are designated by the old French ordinal numbers—prime, seconde, tierce, quarte (carte), &c. Tierce, quarte, quinte, and six are called simple parries, only requiring the weapon to be slightly moved from guard. In prime, seconde, sept, and octave, which are called half-counters, the point describes a half-circle. The two remaining are known as counters, from the weapon having to sweep a complete circle in their execution. The counter has two advantages—(1) It cuts all the lines of attack in its ellipse, and (2) it throws the opponent's weapon to the side, leaving him exposed to a direct return blow. A *double counter* is a form of parry in which two rapid counters are made consecutively; it gives great command of the weapon, and should therefore enter regularly into practice. In assault, the *feint* is of great effect, being through all its modifications merely an attempt to throw one's adversary off his guard by illusive thrusts. The *riposte* is the name given to the blow with which one follows up a successful parry. A blow delivered at the flank of the antagonist when he menaces at the 'left' is called a *flanconade*. Fencers do not tierce, or carte, &c., at the same time, but A lunges while B guards. The motion of advancing and retreating is performed by rapidly withdrawing the left foot some 18 inches, and instantly following it with the other, and *vice versâ*. One must retreat as the adversary advances, unless ready to offer him the sword-point. *Appels*, or beats with the right foot on the floor, and *glissades*, or glidings of one's weapon over the adversary's, are mainly intended to confuse and lay the enemy open to thrusts.

The cavalry sword exercise is only a modification of F. adapted to horseback, and the attack and defence with the foil is the basis for that of the sabre. Bayonet exercise, as another form of F., is cruder and clumsier, but extremely formidable. The *throw*, during which the forward hand unclasps the rifle, is a later thrust that is made to the full extent of the other arm. This, when delivered precisely, is often a winning thrust, yet it must always be risky, as it leaves the body of the thruster exposed and unprotected, until *recovery*.

Fén'élon, François de Salignac de la Mothe, a great French ecclesiastic, whose name is revered throughout Christendom, was born at Fénélon in Périgord, 6th August, 1651. He was descended from the Marquis de la Mothe, a well-known diplomatist during the St. Bartholomew Massacre period. At the age of fifteen he passed from the college of Plessis to the seminary of St. Sulpice, where he took holy orders in 1675. He was then made superior of the 'New Catholics,' an institution patronised by Turenne for the edification of converts in the faith. Here he remained till 1691, composing his book *De l'Éducation des Filles* (1687), and joining in Bossuet's *promenades* and *conférences* at St. Germain. He also wrote a *Réfutation du Système de Malebranche sur la Nature et la Grâce*, revised by Bossuet, and a book against the *status* of Protestant ministers, which no doubt helped to pass the revocation of the Edict of Nantes. After that event he was sent with Fleury to convert in Poitou. In 1689 he was selected as tutor for the Duke of Burgundy, heir-presumptive to the crown, for whom he wrote his *Fables*, his *Dialogues des Morts*, and also the once famous *Les Aventures de Télémaque*. He was much in the good graces of Madame de Maintenon, who consulted him about the rules of her new institution, St. Cyr. F. became successively abbé of St. Valery, near Amiens, and Archbishop of Cambrai. Now began his connection with Quietism. This was a form of spiritualism which aimed at producing a special kind of ecstatic existence in which all the daily duties of life would be performed, but everything with the immediate sense of God's presence. The tendency of this perpetual adoration was, however, to weaken the active powers. F. became acquainted with Madame de Guyon and Père Lacombe, and did not share the dislike of Bossuet, Bourdaloue, and other eminent divines, for doctrines of 'pure love,' &c., which, whether within the compass of human nature or not, were hardly suited for a court of which De Maintenon was the head. On Madame de Guyon's imprisonment, F. published his *Explication des Maximes des Saints* (1697), to show authority in the recognised Christian mystics for the gradual removal from the mind of the desire of reward and the fear of punishment. This Bossuet called 'fanaticism,' and the book was submitted to examination at Rome. After sixty-four congregations had met and discussed, the votes were discovered to be equal. In the meantime, the doctors of the French Sorbonne had condemned the book, and F. lost his pension and his post of royal teacher. While Bossuet damaged his cause by the offensive personalities contained in his *Account of Quietism*, the influence of the king easily procured from Innocent XII. a special verdict of the congregation of cardinals, setting forth twenty-three propositions in F.'s book as rash, scandalous, erroneous, &c. F. at once submitted but was never reconciled to the court, which soon after tried to suppress his *Télémaque*. This work had been stolen in MS. by a servant, and published without F.'s authority. Its success over a great part of Europe was immense. F.'s archiepiscopal life at Cambrai was marked by strict performance of professional duty, and a simplicity of life and real sympathy with the poor very unusual in high dignitaries of the Church. One touching fact is that during the wars he was never molested, but equally revered by the hostile armies of English, German, and Dutch. F. was a man of great sweetness, piety, and dignity of character, and these fine qualities are always conspicuous in his writings. He was disinterested even to generosity in money matters, and zealous for the welfare of his Church. He desired that the rule forbidding the Scriptures to be read in the vernacular should be relaxed, at least in his diocese; and he defended the Jesuit missionaries from the charge of having adopted the superstitions of the Chinese. About 1702 the Jansenist war broke out again on the publication of the book called *Le Cas de Conscience*. F. took part in it on the side of the Church. He also wrote on political subjects, suggesting the revival of the States General, not as representative assemblies, but as royal councils, and denying the right of civil interference claimed for the Pope. F. died 7th January, 1715. Complete editions of F.'s *Œuvres* are those of Bausset (Par. 1821-24) and of Gosselin (1853). A favourite collection is that entitled *Œuvres Choisies de F.*, containing an *Éloge* by La Harpe and a biographical and critical sketch by Villemain. The *Correspondance de F.*, from original documents, was published by Caron (Par. 1827-29). See Bausset's *Histoire de F.* (Par. 1808).

Fenestell'a, a genus of *Polyzoa* (q.v.), including those forms familiarly known as 'lace corals,' from their close resemblance to delicate lace, although they have no relationship to the true Corals (q.v.). The species of F. are typically Palæozoic. They begin in the Lower Silurian rocks, and extend to the Permian series, but are most frequent in Carboniferous strata.

Fe'nian (so called from the mythical *Fionna Eirinn*, an Irish national militia, levied as early as 400 B.C., but which took its name from Finn or Fioun MacCumhail, the famous hero of Irish legend) was a national association, the main object of which, formerly kept secret, but afterwards avowed, was to overthrow English rule in Ireland in favour of a native republic. This association, the origin of which is traced chiefly to the Irish famine of 1846-47, during which so many Irish were forced to emigrate, and to the insurrectionary movements of 1848, which increased the number of enforced exiles, was organized in America and Great Britain as a society for the restoration of Irish independence in 1859. The society was framed on the republican model. It consisted of social, district, and state 'circles,' each circle under the direction and control of a 'centre,' and the management of the whole organization vested in a senate or 'congress.' F. congresses were held in Chicago in 1863, and in Cincinnati in 1865, and after the latter the order embraced 80,000 members in America. From this time the activity of the Fenians was unbounded, if for the most part ineffectual. In the United States several attempts were made in 1866 to invade Canada, which proved, however, ludicrous failures, and in 1867 an attempt, equally abortive, was made to create a revolution in Ireland. In September, 1867, a number of daring leaders of the movement attacked a police van in Manchester, killed the officer in charge, and released the prisoners, who were under arrest for complicity in the late insurrection. The release of F. prisoners was the object of the attempt to break into Clerkenwell prison by blowing down its walls with gunpowder, an attempt attended with great destruction of life and property. At this period considerable excitement prevailed throughout England. A rising of the Irish was feared in London, and special constables were sworn in for the preservation of the peace. The number of suspected Fenians arrested from the 1st January, 1867, to the 31st January, 1868, was 265, of whom 95, including many most daring and influential members, had come from America, where having been engaged in the War of Secession, they refused to return to civil life. In May a party of 2000 invaded Canada from Vermont in the United States. They 'were ninety minutes on Canadian soil,' when they were driven back across the frontier with the loss of one man.

In 1868 the F. cause lost ground owing to an attempt on the life of the Duke of Edinburgh in Australia by O'Farrel, who, however, protested that he was not a F., and to the assassination of Thomas D. McGee, a Canadian minister and opponent of Fenianism. According to the Queen's Speech in July, 1868, it would appear that the Ministry regarded Fenianism as crushed. In 1869 a deputation, headed by the Lord Mayor of Dublin, attended at the bar of the House of Commons, and presented a petition of amnesty for the prisoners. Several were released. In 1869 the Irish Church was disestablished, and in 1870 an Irish Land Bill was passed. Both concessions were claimed by the Fenians as results of their active policy. In 1871, during Mr. Gladstone's tenure of office, most of the F. prisoners were released on their undertaking to leave the country, and Fenianism sank into obscurity, which lasted for some years. Fresh vigour was inspired by the formation of the Land League, and ere long the brotherhood commenced to threaten, and then to act. The atrocious murders, in 1882, of Lord Frederick Cavendish and Mr. Burke, secretary and under-secretary to the Viceroy of Ireland, were followed by several attempts, more or less unsuccessful, in 1883 and 1884, to destroy life and property in England by means of explosives, but these acts may be attributed to a certain section of sympathizers with the National movement in Ireland, and must certainly not be referred to any programme of the Fenians, who by that time may be said to have ceased to exist as a recognised party of rebellion in Ireland. See Rutherford's *Secret History of the Fenian Conspiracy*.

Fenn'ec, a species of Carnivorous Mammalia, belonging to the family *Canidæ* (q.v.) or Dogs (q.v.), and nearly allied to the foxes. It is also known by the name of 'Zerda,' and is found in Nubia and Egypt. Its average length is about 8 inches, and the colour is a pale fawn, the base and tip of the bushy tail being black. The F. is an active little animal, and appears to subsist, notwithstanding its carnivorous nature, almost entirely upon fruits. It inhabits burrows, which it excavates in sandy places. The fur is valued by the Arabs.

Fennec.

Fenn'el, a genus of *Umbelliferous* plants belonging to the Harmless or Esculent section of the order. The common F. appears to have originally come from S. Europe. The fruit consists of a *cremocarp*, composed of two single-seeded portions or *achenes* united by their faces, and exhibiting a ribbed appearance. Common F. attains a height of 3 or 4 feet. It is a biennial plant, and its leaves are served with fish, either whole, or in the form of a sauce. Another species is sweet F., also named Italian F. from being cultivated in S. Europe. It yields an aromatic, and *oil of F.* is obtained from it. Other species are Cape F. of S. Africa, and the

F. of India. The giant F. of S. Europe belongs to the genus *Ferula*.

Fennel.

Fenn'y (*Pheni*), a river of India which rises in the hill tracts of Tipperah, Bengal province, flows between Tipperah, Noakali and Chittagong districts, and falls into the Sandwip Channel, a corner of the Bay of Bengal. It brings down much hill produce, chiefly cotton, tobacco, and timber, though it is only navigable for large boats for thirty miles or so from its mouth.

Fens. See BEDFORD LEVEL.

Fen'ugreek, a genus of Exogenous plants included in the natural order *Leguminosæ* (q.v.), and in the *Papilionaceous* section of that group. The plant is distinguished by the appearance of the flowers, which have a small *carina* or keel, the *alæ vexillum*, together forming the most prominent parts of the flower. The leaves are obovate, and are stipulate. The common F. inhabits S. Europe, but is also largely cultivated in India. The name F., or 'Greek hay,' is derived from the fact that in Greece, as well as in India, it is used as fodder. The pods are cylindrical, and recently it has been stated that the seeds are exceedingly nutritious, and might with advantage be used as a dietary. There is a nearly-allied species also grown in India, and the edible F. affords food in the latter country. A British species grows in sandy soil, generally near sea-coasts.

Fen'yes, Elek', a Hungarian geographer, was born at Csokaj, 7th July, 1807, studied law at Debreczin and Presburg and sat in the Presburg diet of 1830. He then devoted himself to geography and statistics, and settled at Pesth in 1836, where he became director of the Industrial Society, and editor of two journals. During the Hungarian revolution he was appointed, in 1848, chief of the statistical department in the Ministry of the Interior. He was for some time president of the war tribunal at Pesth in 1849, and in the same year was imprisoned by the Austrians. He then retired into private life. His works are comprehensive and accurate, and give the first reliable survey of Hungary. They were written in Magyar, but several of them have been translated into German. The chief are—'State of Hungary and the Neighbouring Countries,' 'Statistics of Hungary,' and 'General School Atlas.'

Fe'odor (the Russian form of *Theodore*, Gr. 'Gift of God'), is the name of three czars.—**Feodor I.,** son of Ivan the Terrible, was born 11th May, 1557, succeeded to the throne in 1587, but left the government to his brother-in-law, Boris Godunov. He died 7th January, 1598, the last of the race of Rurik.—**Feodor II.,** son of Boris Godunov, reigned only for a short time, being murdered 10th June, 1605. To him succeeded the first of the 'false Dimitris.'—**Feodor III.,** the son of the Czar Alexei, was born in May, 1661, and ruled from 1676 to his death, 26th April, 1682. He warred with varying success against the Turks and Poles. In his reign the first learned academy was founded in Russia. F. was succeeded by his brother, the famous Peter the Great.

Feodo'sia. See KAFFA.

Feoff'ment, in English law, was a grant of lands to another in fee, to him and his heirs for ever, by the actual delivery of seisin. The grantor was called the *Feoffer*, he that received was the *Feoffee*. It is the oldest form of conveyance of real property. *Livery of Seisin* was the feudal investiture on delivery of the possession of the land or tenement to another, by giving him in the former case a piece of turf from it, or twig of a tree grown on it; in the latter case, by giving the latch or key, or by some similar act. The formality has been superseded by deed of grant under 8 & 9 Vict. c. 106.

Feoffment to Uses was an artifice of the clergy to avoid the prohibitions against Mortmain (q.v.). The feudal form was applied so as to give the possession to some one as a trustee for the Church or for an ecclesiastic. The evasion was regarded favourably by the judge of the Chancery Court, who in those days was usually a priest. See USE, USES, AND TRUSTS. In Scotch law, see INFEFTMENT, SASINE.

Fer'æ Natu'ræ, a term applied in English law to all kinds of beasts and birds which are not tame or domesticated. According to Roman law these became the property of any one catching them, though it was held that no one was entitled to enter the ground of another in the chase. But a trespasser who caught his game was held to be entitled to keep it, though liable in damage to the proprietor of the land on which he trespassed. In England if *game* be found in the possession of any one trespassing, he may, under statute, be required to deliver it to the person having the right, or to his servant or gamekeeper; and if delivery be refused, the game may be taken forcibly. But the statute does not apply to animals which are not game. (See GAME LAWS.) Curious questions of common law arise as to the right of property in animals F. N. For example, the question came before the supreme Scotch law court some years ago as to the right of property in a whale which, having been harpooned by one party, had broken the attached rope, and been subsequently secured by another whaling party. Eskimo witnesses were fully examined as to local custom, and decision was given, we believe, in favour of the actual captors. A swarm of bees, if it can be identified, belongs to the owner of the parent hive. F. N., when reclaimed and tamed by a man, or confined by him, may become his property and continue so, so long as he retains possession of them, or when they escape, they have become *homing*, as hawks, pigeons, &c.; also, when they breed on his land, he attains a property in their young while unable to escape; also, when he has the right, as against everybody else, to hunt and kill them, he acquires a property in them so long as they remain within the land over which he has such rights. Dead and edible F. N., or when reclaimed or confined, may be subjects of larceny, but while living they cannot be. A landlord cannot distrain F. N. for rent. See FORESTS, SALMON-FISHING, TROUT-FISHING.

Fer de Lance, a well-known and most virulent species of Viperine snakes, included in the Rattlesnake (q.v.) family (*Crotalidæ*). It inhabits Brazil and some islands of the W. Indies, and is commonly found in sugar plantations. A large pit exists in each side of the head between the eye and nostril, as in other members of the family *Crotalidæ*. The usual length is 5 to 6 feet. The colour is olive above, with cross markings of darker hue, and whitish grey below, the head being of a brown colour. The tail has no 'rattle,' but is provided with a spinous process. The bite of the snake is fatal usually within a few hours, mortification spreading rapidly from the part bitten to other portions of the victim's body; and even where recovery takes place, the effects of the poison may persist for long periods.

Fer'dinand, a name borne by the sovereigns of various European countries.

German Emperors.—**Ferdinand I.,** the second son of Philip the Handsome, Archduke of Austria and King of Castile, was born at Alcala, in Spain, in 1503. He married Anna, daughter of Ladislas VI.; and on the death of his brother-in-law, Ludwig II., at Mohacz, in 1526, he added the thrones of Bohemia and Hungary to the Austrian archduchy and the palatinate of Upper Alsace. His possession in right of his wife was, however, disputed by John Zapolya of Transylvania, seconded by Suleiman II. A long war was closed by the peace of Gross Waradein in 1538, but renewed by John Sigismund on his father's death. Named King of the Romans in 1531, F. became emperor in 1558 on the abdication of his brother Karl V. He was the last King of the Romans, or emperor elect, crowned at Aachen on the marble throne found in the tomb of Karl the Great. F., who had before oppressed the Calixtines and Lutherans in Bohemia, now urged the latter unsuccessfully to join the Council of Trent. He tried to get the sacrament in two kinds and priests' marriage from Pius IV., but failed. He died 25th July, 1564.—His grandson, **Ferdinand II.,** born at Gratz, 9th July, 1578, was the son of Archduke Karl of Carinthia and Styria, and Maria of Bavaria. He became King of Bohemia (1617) and Hungary (1618), and succeeded his cousin Matthias as emperor in 1619. His Ultramontane tendencies were well known, and there was a great revolt under Count Thorn in Bohemia, helped by Bethlen-Gabor and the Hungarians, Moravians, and Silesians. The siege of Vienna was raised, but with the approval of the Protestant Union the Bohemians elected as king Friedrich, the Elector Palatine. With the help of the Catholic League, especially of Johann Georg, Elector of Saxony, F.'s general Tilly crushed the Bohemians. The Charter of Rudolf II. was destroyed; the Reformed preachers sent out of the country, and with them thousands of the inhabitants. The alliance of Christian IV. of Denmark was, in spite of the bravery of Brunswick and Mansfield, overturned by Wallenstein, and the Peace of Lubeck (1629) was followed by the Edict of Restitution, directing the property of the Catholic clergy to be given back by the nobles, who had seized it so long ago as 1555, and excluding Protestants from the Peace of Religion. Now, however, Gustavus Adolphus was in the field, nor did the Catholic nobility relish the idea of restitution. Therefore, though Lutzen (1632) was soon followed by Nordingen (1634), which left the Swedes almost alone in the cause of religious freedom, this edict was never properly carried out. F. died 15th February, 1637.—**Ferdinand III.,** son of preceding, born at Gratz, 11th July, 1608, succeeded his father on his imperial and royal thrones. He reluctantly continued the war against the Swedes, now backed by Richelieu, who wished to weaken the Habsburg house. The preliminaries of Hamburg, ratified by the Congress of Münster and Osnabrück, at last led to the Peace of Westphalia (1648), just when the Swiss Wrangel had entered Prague. F. died 2nd April, 1657. A reform of the judicial arrangements in Germany took place during his reign.

'Emperor' of Austria.—**Ferdinand I.** (Karl Leopold Franz Marcellin), eldest son of the Emperor Franz I. and Maria Theresa of Naples, was born at Vienna, 19th April, 1793. He was sickly in mind and body. In 1830 he was crowned *Rex Junior* of Hungary, and next year married Maria, daughter of Vittorio Emanuele of Sardinia. Succeeding his father in 1835, he left foreign affairs in the hands of Metternich, but published an amnesty for political offences in Lombardy. The insurrection in Galicia was followed by the revolutionary movement of 1847-49. F. promised a constitution, dismissed Metternich, and then in 1848 abdicated in favour of his nephew, Franz Josef. Roads and railways were largely constructed in Austria under F.'s influence. He died 29th June, 1875.

Kings of Aragon or Castile. (1) *Aragon.*—**Ferdinand I.,** the Upright, King of Aragon and Sicily, the son of Juan I. of Castile, was born in 1373. His disinterested treatment of his nephew, Juan II. of Castile, and his successes against the Moors (especially in taking the city of Antequera), secured his election from a number of competitors to the throne of Aragon in 1412. His intervention in Sicily on behalf of Blanca, widow of Martin I., was marked by the same spirit of justice and courage; and in the Church he exerted himself on the side of peace, entreating Benedict XIII. to retire, and so end the schism. F. died in 1416, and was succeeded by his son, Alfonso V. the Wise. (2) *Castile.*—**Ferdinand I.,** the Great, was a son of Sancho III., King of Navarre, who first liberated Castile from the rule of Bermuda, or Veremund, III. of Leon. F. afterwards annexed Leon and Asturias to Castile. He confirmed the ancient *fueros* of the people, and collected the code of Visigothic law. A victory gained over his brother on the 'Field of Murder' confined the power of Navarre to a territory beyond the Ebro. F. then made a brilliant campaign against the Moors. He was the founder of Castile, and styled himself Emperor. This alarmed Heinrich the Swart, German Emperor, and the Pope was called in. The 'Cid' belonged to this reign. F. died in 1065.—**Ferdinand III.,** the Pious, was born in 1199, succeeded his mother as sovereign of Castile in 1217, and his father, Alfonzo IX., as King of Leon in 1230. He suppressed the revolt of the Lara family in Castile, and then attacking the Moors in Andalusia, captured Cordoba in 1236. Twelve years later Seville fell, and the Emir of Granada was compelled to pay tribute. F. died in 1252. He burned the Albigenses who had fled to him for protection, but did much to check lawlessness, and founded the famous University of Salamanca. The Archbishop Rodrigo Ximenes of Toledo wrote his biography, *Cronica del Santo Rey Don F. III.*—**Ferdinand IV.,** the son of Sancho IV., the Brave, reigned over Castile from 1295 to 1312. A great war with Portugal and Aragon, each supporting a claimant to the crown, in which the heroic Perez de Guzman fought for F., was ended by double royal alliances. In his Moorish campaigns (1305-6) F. captured Gibraltar. He was on good terms with Pope Clement V., who gave him the right to levy a tithe on Church property, and to confiscate the property of the Templar order.

Kings of Spain.—**Ferdinand V.** of Aragon, known as F. the Catholic, born 10th March, 1452, was the son of Juan II., King of Navarre and Aragon. In 1468 F. was declared by his father King of Sicily, and next year, in spite of the rivalry of Alfonso V. of Portugal and Louis XI. of France, he married Isabella, Princess of Asturias, daughter of Juan II. and sister of Enrique IV. of Castile. After some years' skirmishing with the French, the death of Enrique (probably by poison) permitted F. and his wife to assume the royal power in Castile. A powerful party was formed against them by the Infanta Juana *Beltraneja*, or the Bastard, daughter of Enrique, who was affianced to Alfonso V. F. soon routed the Portuguese army at Toro, and drove the French from Roussillon. The Pope having recalled the dispensation for the marriage of Juana and Alfonso, peace was made in 1479. Internal peace was also in great measure restored by the institution in towns and villages of the *Santa Hermandad* ('holy association'), half militia, half police, to suppress crime in each district. This incidentally weakened the powers of the feudal nobility. The consolidation of the Spanish monarchy was inaugurated in Castile by the abolition of franchises and the imposition of taxes. In 1481, with the approval of Pope Sixtus IV., F. started the Inquisition, nominally to punish those Jews and Moors in Andalusia who, having taken Christian baptism, were secretly practising their old religion, but quite as much that he might strike his political enemies in the dark. Owing to the divisions among the Moors, Muley Abul Hassan and Boabdil both claiming their allegiance, it was comparatively easy for Gonzalvo of Cordoba to subdue Granada. After ten years' fighting, in 1492 the Spanish dominion was assured, the Moorish claims being renounced on condition that the Moorish inhabitants should be allowed the exercise of their religion. This agreement was afterwards broken. To the great hurt of Spanish commerce, the Jews, numbering, it is said, 800,000, were also expelled from Spain, except those who accepted baptism. The policy of F. was ably carried out by his minister, Cardinal Ximenes, and the glory of his reign enhanced by the expedition of Columbus. Queen Isabella by her will left Castile to Juana the Foolish, wife of Philip the Handsome, Archduke of Austria, F. to be regent. Philip, by an armed demonstration, forced F. to resign the regency, but soon after died, and F. reobtained the regency. Always zealous for the Church, F. now made two successful expeditions into Africa, where he was acknowledged by Tunis, Algiers, and Tripoli, and also lent assistance to Pope Julius II., who suffered a heavy defeat at Ravenna. The conquest of Navarre left him master of the whole of Spain. He died at Madrigalejo, 23rd January, 1516. See Prescott's *History of the Reign of F. and Isabella of Spain*.—**Ferdinand VII.**, born 14th October, 1784, was the son of Charles IV. of Spain and Maria Louisa of Parma. Weak in mind and body, he was entirely led by his tutor Escoiquiz, who gradually formed a party round the young prince hostile to the minister Godoy (q.v.) and the queen-mother, and therefore favourable to British influences. His young wife, Maria Antonietta of Naples, died in 1806; Escoiquiz was removed from court; and for some time F. lived in wretched solitude. He then began to correspond with Napoleon. This being discovered, he was tried in the famous case at the Escurial, and all his accomplices (whose names he confessed) were exiled. The French, however, entered Spain, the Spanish troops revolted at Aranjuez, Godoy fled, Charles IV. abdicated, and F. was proclaimed king under the auspices of Murat, stationed at Madrid. Still desiring French protection, F. foolishly met Napoleon at Bayonne in 1808, the result being that it was declared the Bourbons had ceased to rule in Spain; Joseph Bonaparte became king, and F. was sent to Talleyrand's house at Valencay, where he behaved in the most undignified manner. He had, in fact, sold his country's honour for a promise of Navarre and £32,000 a year. Although Joseph reintroduced the Cortes, he could not pacify the country; guerilla leaders appeared in almost every district, and after six years' fighting F. was at the end of 1813 sent back as king on condition that he would drive out the English. The Cortes made it a further condition that he should sign the moderately Liberal constitution which had been proclaimed at Cadiz in 1812. This F. repudiated by the Valentia Decree (4th May, 1814). The document was applauded by the Absolute (*Netto*) or Servilest party, and a reign of terror and darkness began in Spain. The Inquisition was recalled, and education formally put in the hands of the Jesuits; and only by the intervention of Britain were the members of the late Cortes saved from death, many of them being sent to the galleys instead. At last, in 1820, the army revolted and proclaimed the Constitution of 1812, which F. swore to observe. This constitution did not guarantee religious liberty to any extent. The king did everything in his power to enfeeble the government, refusing his *veto* without reason, and dismissing ministers whenever the Cortes met. In 1823 Louis XVIII., acting on the principles of the Holy Alliance, sent 100,000 men to the help of F. The result was that the Cortes retreated to Cadiz and dissolved, and F. at once proceeded to declare null all the solemn acts of three years. Even the advice of ultra-royalist laymen was despised by this absolute king, and in 1826 there was an *auto-da-fé* at Valencia! In 1829 F. married his fourth wife, Maria Christina of Naples, on whose suggestion he issued the decree, which has cost Spain so much blood, that women may succeed to the throne. F. died 29th September, 1833. See *Memoirs of F.*, translated by Quin.

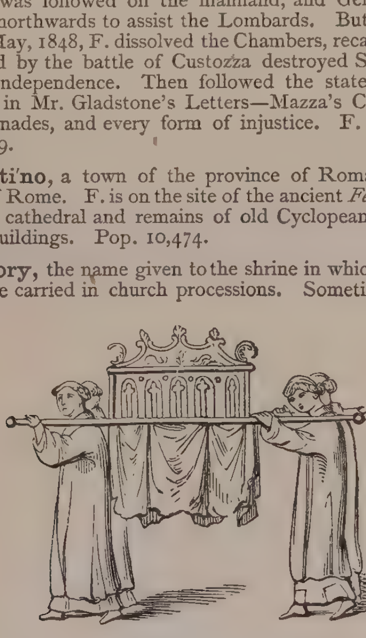
Sovereigns in Italy.—(1) *Tuscany*.—**Ferdinand I.** de' Medici, third Grand Duke of Tuscany, born in 1549, was a son of Cosmo the Great. He was made a cardinal by Pius IV., and succeeded his brother Francisco in 1587. F. energetically suppressed the Tuscan brigands under Piccolomini, and with the help of the Knights of St. Stephen he cleared the Italian coast of the Moslem pirates, whom he pursued to Cyprus and Africa. His policy was that of friendship to France, for he saw Spain threatening the liberties of Italy. He therefore lent large sums of money to Henri IV., and sowed discord between Pope Sixtus V. and Olivares, the ambassador of Philip II. F. also had friendly relations with the Protestant princes in Germany, and the Jews and other heretics expelled from Spain found a refuge in Leghorn. Dying in 1609, he left enormous wealth to his son Cosmo.—**Ferdinand III.**, born at Florence, 6th May, 1769, was the son of the Grand Duke Pietro Leopold, who became German Emperor in 1791. F. was the first Italian sovereign who recognised the French republic in 1793. In spite of this a provisional republican government was set up in Florence, which lasted till Suwarrow drove Moreau and Macdonald from Italy. After Marengo, when Tuscany was converted into the kingdom of Etruria, F. retired to Vienna, where, as Elector of Würzburg, he was admitted into the Confederation of the Rhine. In 1814 he returned, and spent his remaining years in carrying out a humane and liberal policy. He opened up communications and organized public schools, and Tuscany was not disgraced by those harsh and secret proceedings against *Carbonari* which were seen in other Italian states. He died 17th June, 1824.

(2) *Naples*.—**Ferdinand I.**, born in 1423, was the natural son of Alfonso V. the Magnanimous, of Aragon, who bequeathed Naples to F., Sicily with Aragon going to Juan. Though Pope Nicholas V. had bound himself to recognise F., Calixtus III. refused the investiture on the ground that F. was born of adultery. By a bull he also forbade recognition by any other state. The next pope, Pius II., was, however, bribed to keep his predecessor's word by the gift of the town of Beneventum. The turbulent barons, the Count Piccinino, Jean d'Anjou, Duke of Calabria (whom Charles VII. of France had made Governor of Genoa), and the Prince of Tarentum, made war on F. in 1460, and gained a decisive victory near Nola in that year. This was compensated by the victory of Troja in 1462, for which F. was indebted to Scanderbeg of Albania. In 1480 F. retook the town of Otranto from Mohammed II. He died 25th January, 1494.—**Ferdinand II.** was the son of Alfonso II., and the grandson of the preceding. When Charles VIII. marched into Italy, F., deserted by Trivulzio, was beaten at Faenza and San Germano (1495) by D'Aubigny and Armagnac, and compelled to retire to Sicily. Next year the influence of F. the Catholic in the Holy League caused the French evacuation of Naples, and the re-entry of F. He died 7th October, 1496.—**Ferdinand IV.** (after 1817, First of the Kingdom of the Two Sicilies), born at Naples, 12th January, 1751, was the son of Don Carlos, afterwards Carlos III. of Spain. He was brought up to know nothing of public affairs, and the government was one long dispute between Tanucci, the minister, and the queen, Maria Carolina, Archduchess of Austria and a daughter of Maria Theresa. The vacillating policy of F. through the wars of the French republic met a proper end in the complete defeat of General Mack by the French in 1798, which caused the king to seek refuge on board Nelson's fleet. The population of Naples fought with desperate bravery against the disciplined troops of France, but the upper classes received them well, and tried to form a Parthenopean Republic. This exciting period has been described in Coletta's *History of Naples*, and in *Sketch of Popular Tumults* (Lond. 1837). Next year, Cardinal Ruffo and the Calabrian peasants besieged the republic in Naples, and finally F. re-entered his capital, having promised an amnesty which was at once violated by the most sweeping measures of political oppression, and unlicensed cruelty. In 1801 he arranged that a French army should again occupy part of his kingdom, and in 1805 he permitted a large army of British and Russians to land. This brought down Massena and 30,000 men, who drove out F., established Joseph Bonaparte, and subdued the country, except in Calabria, where opposition lingered for many years. (See Botta, *History*, book xx.) F. and the queen remained in Sicily, protected by the English fleet, till 1815, when F. resumed royal authority at Naples. In 1820 a revolt, inspired by the *Carbonari* societies, broke out. F. granted the same constitution as the Spanish Cortes had just obtained, but soon after went to a congress of the northern powers at Laybach, and returned with an Austrian army sent expressly to get rid of the troublesome constitution. He died 4th January, 1825. His daughter

Amelia married Louis Philippe.—**Ferdinand V.** (Second of the Two Sicilies), better known as 'Bomba,' born 12th January, 1810, was the son of Francisco I., and grandson of the preceding. He began political life in 1830 by dismissing Viglia, Scaletta, and others from office, and carrying out a scheme of economy in the court and the public service. Unhappily his second marriage with Maria Theresa Isabella, daughter of the Archduke Karl, brought him more under Austrian influence. He introduced the Jesuits into Sicily, and suppressed the ancient constitution of the island. In 1840 he had a serious quarrel with Britain about the sulphur trade. The natural result of these arbitrary acts was repeated insurrection, which was cruelly punished. Ricciotti was the most popular of the leaders. The impulse of the election of Pius IX., 'the reforming pope,' at last gave to Sicily a constitution substantially the same as that of France in 1830. The example was followed on the mainland, and General Pepe marched northwards to assist the Lombards. But suddenly, on 15th May, 1848, F. dissolved the Chambers, recalled everything, and by the battle of Custozza destroyed Sicily's last hope of independence. Then followed the state of things described in Mr. Gladstone's Letters—Mazza's Commission of Bastonnades, and every form of injustice. F. died 22nd May, 1859.

Ferenti'no, a town of the province of Roma, 42 miles E.S.E. of Rome. F. is on the site of the ancient *Ferentinum*, and has a cathedral and remains of old Cyclopean walls and Roman buildings. Pop. 10,474.

Feretory, the name given to the shrine in which a saint's relics were carried in church processions. Sometimes it was made of wood, or of ivory, beautifully carved *in relievo;* at other times it was of metal, decorated with enamel and chasing. The illustration is taken from one of Matthew Paris' MS.



Feretory.

Fer'guson, Adam, a Scotch philosopher and author of eminence, was born at Logierait, Perthshire, 20th June, 1723, and was educated for the Church at St. Andrews and Edinburgh Universities. After being for a short time chaplain to the 42nd Regiment, during which he showed great gallantry at the battle of Fontenoy (1745), he settled in Edinburgh, where he became in succession Keeper of the Advocates' Library, Professor of Natural Philosophy, and (1764) Professor of Moral Philosophy. He wrote, besides other works, *Essay on the History of Civil Society* (1767), a reply to Dr. Price's work on the same subject, which resulted in his being sent out as secretary to the commission that attempted (1778-79) to bring to a peaceful close the quarrel between the American colonies and the mother country; *Institutes of Moral Philosophy* (1769); *History of the Progress and Termination of the Roman Republic* (1784), the most popular of his works, and translated almost immediately after its appearance into French and German; and *Principles of Moral and Political Science* (1792). F. died at St. Andrews, 22nd February, 1816.

Ferguson, James, F.R.S., was born at Keith, Banffshire, 1710. Of poor parentage and little education, he early showed his mechanical talent in the construction of a wooden watch; and when engaged in tending his master's sheep spent his ample leisure time in contriving machines during the day, and in studying and mapping the stars at night. He thus attracted the attention of influential neighbours, who aided him in his mathematical studies and enabled him to go to Edinburgh, where he gained a livelihood by miniature portrait drawing. In 1743 he removed to London, received a pension of £50 in 1760, became a Fellow of the Royal Society in 1763, and died 16th November, 1776. His principal works are *Astronomy Explained on Sir Isaac Newton's Principles* (1756); *Lectures in Mechanics, Hydrostatics, Pneumatics, and Optics* (1760); *Select Mechanical Exercises* (1773); *The Art of Drawing in Perspective* (1775)—besides several papers in the *Philosophical Transactions*. The *Eclipsareon* was thought by himself to be his best invention. This showed the time, quantity, duration, and progress of solar eclipses in all parts of the world. Sir David Brewster re-edited several of his works. See F.'s autobiography, prefixed to his *Select Mechanical Exercises*.

Ferguson or **Fergusson, Robert**, a poet, born at Edinburgh 5th September, 1750. He was educated at Dundee and at St. Andrews University, became clerk in an Edinburgh attorney's, and published several poems in the Scottish dialect which won considerable fame. Being thus led into society, he ruined his health by dissipation, and died insane, 16th October, 1774. His poetry has a strain of pleasant fancy and humour, and is written in pure Lowland Scotch. Burns called F. his 'elder brother in the Muses,' and is said to have taken his idea of *The Cottar's Saturday Night* from *The Farmer's Ingle* of F. See F.'s works, with a biography by Dr. Irving.

Fergusson, Sir William, Bart., F.R.S., a distinguished surgeon, was born at Prestonpans, East Lothian, 20th March, 1808. Educated at Lochmaben grammar-school and at the High School and University of Edinburgh, he became assistant to Dr. Knox and Dr. Turner in the Edinburgh College of Surgeons, of which institution he was made a Licentiate in 1828 and a Fellow in 1829; began to lecture on surgery in 1831, was made Assistant-Surgeon in the Royal Infirmary in 1836, Fellow of the Royal Society, Edinburgh, in 1839, and Professor of Surgery in King's College, London, in 1840. F. was for five years Examiner in Surgery at London University, was made a baronet in 1865, and President of the Royal College of Surgeons of England in 1870. He was a Fellow of the Royal Society of London, and Sergeant-Surgeon to the Queen. F. wrote several treatises on lithotomy, aneurism, &c., and an admirable *System of Practical Surgery*, and invented many surgical instruments. He died 10th February, 1877.

Feriæ (probably for *fesiæ*, from *festus*) were days of rest, holidays in which all business (especially litigation) was suspended. F. were either private or public, according as their observance was limited to families or individuals or extended to the general community. Occasions for the former class of F. were found on birthdays.' The public F. were of three kinds—*stativæ*, observed regularly every year on a fixed day, such as the Lupercalia; the *conceptivæ*, observed regularly every year, but on days fixed from year to year by the priests or magistrates, such as the *F. Latinæ;* and *imperativæ*, days fixed by the magistrates for supplication or thanksgiving, in connection with some national event. On the F. the people generally visited the temples, and offered prayers and sacrifices, and were strictly prohibited from performing any kind of work. In Old Scotch, *feriat* (also *feryale* or *feriell* tymes) denoted the immunity from prosecution secured during *harvest*, as if every day of it had been devoted to religion.

Ferin'ghees, a name applied by Mohammedans to Christians generally, and derived from the 'Franks' or 'French.' In India it was appropriated to the descendants of the early Portuguese settlers, born of native women, who had retained the Roman Catholic faith, but had in all other respects, even in colour, sunk to the condition of the surrounding native population. They were especially numerous in the neighbourhood of Dacca and Chittagong, and were chiefly employed as cultivators and domestic servants.

Fer'ish'ta or **Firish'ta, Mohammed Kâsim Hindu Shah,** a Persian historian, born at Astrabad about 1570. His father travelled to Ahmednagur in the Deccan, and was there made tutor to Miran Hassein, the son of Murteza Nizam Shah. F. was patronised by Murteza and Miran, and on the latter's death repaired to Bijapur, where he was highly honoured by Ibrahim Adil Shah II., and where he devoted himself to his *Tarikhi Firishta*, or history of the Mohammedans in India. He is supposed to have died about 1612. F.'s history consists of twelve books, is clear and impartial, but takes no notice of the institutions and social state of the people. It is very popular in India, where it has completely obscured the histories on which it was founded. The work was published at Bombay in 1831, edited by J. Briggs, who issued a translation of the whole (Lond. 1832).

Ferman'agh (Ir. Gael. 'the men of Monagh,' or from *Feormagh-eanagh*, 'the country of the lakes'), a county in the W. of Ulster, Ireland. F. is mostly covered with wild mountains (composed chiefly of limestones and sandstones of the Old Red Sandstone period) and a network of lakes and streams, but contains rich arable land and strips of fine wood and undulating pastures. In the central depression of the uplands lies the Great Lake or Lough Erne (q.v.). The chief summits are Dowbally, 2188 feet, and Slieve Baught, 1812 feet. The rivers are small and most of them flow into Lough Erne; Cloddagh, Woodford, Colebrook, Silees, and Arney are the chief. Linen manufacture is carried on, but only on a small scale. Although F. became a county early in the reign of Elizabeth, it remained quite ungoverned till Ulster was 'planted.' In 1641 much of the land was forfeited from the Irish and was handed over to English and Scotch families.

Of the 417,665 acres constituting the area of F., 20,387 are under corn, beans, and pease (oats 19,425), 19,535 under green crops (potatoes 14,605), 5631 under clover, sainfoin, and grasses in rotation, and 1854 under flax. Permanent pasture and grass not broken up account for 59,039 acres, while woods and plantations cover 5632. There are 24,879 acres of barren mountain-land, 2366 of marsh, and 19,746 of turf bog. (See also articles CATTLE, HORSE, PIG, and SHEEP.) There are 23 flax scutching mills in F., representing 146 stocks, and 47 corn mills. Oats and dairy produce are the chief exports. Enniskillen is the chief town.

F. contains two parl. divs., each of which returns one member: N. F., consisting of the baronies of Lurg, Magheraboy, and Tirkennedy, pop. 37,799; and S. F., consisting of the baronies of Clanawley, Clankelly, Coole, Kockninny, and Magherastephana, pop. 36,371. Pop. of county, 74,170.

Fer'mat, Pierre de, a French mathematician, was born at Toulouse, or near Montauban, in August, 1601, and spent the most of his life as an advocate in that town, where he died in January, 1665. He shares with Pascal the honour of having invented the calculus of probabilities, and in his method for finding maxima and minima anticipated the differential calculus; but his reputation rests chiefly upon his ingenious investigations into the properties of numbers. The French claim for him the honour of discovering the differential calculus, Hallam ranks him in genius next to Descartes and describes him as a man 'incapable of envy, forgiving of detraction, and delighting in truth, with almost too much indifference to praise.' A collection of his works was published by his son Samuel in 1679, at Toulouse.

Ferma'ta, in music, the name of the pause, usually indicated by the sign 𝄐. When found at the end of a part it enables the musician to insert extemporaneous matter, should he so desire.

Fermenta'tion (from the Lat. *fermento*, and that from *fervere*, 'to boil') originally signified the boiling or bubbling up of a substance attended with disengagement of gas, and not produced by the action of heat; and in this sense it was employed by the alchemists and early chemists to denote such chemical changes as the solution of metals in acids, &c. The term now, however, has a different signification, and may be defined as the decomposition or change of an organic substance in a definite manner, produced by the action of another organic substance, which does not itself suffer any change, nor lose any of its own material during the process. The latter substance is termed a *ferment*. Fermentations may be divided into two kinds:—(1) Those in which the ferment possesses a definite organized structure, and is, in fact, a plant (or possibly in some cases an animal); (2) those in which the ferment is not organized, but consists of a small quantity of an azotized substance, very often occurring along with the fermentable material. In many instances mineral substance may be substituted for the ferment of the latter order, which is sometimes called a *false ferment*. As an example of the former or true F., the conversion of sugar into alcohol—the *vinous* F.—may be instanced. This is produced by adding to a dilute solution of sugar a small quantity of yeast, and maintaining the mixture as a temperature of from 21°-26° C. Shortly after the addition of the yeast, bubbles of gas begin to be disengaged, and the yeast rapidly increases in quantity, new cells being produced by a process of budding. This action continues until the whole of the sugar is decomposed. The chief products of this F. are alcohol and carbonic acid, the latter being the gaseous substance which causes the frothing, or, as it is technically called, the *working* of the mixture.

It should be observed, however, that although alcohol and carbonic acid are undoubtedly the chief products of the decomposition of the sugar, yet small quantities of several other substances are formed, of which higher homologues of alcohol, glycerine, and succinic acid may be mentioned. Another familiar instance of F. is the souring of milk. This is due to the conversion of the sugar present in milk into lactic acid, and is also brought about by the action of a special organized ferment, differing, however, entirely from the yeast plant. Its spores are introduced into the milk either from the atmosphere, or by contact with vessels which are already contaminated with them. Milk undoubtedly grows sour more rapidly in a dairy than elsewhere, no doubt from the great number of the spores of the lactic ferment present. Of the fermentations produced by the action of a non-organized ferment, the conversion of starch into dextrine, and eventually into dextrose, may be mentioned. The ferment in this case is Diastase (q.v.), a substance produced during the germination of grain. (See BEER.) Another very remarkable instance is the change brought about by the action of emulsine on Amygdaline (q.v.), both of which substances occur in the bitter almond.

Fermented and Distilled Drink, Consumption of. There are no means available of obtaining any reliable estimate of the quantity of alcoholic beverages made and consumed throughout the world; but as in one form or other such drinks are habitually consumed in all nations, the grand total must be prodigious. From customs and excise returns a fairly accurate statement of the consumption in Great Britain and Ireland can be framed. In the seventy years lapsed from 1801 to 1871 the population of the United Kingdom almost doubled itself; while in the same period the ostensible consumption of spirits of all kinds rose from 8,800,840 gallons to 29,151,000. The quantity of malt charged with duty in 1801 was 19,643,345 bushels, and in the year ending March, 1871 it reached 52,929,000 bushels. These figures would appear to indicate a very serious increase in the drink consumed in this country, but they must be regarded as quite untrustworthy, seeing to what a great extent smuggling prevailed during the early part of the century. The returns for the forty years from 1830 to 1870 afford a fairer basis of contrasts, and show upon the whole a decline from 1·16 gallons to 0·95 gallons per head. In the case of Scotland the decrease is very marked, amounting to over 30 per cent., thus indicating a great change in national habits. The quantity of malt charged with duty in the United Kingdom in 1830 was 32,962,000 bushels, equal to 1·62 bushels per head; and in 1871 it had risen to 52,929,392, representing still only 1·68 bushels per head. The individual consumption of malt liquors had thus remained practically stationary over a period of forty-one years. On the other hand, the consumption of wine had increased enormously, and that increase had principally taken place since the rearrangement of the wine-duties in connection with the French Commercial Treaty of 1860. The home consumption of wine, which in 1851 was 6,280,653 gallons, and in 1859 was very little more, had by the year 1869 risen to 14,168,321 gallons, the greater part of the increase consisting of French wines, containing little alcohol. The total quantity of *all* kinds of wines retained for home consumption in 1874 amounted to 17,284,242 gallons.

During the last twenty years the amount of wine imported and retained for consumption in the United Kingdom has gradually been increasing and in 1894 it reached 27,692,598 gallons, of which 11,704,044 were in casks. Over 3½ millions of proof gallons of rum and nearly 2½ millions of proof gallons of brandy were imported in the same year and retained for consumption in the United Kingdom. Our export trade in beer, ale, wines, and spirits in 1894 was 412,590 barrels and over 3¾ millions of proof gallons. Its value was estimated at £2,847,647 (methylated spirits included), which, it is true, paid our *brandy* bill of £2,443,167 but left only a small balance to settle our *rum* account of £3,609,111. The following table sets forth in portentous figures our demand for F. and D. D., beyond the amount we manufacture for ourselves, and is sufficient evidence of the enormous bill which this country annually pays to the foreign wine and spirit merchants :—

IMPORTED FERMENTED AND DISTILLED DRINK IN 1894.

Wine—	Gallons.	Value £	Home Consumption.	Duty £
Wine in casks .	12,099,327	2,708,335	11,704,044	928,838
Still wine in bottles	744,966	417,311	697,739	37,180
White sparkling wine in bottles .	1,510,947	1,882,144	1,431,915	214,765
Red ditto . .	13,381	10,318	12,601	1,890
Total . .	14,368,621	5,018,108	13,846,299	1,182,673
Beer and Ale—	Barrels.	Value £	Home Consumption.	Duty £
All sorts . . .	41,590	95,199	40,647	13,969
Spirits—	Proof Gallons.	Value £	Home Consumption.	Duty £
Rum . . .	6,092,063	422,607	3,609,111	2,011,019
Rum, imitation .	31,206	1,737	31,037	17,218
Brandy . . .	3,401,538	1,437,312	2,443,167	1,363,594
Geneva . . .	336,179	58,560	300,153	167,737
Unenumerated, not sweetened or mixed . . .	2,028,070	96,595	1,168,463	651,651
Methylated in Bond	...	...	617,704	10,294
Unenumerated, sweetened or mixed (tested) .	69,604	116,305	54,465	30,421
Liqueurs, Cordials, &c. (not tested) (gall.)	11,396	17,375	3,818	2,891
Perfumed . .	49,873	112,475	34,931	31,144

EXPORTED FERMENTED AND DISTILLED DRINK IN 1894.

Beer and ale .	412,590 (barrels),	value	£1,463,107
Spirits . . .	3,859,205 (proof gallons),	,,	1,378,404
Methylated . .	20,815 ,,	,,	1,856
Wines . . .	9,567 (gallons),	,,	4,280

On 30th September, 1880, the duty on malt and sugar used in brewing was repealed. In 1884 the excise duty paid on spirits was £14,222,828 and in 1894 it rose to £15,189,345 (exclusive of additional duties collected for local authorities on beer and spirits which amounted to £1,158,666). In 1884 the excise duty on beer was £8,488,169, which became £9,536,948 in 1894 (exclusive of the additional duty already stated). We may, therefore, conclude that the consumption of spirits and beer in this country is greatly on the increase.

Fermented Liquors are alcoholic beverages prepared by the fermentation of infusions of starchy or saccharine substances. A few F. L. are enumerated under the head BEER, but that most extensively consumed throughout the world is wine, which is fermented from the juice of the grape. Cider and perry are fermented from the apple and pear respectively, toddy from the sap of various palm-trees, and Mexican pulque from the *Agave Americana*. There is, however, scarcely a juicy fruit or vegetable sap from which alcoholic beverages may not be prepared. All alcoholic drinks may be divided into (1) F. L.; (2) spirits distilled from fermented infusions or saps; and (3) *liqueurs*, which are sweetened and aromatized spirits, or spirits simply aromatized.

Fer'mo (anc. *Firmum*), a town of Central Italy, in the province of Ascoli-Piceno, 4 miles from the Adriatic, and 30 miles S.E. of Ancona. It is a very ancient town, having been founded by the Sabines before the date of the building of Rome by which it was colonised in 264 B.C. Till 1860 it formed part of the Papal states and was then made over to Italy. It is circled by old walls, has a cathedral and several churches and convents, is the seat of an archbishop, and has some trade in corn, wool, and silk, chiefly carried on by the small harbour, Porto F. Pop. 18,556.

Fermoy' (Ir. Gael. *Feara-muighe*, 'men of the plains'), a town of Cork, province of Munster, in the rich and beautiful valley of the Blackwater, 18 miles N.E. of Cork. It lies on the high road from Cork to Dublin. F. stands on both sides of the Blackwater, which is here spanned by a stone bridge. It was an important military station. The chief buildings are the Roman Catholic cathedral, banks, flour mills, union workhouse which was part of the barracks, and parish church. At the end of the last century F. was simply a collection of cabins, but in 1797 John Anderson, the principal proprietor, built a hotel and barracks. Now F. has become a thriving centre for agricultural produce. Pop. township and mun. bor. (each) 6469.

Fern, Male, the old botanical name still retained to designate a species of ferns, the fronds or leaves of which are bipinnate in form, the pinnules or secondary fronds being oblong and serrated. This species is common enough in Britain, and obtains its importance from its root-stems or *rhizome* being used in medicine as an anthelmintic. The rhizome may attain the length of a foot.

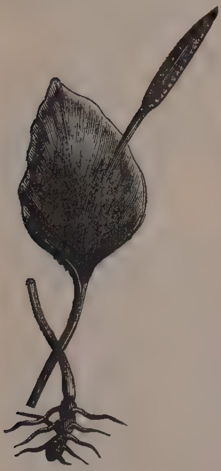
Fern, Sweet, a species of plants belonging not to the Fern order (*Filices*), but to the *Myricaceæ* or Gale order, the plants of which have generally aromatic, tonic, and astringent properties. S. F. is used in N. America as an antidote to diarrhœa. Its bark is aromatic and astringent, and its leaves possess a glandular structure.

Fernan'do de Nor'onha, a group of small islands, about 8 miles long, in the S. Atlantic, 220 miles N.E. of Cape St. Roque. It belongs to Brazil. The largest, called F. de N., which gives its name to the group, is covered with woods, and liable to long periods of drought. It is used as a convict establishment. No woman is allowed to land here. In one place the surface attains an elevation of 1000 feet. The sea around abounds with fish.

Fernando Po, properly **Fernan Po** (in Portuguese *Fernão Po*), an island in the Bight of Biafra, W. coast of Africa, 44 miles long by 20 broad. F. P. is the chief of the Spanish Guinea Isles, the others being Corisco, Elobey, San Juan, and Annabon. F. P. is mountainous, rising in Clarence Peak to 10,714 feet; the soil is fertile, from the number of springs and streams. Discovered by the Portuguese in 1472, and originally named *Ilha Formosa* ('the beautiful isle'), it passed in 1778 into the possession of Spain. Palms, yams, and many other tropical plants abound. Turtle and all kinds of fish are plentiful. The inhabitants are called 'Boobies' and are wanting in good looks and intelligence. Palm-oil and India-rubber are the principal exports. It is used as a place for deportation of persons convicted of political offences. The capital is Clarence Cove, the seat of the palm-oil trade, and originally an English settlement. Pop. of the five islands, 30,000; area, 850 sq. miles.

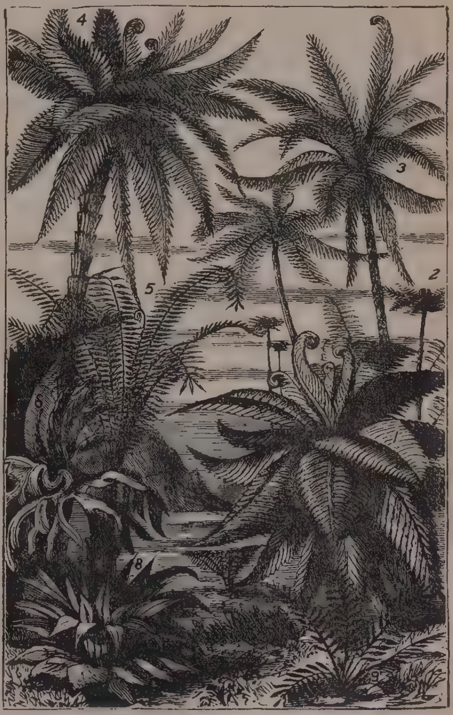
Clarence Peak, Fernando Po.

Ferney or **Fernex** (*Ferney-Voltaire*), a town in the department of Ain, France, at the base of the Jura mountains. Hither the persecuted Huguenots fled for refuge. Voltaire lived here for twenty years, and during that time he, by his energy, raised the place from being a collection of miserable hovels to a position of prosperity. Watch-making was the chief industry. After his death the trade languished. He built a church and a theatre here. Pop. 1200.



Adder's Tongue.

Ferns, an important order of Acotyledonous plants, which are sometimes also named Acrogens, or 'summit growers,' from their mode of growth. They are leafy plants; the leaves, or fronds, are rolled up within the bud after the fashion of a bishop's crosier—this being named *circinate vernation*. The stem exists either in a form of a rhizome or underground stem, or in that of a hollow erect stem. The fructification is borne on the veins of the lower surface of the fronds, or on the margins of the latter. The reproductive organs consist of *sporangia* or spore cases, which may be arranged either in round *sori* or clusters, or in an elongated manner, while sometimes they are covered by a layer of the Epidermis (q.v.) or skin, termed the *indusium*, or they may be entirely destitute of any covering. Occasionally (as in *Osmunda*, the royal fern) the fructification may appear in the form of a spike on the end of a frond. The sporangia or spore cases open or burst by the contraction of an *annulus* or ring, which may encircle the spore cases in various ways. Sometimes the ring may be wanting. The spores of F., when placed in suitable conditions, germinate, and give origin, not directly to F., but to soft cellular structures, each of which is known as a *prothallus* or *pro-embryo*. On the latter, peculiar reproductive cells, supposed to correspond to the ovules and pollen of higher plants, have been found; and by the contact of these latter elements a new embryo is produced which develops into the true fern. This process reminds us of the Alternation of Generations seen in some animals, such as zoophytes. F. grow best in moist places and climates. They flourish in greatest perfection in tropical islands, where they attain a great size and dimensions. In New Zealand they form the characteristic flora, and from 2000 to 3000 species are known. F. have been classified into the (1) *Polypodiaceæ*, with sori borne on the back of the fronds, and covered by an indusium — genera, *Polypodium*, *Adantium*, *Pteris*, &c.; (2) *Osmundaceæ*, or flowering F., represented by the genera *Osmunda*, *Todea*, &c., in which the spore cases are dorsal, or clustered on the sides of a modified frond; (3) *Ophioglossaceæ*, the adder's tongue tribe, with spike-like sporangia; and (4) *Danæaceæ*, with spore cases forming dorsal masses, and represented by the genera *Danæa*, *Angiopteris*, &c.



Tree Ferns.

1, Alsophila excelsa; 2, Dicksonia arborescens; 3, Cyathea elegans; 4, Cyathea arborea; 5, Hemitelia speciosa; 6, Drynaria coronans; 7, Platycerium grande; 8, Bird's nest fern; 9, Asplenium lucidum.

Feroz' or Firoz Canal, an irrigation work in the Punjab, British India, N.W. of Delhi, first constructed by the Moghul emperor Firoz Shah (1351-88), to water his hunting ground at Hissar. In 1568 the works were reopened by Akbar, and further developed in 1626 by the engineer Ali Murdan Khan, under orders from Shah Jehan, to bring water to Delhi. But by 1753 the canal had again become choked, and in 1823 it was restored by the British as part of the Western Jumna Canal (q.v.). The F. C. proper, which follows the old channel, leaves the main line near Karnal, and passes to Hansi through the districts of Karnal, Hissar, and Rohtack. The water here is absolutely necessary, not only for agriculture, but even for the cattle.

Fero'zepore (*Firozpur*), the chief town of the district of the same name in the Punjab, British India, 3 miles from the present bank of the river Sutlej, and 1181 miles N.W. of Calcutta. Pop., including the cantonments, 50,437. It is an ancient town, with a strong fort, and was formerly very populous and supposed to have been founded by Firoz Shah between 1351-87. For fifteen years it was the frontier station of the British power, and the scene of many military and diplomatic events. It contains a memorial church, inscribed with the names of those who fell in the Sikh campaigns. The present streets, shops, &c., were laid out, and the fort rebuilt, by Lord Lawrence. The river traffic is considerable. The arsenal is vast and well-stocked and a large cotton-press in the neighbourhood is a centre of much commercial activity. At the time of the Mutiny, in 1857, the three regiments of sepoys stationed here were partly disarmed and partly dispersed, and the immense magazine in the fort was thus saved.—F. *district* lies along the left bank of the Sutlej, S. of Jalandhar and Lahore; area, 4302 sq. miles; pop. 886,676, of whom 252,200 are Hindus; 226,361 are Sikhs; 1381 are Jains; 404,977 are Mohammedans; 1738 are Christians; and 17 are Parsees. Dhanna Singh, the ruler of F., was the first Cis-Sutlej chief to accept the British offer of protection when Rangit *crossed the Sutlej* in 1808. Consequently he remained in undisturbed possession till his death, ten years later, when being childless, his widow succeeded him and ruled till 1835, in which year it passed to the British. When acquired by the British, the country was desolate and covered with jungle, but it is now fairly populous and cultivated. It is well watered, and in some of the marshes rice can be grown; but wheat, barley, gram, cotton, tobacco, sugar-cane, and millet are the staple crops.

Fero'zeshah (*Firozshah*), a village in the district of Ferozepore, Punjab, British India, 12 miles from the left bank of the Sutlej. It was the scene of the second battle of the first Sikh war, 21st December, 1845, when the British, under Lord Gough and Lord Hardinge, stormed the Sikh entrenchments with great loss.

Feroz, or **Firoz, Shah,** an Indian Emperor of the Toghluk dynasty, reigned at Delhi from 1351 to 1387. In his reign the administration was improved and public works were lavishly undertaken. Of these last, the Firoz-Canal (q.v.) is the most celebrated; but F. is said to have constructed altogether 50 dams across rivers, 30 reservoirs, 100 caravanserais, as many hospitals and public baths, and 150 bridges. See the Chronicle *Tarikh-i-Firoz Shahi* in Elliot's *History of India*, vol. iii.

Ferr'alum, a mixture of the sulphates of iron and alumina, carbolic acid and terebine, has been introduced for crude deodorizing purposes, where the coarser results of decomposition, such as sulphuretted hydrogen and ammonia, have to be neutralised, as in purifying drains, sewers, cesspools, stables, &c.

Ferra'ra (anc. *Forum-Alieni*, 'the market-place of the foreigners'), an Italian city in the province of F., on the Po di Volano, 4 miles S. of the main branch of the Po, and 26 miles N.N.E. of Bologna. F. stands in a low unhealthy plain, is girt by walls, and consists mainly of wide and often grass-grown and deserted streets, with many crumbling palaces. In the centre of the city is a square castle of red brick, surrounded by a deep moat, the former residence of the Este family. The chief buildings are the cathedral of St. Paolo, which has a noble façade and massive campanile, and is rich in frescoes and statues; the churches of San Domenico, Campo Santo, Santa Maria del Vado, and San Benedetto, in which Ariosto was buried. These have many fine paintings, and the tombs of various artists of F. The house of Ariosto, and the cell of Sant' Anna, in which Tasso was imprisoned, are still shown. The university, now only a school of medicine and law, was founded in 1264, and possesses a valuable library of 100,000 vols. The town has some trade in corn, and caviare is made from the sturgeons caught in the Po. F. began to rise in the 5th c., and was included in the exarchate of Ravenna. It was a great trading city in the Middle Ages, and at one time numbered 100,000 inhabitants. In 1240 it fell into the power of the Este family, under whom it became famous as a seat of literature and art, and of the most splendid court in Italy. It was seized by Clement VIII. in 1597, taken by the French in 1796, restored to the Pope in 1814, held by an Austrian garrison from 1849 to 1859, and in 1860 united to the kingdom of Italy. Pop. 76,422.

Ferra'ri, Gauden'zio, one of the most famous painters and sculptors of the Milanese school, was born at Valduggia in 1484, and executed some remarkable frescoes and highly-finished pictures when little more than twenty years of age. Afterwards he visited Rome, worked under Raffaelle, and modelled his style upon that of the great master. His numerous works—sacred subjects with a few portraits—are for the most part in Milan. His 'St. Paul in Meditation' at Paris, his 'Martyrdom of St. Catherine,' and his magnificent 'St. Jerome' at Milan are his *chefs-d'œuvres*. F. died at Milan in 1550. His composition is noble, his expression animated and true, his drawing correct, and his colour extremely gay, though somewhat deficient in harmony and tone.

Ferré, Théophile Charles, originally a merchant's clerk, but afterwards a fierce Communist, was born in 1845. He became in turn member of the commission of public safety, adjunct procurator general, and prefect of police. At the massacre of hostages in May, 1871, he took the chief part and caused the inmates of the penitentiary to be released and armed and to act as the executioners. Opportunity alone was the limit to his excesses. He was executed in November, 1871.

Ferrei'ra, Antonio, 'the Portuguese Horace,' was born at Lisbon in 1528, studied law at Coimbra, where he became a professor, afterwards held an office at the court of João III., and was cut off by the plague in 1569. F. was a zealous student and imitator of the Greek and Latin poets, especially of Horace. His works, which include sonnets, odes, elegies, epistles, and dramas, are marked by depth of thought and graceful conciseness of diction, and belong to the Portuguese *classic* school. F. is particularly happy in his *Cartas* or epistles. His play *Inez de Castro* was the second tragedy written in Europe after the revival of letters, and his *Cioso* was the earliest comedy of character written in Portugal. F.'s *Poemas Lusitanas* were published at Lisbon in 1598; all his works appeared at Lisbon in 1771. See Sismondi's *La Littérature du Midi* (Par. 1813).

Ferr'et, a species of Carnivorous Mammalia nearly allied to the polecats, weasels, &c., and included with these in the Digitigrade (q.v.) family *Mustelidæ*. The F. is employed chiefly in the extermination of rats and other vermin, and for hunting rabbits, its active lithe movements and its carnivorous propensities suiting it admirably for its work. The exact nature of the F. species or breed has been much disputed. Most naturalists agree in considering the F. to be an albino variety of the polecat, while a few have maintained its specific identity. The polecat and F. will breed together, but the latter appears to require a warmer climate than the former. The F. is said to have been originally brought from Africa. The common F. is the albino-like animal already alluded to, with a creamy-white body and pink eyes. The polecat-F. is larger and dark coloured. Both are very persistent and ferocious, especially if irritated. They breed twice annually, and produce from six to eight or nine young at a birth.

Ferret.

Ferricyan'ogen is the name given to a compound radical (or group of elements which can be transferred from one compound to another).

The radical itself cannot be isolated, its compounds alone being known. Of these, the ferricyanide of potassium is the most important. This salt is prepared by the action of chlorine on ferricyanide of potassium, and differs from the latter only in that it contains an atomless metal.

Ferricyanide of potassium crystallizes in large prismatic bubbles, which are of a beautiful ruby-red colour. It is employed in the manufacture of *Turnbull's blue*. This compound is precipitated on mixing solutions of protosulphate of iron and ferricyanide of potassium, and when pure it is the ferricyanide of iron or ferrous ferricyanide. F. contains the element iron and the group of elements called cyanogen, but neither of these can be recognised in it by the ordinary test.

Ferr'ier, James Frederick, a subtle and strong metaphysician, was born at Edinburgh, November, 1808. Educated at Oxford, where he took the degree of B.A. in 1832, he was called the following year to the Scotch bar, but did not practise. He became known in literature first as a contributor of articles, chiefly on metaphysical subjects, to *Blackwood's Magazine*, and his election to the chair of history in the University of Edinburgh in 1842 was followed in 1845 by his appointment to the professorship of moral philosophy in the University of St. Andrews. F.'s magazine 'studies' formed the basis of his *Institutes of Metaphysics, a Theory of Knowing and Being*, published in 1854, which, though cast in a mathematical form, has occasional bursts of radiant humour and paragraphs of the rarest literary beauty. It is on the whole the most keen and luminous exposition of Berkeleian idealism in the English tongue. In 1855 F., who had married a daughter of Professor John Wilson, published the collected works of his father-in-law. He died 11th June, 1864. His *Lectures on Greek Philosophy*, and other philosophical remains, were published in 1864, under the editorship of Sir Alexander Grant and Professor Lushington.—**Susan Edmonston F.,** aunt of the preceding, and sometimes called 'the Scottish Miss Edgeworth,' was born in Edinburgh in 1782, her father, James F., being, like Sir Walter Scott, one of the principal clerks of the Court of Session. S. E. F. was herself on intimate terms of friendship with the great novelist. She first gained favour by her novel of *Marriage* (1818), which is rich in humour and in genuine portraits of Scottish character, although they occasionally verge on caricature. Her other works are *The Inheritance* (1824) and *Destiny* (1831), marked by the same enduring excellences as *Marriage*. Miss F. died 7th November, 1854.

Ferr'o (Span. *Hierro*), the most westerly and the smallest inhabited island of the Canaries (q.v.) which belong to Spain, and for administrative purposes are considered part of Spain. Area, 82 sq. miles. It attains a height of 3500 feet. is fruitful, but deficient in water. The chief place is the village of Valverde on the N.E. coast. All geographers at one time reckoned longitude from F., and maps are still constructed on this principle in Germany. Pop. 5897.

Ferrocyan'ogen is usually represented as having the same composition as ferricyanogen; but its salts differ from those of the latter compound, in that they contain more metal. The most important compounds of F. are its potassium, iron, and copper salts. The first of these is obtained by heating animal refuse—horn, blood, clippings of hides, &c. —with carbonate of potash and scrap iron. The resulting mass is dissolved in water, filtered, and evaporated to crystallization. Ferrocyanide of iron, or *Prussian blue*, is prepared by mixing solutions of a persalt of iron and ferrocyanide of potassium. Ferrocyanide of copper is called *Hatchett's brown*, and is also largely employed as a pigment; it is obtained by mixing solutions of sulphate of copper and ferrocyanide of potassium. Neither the iron nor cyanogen present in F. can be detected by the ordinary tests.

Ferr'ol (Span. *farol*, 'the beacon'), a fortified seaport in the province of Coruña, Spain, 12 miles N.E. of the town of Coruña, on a neck of land on the N. shore of the Bay or *Ria* of F., is a large naval arsenal of Spain. The entrance to the harbour is so narrow that only a single ship of the line can pass at a time, and it is defended by the castles of San Felipe and Palma. The land side was fortified in 1769-74 with a wall on which 200 cannon can be mounted. Fifteen ships of the line could be built in F. at the same time. F. has manufactures of sailcloth, ropes, and leather, and exports pickled herrings and sardines, wine, brandy, and corn. The arsenal and dockyards cover over 24 acres. Pop. 6089.

Ferro'type, a photographic process published in 1844 by R. Hunt, whereby paper is sensitised by means of succinic acid, common salt, gum-arabic, and nitrate of silver; the image being developed by photosulphate of iron, and fixed by hyposulphite of soda. In the United States of America cheap photographs on tin have been called by the same name.

Ferru'ginous (from Lat. *ferrum*, 'iron'), a term in geology applied to rocks and soils which contain large quantities of red iron oxide. Its presence is easily recognised by the brownish-red colour which prevails.

Ferr'y (from Old Eng. *faran*, 'to move'; *cf.* Lat. *fero*), in law, is a right by prescription or by license from the Crown or by Act of Parliament to keep a passage-boat on water, and to make a reasonable charge for the conveyance by it of passengers or goods. The right prevents another from setting up another F. in the same neighbourhood. It is not essential to a right of F. that the possessor should be the proprietor of the land on either side. By 8 & 9 Vict. c. 45, certain rules are laid down for the regulation of ferries, and by the Land Clauses Act the owner of the right is debarred from compensation when the traffic ceases or decreases owing to competition by a railway bridge.

Fertil'ity is the capability of producing progeny. This capability varies very much in the animal kingdom. A mode of estimating F. would be to note the number of real progeny resulting. This can rarely be done, but it may be stated generally that the number of the progeny stands in a certain relation to the mean duration of life of the species. The greater the mean duration of life the less will be the F., and *vice versâ*. The F. of the human being is affected by social influences and habits in a manner at present not understood. The actual descending F. of animals also varies considerably. This F. of the human being may be reckoned to be one in one year, whereas in the case of the mouse it is estimated at 43,000 in the same period; that is, the human parent at the end of twelve months remains simply the parent, whereas the mouse parent may by the end of a year be raised to the proud position of ancestor of a numerous progeny in the first to the seventh degree. Yet this power of reproduction is insignificant when compared to that of the members of the lower animal-vegetable kingdom, where the offspring becomes a parent of ten descendants in less than ninety seconds after birth.

Fescenn'ine Verses (from Lat. *fascinum*, 'a bewitching,' as they were supposed to be a protection against witchcraft) were the earliest attempt at versification made by the inhabitants of Italy. They were a rude kind of dramatic satire, in which the interlocutors ridiculed one another, and they were accompanied by music and dancing. In course of time they became malicious and libellous in character. At first they were confined to rustic gatherings, especially after harvest, but were subsequently introduced, probably in a more refined form, into the towns. It is a common error to suppose that the F. V. were of Etrurian origin, and that the name was derived from Fescennia, an Etrurian town.

Fesch, Joseph, Cardinal, an eminent ecclesiastic, who from the marriage of his father to the grandmother of the First Napoleon was considered uncle of the latter, was born at Ajaccio, 3rd January, 1763. He was educated for the Church of Rome, but entering into the spirit of the French Revolution, served in the army under General Montespan as storekeeper. When his nephew resolved to revive the Roman Catholic worship in France and to gain the favour of the Pope, he made use of F., who returned to his original profession, and proved himself an adroit and successful ecclesiastic. In 1802 he became Archbishop of Lyon; in 1803 he obtained a cardinal's hat; and in 1804, while ambassador at Rome, he induced the Pope to consecrate Napoleon as emperor. F., however, was too staunch a Churchman to approve of the policy which his nephew pursued towards the Pope; he declined to be made Archbishop of Paris; Eugène Beauharnis was preferred to him for the primacy of the Confederation of the Rhine, which he had been promised; and he retired with his half-sister Letitia to Rome. His later years were embittered by the persecutions of the Legitimist clergy, who compelled him to resign his charge. F. died 13th May, 1839, leaving behind him one of the largest collections of paintings ever made by one person. See *Le Cardinal F., Fragments Biographiques* (Lyon 1841), and *La Vérité sur le Cardinal F.* (Lyon 1842). Napoleon's Correspondence with F. was published by Du Casse (Par. 1855).

Fes'cue, a genus of Grasses represented by various characteristic British species, and possessing spikelets with many flowers or florets, each floret having two lanceolate paleæ. The meadow F. attains a height of 2 or 3 feet and is common in meadows and pastures in Europe, N. America, and N. Asia. The panicle in this species is of spreading form, and the spikelets are arranged in linear fashion. Spiked F. has the branches of the panicle represented by a single spikelet, and has a *raceme* arrangement of florets, or two-rowed spikes. It is otherwise nearly allied to the former species. Hard F. grows well on dry soils, and has a shortened panicle. Creeping or red F. is allied to the preceding species, and is also of hardy nature. A smaller species is sheep F., most common in hilly districts. Tall F. may attain a height of 4 or 5 feet. It grows most profusely in moist soil, and near rivers and lakes. The heterophyllous F. is a native of the Continent, but has been cultivated with success in Britain; and the F. of Peru is used in that country for thatching roofs.

Fesse, in heraldry, one of the honourable ordinaries, is formed by two parallel lines drawn horizontally across the centre of the shield, so as to contain two-thirds, and is regarded as an emblem of the military girdle worn by mediæval knights. *Fess-point* is the centre of the shield; *F.-wise*, placed like a F.

Fess'enden, William Pitt, was born at Boscawen, New Hampshire, U.S., 16th October, 1806. He graduated at Bowdoin College in 1823, established himself as a lawyer in Portland, Maine, in 1829, and soon acquired a high reputation in his profession. F. entered political life as a Whig, and was elected to the state legislature in 1832. In 1841 he was sent as representative to Congress; entered the United States Senate in 1854, and signalised himself by an able speech against the Nebraska bill. He became a leading Republican, and as chairman of the finance committee rendered invaluable service during the war. In 1864 he became Secretary of Treasury, but returned the following year to the Senate, where he voted for the acquittal of President Johnson. After suffering long from ill-health, he died 8th September, 1869. F. was an eloquent debater, a skilful tactician, an able statesman, and a man of strict probity and honour.

Fes'tival Plays. See MYSTERIES, MORALITIES, AND MIRACLE PLAYS.

Festivals are, speaking generally, holy-days or 'solemn assemblies celebrated by cessation from labour, by sacrifices, feasting, dancing, singing, or any other sign of joy.' They have been instituted chiefly from four causes:—First, in honour of the gods, for offering sacrifices and praises to them, out of gratitude for benefits received; secondly, in order to propitiate the gods, so as to obtain some particular blessings or deliverance from evils under which men were labouring; thirdly, in memory of deceased patriots or public benefactors; and fourthly, as times of rest and recreation to labourers. Perhaps the earliest of all F. were those connected with agriculture, as after harvest or vintage, when men rejoiced over the fruits they had gathered, eating and drinking plentifully. Astronomical phenomena would also be early observed, such as the moon's changes, the summer and winter solstices, &c., and F. celebrated in connection with them. Such celebrations have always had great attractions for primitive, half-civilised peoples, and have been of universal prevalence. The nation which was specially noted in ancient times for its attention to F. was the Egyptians, from whom probably the Greeks derived theirs to a great extent, the Romans again deriving theirs from the Greeks.

Greek and Roman Festivals.—The four great solemn F. of Greece were the Olympic, Pythian, Isthmian, and Nemean. The following, from their importance, also deserve notice:—The Adonia, in honour of Venus and Adonis; the Apaturia, of Bacchus; the Brauronia, of Diana Brauronia; the Dionysia, of Bacchus; the Eleusinia, of Ceres and Proserpine; the Thesmophoria, of Ceres the lawgiver; and the Panathenaia, of Minerva. F. to the same god were held in different localities, as the Apollonia at Sicyon, the Carneia at Sparta, the Daphnephoria at Thebes, the Delia at Delos—all in honour of Apollo. The Androgeonia and the Arateia (after Androgeus and Aratus) are examples of the numerous F. instituted in honour of heroes. The Romans freely enriched their mythology by foreign additions, but their F. were not at all so numerous as the Greek, never, indeed, having amounted to more than a hundred. The Epulum Jovis was held on the 13th November; the Matronalia, in honour of Juno, on the 1st March; the Quinquatrus, of Minerva, on the 19th March; and the other great gods were similarly honoured. Other notable sacred F. were the Cerealia, in honour of Ceres; the Consualia, of Consus, the god of secret deliberation; Matralia, of Mater Matula, or Aurora; Lupercalia, of Lupercus, the god of fertility, &c., &c. The Larentalia, in honour of Acca Larentia, nurse of Romulus and Remus, is an example of the F. that commemorate historical personages or events. Among the Romans, public games in the earlier ages were always regarded as religious rites. The chief athletic sports were the races, the mock fight (called the game of Troy), sham battles, sea-fights, and wild beast hunts.

The Hebrew F. may be divided into the Mosaic and post-exilian. 1. *Mosaic.*—The former are all connected with the sacred astronomical number *seven* (see WEEK), especially a series directly counted by sevens: (1) the Sabbath (q.v.) of Days; (2) the Sabbath of Weeks (see PENTECOST, FEAST OF); (3) the Sabbath of Months, kept on the first day of the 7th month (Tishri) as the beginning of the New Year, and called the Feast of Trumpets (Lev. xxiii. 23-25; Num. xxix. 1-6); (4) the Sabbath of Years, kept every seventh year as a year of remission (Exod. xxiii. 11; Lev. xxv. 1-7); (5) the Sabbath of Sabbath-years, kept every seven Sabbath-years, and called the year of Jubilee (q.v.). Besides these there were—(6) the Feast of the New Moon, kept at the beginning of every month, to connect the reckoning of weeks with the lunar month (Num. x. 10, xxviii. 11-15); (7) the Passover (q.v.), which had two real festival ('holy convocation') days—the first and seventh—and which was connected with the beginning of the harvest; (8) the Great Day of Atonement, on the 10th of the 7th month, which was a *fast* as well as a festival (Lev. xvi., xxiii. 26-32; Num. xxix. 7-11); (9) the Feast of Tabernacles (q.v.), or of the ingathering of the harvest; and (10) the feast which follows immediately on the Feast of Tabernacles, on the 23rd Tishri (Num. xxix. 35-38). The annual F. also made up the sacred number seven, with their days of 'holy convocation' (*two* Passover, one Pentecost, Trumpets, Atonement, Tabernacles, and concluding festival), and of these seven the Great Day of Atonement was pre-eminent as the 'Sabbath of Sabbaths,' as the ordinary Sabbath was pre-eminent among the seven days of the week.

2. *The post-exilian* F. were all annual, and in their order in the year were as follow:—(1) The Feast of Acra, instituted by Simon Maccabæus, B.C. 141, and held on the 23rd of the 2nd month, in commemoration of the capture of Acra and the expulsion of the Hellenists from Jerusalem; (2) the Feast of Wood-carrying, kept on the 15th of the 5th month from the time of the return from Babylon (Neh. x. 35); (3) the Feast of Water-drawing, held on the 22nd of the 7th month, the last day of the Feast of Tabernacles (*cf.* John vii. 37); (4) the Feast of Dedication (beginning on the 25th of the 8th month, and lasting eight days), instituted by Judas Maccabæus in commemoration of the purifying of the Temple (1 Macc. iv. 52-59; Jos. *Ant.* xii. 7, 7); (5) the Feast of Nicanor, instituted by Judas Maccabæus, and held on the 13th of the 12th month, in commemoration of the victory gained over Nicanor (1 Macc. vii. 49; Jos. *Ant.* xii. 10, 5); (6) the Feast of Purim, on the 14th of the 12th month, in commemoration of the deliverance of the Jews related in the Book of Esther (*cf.* iii. 7, ix. 20-28).

During the first few years of the existence of the Christian Church many of the Jewish F. were doubtless observed. As time went on the influence of Judaism diminished, and all Jewish F. were rejected except those which had been Christianized. At the end of the 2nd c. there is no evidence of the existence of any other Christian F. than the Sabbath or Lord's Day, the Passover—observed as Good Friday (q.v.)—and Easter (q.v.), and Pentecost (q.v.). But gradually other F. were adopted, perhaps a good deal owing to the analogy of other religions. The earliest of these was Epiphany (q.v.), and then Christmas (q.v.) came to be observed as a separate festival. Ascension Day (q.v.) began to be observed in the 3rd or 4th c., and the F. of the Presentation—Candlemas (q.v.)—and Annunciation in the 6th c. A very fruitful source of F. was the observance of the anniversaries of martyrs' deaths, reckoned as their birthdays (*i.e.*, their entrance into life), of which kind there was a widespread observance by the end of the 4th c. At first these saints'-days had only a local celebration, but in course of time those of the more eminent saints were celebrated by the whole Church. In the 7th c. a festival was instituted in honour of the Cross. At this time also (610), Pope Boniface IV., having got a gift of the Pantheon at Rome, which had been dedicated to Cybele and all the gods, dedicated it to the Virgin Mary and all the holy martyrs, and instituted the festival of All Saints (q.v.), which, however, had been observed in the Eastern Church from the 4th c. To this was added in the 10th c. the festival in memory of all departed souls.

The F. of the English Church are 149 in number (including Sundays):—Sixty-three in honour of Christ, three of the Holy Ghost, one of the Trinity, one of the angels, five of the Virgin Mary, and seventy-six of saints. As the day on which Easter falls varies from year to year, those F. which depend upon Easter—Septuagesima, Rogation Sunday, Ascension Day, Whit-Sunday, Trinity Sunday, Ash-Wednesday—are also 'movable feasts.' See C. D. Ginsburg in Kitto's *Cyclo. of Bib. Lit.* (Edinb. 1863); Smith's *Dict. of Christ. Ants.* (Lond. 1875); Blunt's *Annotated Book of Com. Prayer;* Bingham's *Ecclesiast. Antiquities.*

Festoon', an architectural ornament, frequently occurring on the friezes of Roman and Renaissance buildings, and consisting usually of wreaths of flowers and fruit, alternating with heads of animals. In modern architecture the F. is much used as a decoration for cornices, panels, &c.

Fes'tus, Sex'tus Pompei'us, who is supposed to have lived in the 3rd or 4th c. A.D., was the compiler of a valuable work in twenty books, entitled *De Verborum Significatione.* This work was a dictionary of notable Latin words, and consisted chiefly of an abstract of the *De Significatu Verborum* by Valerius Flaccus, an eminent grammarian of the time of Augustus. The epitome of F. was still further abridged by Paulus Diaconus, towards the close of the 8th c. Only one MS. of the work of F. has survived, the numerous blanks in which were filled up by Scaliger and Ursinus from Paulus, and from conjecture.

Fesz'ler, Ignaz Aurelius, a Hungarian novelist and historian, born at Czorendorf in July, 1756, joined the Capuchins, but afterwards became a Protestant, was reader to the Emperor Joseph in 1784, and from 1785-87 Professor of Oriental Languages at Lemberg. Being accused of atheism, he betook himself to Silesia, and finally to St. Petersburg, where he received the chair of Eastern languages in 1809, and died 15th December, 1839. He wrote various novels, treatises, &c.; but his chief works, which are all in German, are *Marc-Aurel,* a romance (1790-92), *Mathias Corvinus* (1793), *Attila* (1794), and *Geschichte der Ungarn* (Leipz. 1812-25). F. was a deep scholar and graceful writer.

Fetia'les. See FECIALES.

Fe'tichism, meaning the worship of fetiches (*fetich* is a corruption of the Portuguese *feitiçâo,* 'magic,' from the Lat. *ficticius,* 'what is feigned,' or perhaps from *fatidicus,* 'fate-telling'), is the first form of belief in the supernatural adopted by men altogether uncivilised. It is purely a worship of nature, the fetiches being natural objects, such as beasts, birds, reptiles, fishes, insects, trees, mountains, lakes, rivers, gems, metals, meteoric stones, the sun, moon, and stars, the earth, sea, and air, as well as artificial imitations of natural objects, which are credited with having a supernatural influence, and are appealed to by sacrifices and prayers against sickness, drought, &c., to cure insanity, barrenness, &c., to give rain, good crops, successful hunting, fishing, &c. The lowest form of F. is seen in what is also the first form of natural magic, when every man has his own amulet to protect him from all harm, and grant him all the success he desires in his occupation, being thus, at the same time, his own priest. Then family or household fetiches (teraphim, lares, &c.) are adopted, and the head of the house is the priest; or if wealthy, like Micah, 'the man of Mount Ephraim' (Judges xvii.), keeps a private chaplain. One step farther gives fetiches for the tribe, and a regular priesthood—medicine-men, rain-makers, jugglers, &c. The transition stage from F. to Polytheism is seen in the religion of the ancient Egyptians, with their unbounded use of amulets, and also their adoration of animals, or human forms with animals' heads, which were symbols of different attributes of deity. F. is systematized in the Shamanism (q.v.) of Tartary, and the Lamaism (q.v.) of Tibet and Mongolia.

Fe'tid Lime'stone, called by the Germans *stinkstein,* is the name given to certain kinds of limestone, which, when struck with a hammer, emit a fetid odour, like that of sulphuretted hydrogen—a result probably of the decomposition of animal matter. In the carboniferous limestones of Ireland such rocks are of frequent occurrence.

Fet'lock, or **Fett'erlock,** was at first probably an instrument fastened to a horse's leg to hinder his escape. It is the name for that part of a horse's leg where a tuft of hair grows behind the pastern joint. In heraldry it is represented by a short rounded bar, to which a semicircular steel band or chain is fixed.

Feu (Low Lat. *feudum,* lit. 'land held on feudal tenure,' from the same root as *fee, i.e.,* Old Eng. *feoh,* 'cattle,' 'goods'), a term of Scotch law denoting a sale of land for a stipulated annual payment, called the *F.-duty.* The deed of conveyance is called a *F.-contract,* or a *F.-charter,* there being some legal difference as to the mode of enforcing the two. The F.-contract, like other titles to land, has been simplified by the Titles to Land Act of 1858. A F.-duty is heritable, but an arrear is moveable. It is a *Debitum Fundi* (q.v.), and in addition to his personal action, in the event of non-payment the superior may *poind* the ground. (See POINDING.) He has also a real right in the land, and consequently a preference over purchasers and creditors. He has also a *hypothec* (lien) over the crop for the last or current F.-duty. Sometimes the stipulation is for payment in grain, in which case the quantity agreed on is valued according to the *Fiar* (q.v.) prices of the year, and the payment is made in money accordingly. But most modern feus are payable in money. Proprietors of land in Scotland near towns, manufacturing villages, or places of summer resort, are generally glad to add to their income by feuing ground for building purposes. F.-duties, being usually a very safe investment, bring a high price in the market, usually from twenty-two to twenty-three years' purchase, thus yielding a return of about 4½ per cent. The system of building on F. tenure possesses considerable advantages over the English system of long leases. The tenure being perpetual, the holder is probably led to erect more substantial buildings than he would otherwise do, and Scotch houses are accordingly remarkable for durability and warmth. From the Montgomery Act of 1770 down to the Entail Act of 1882 the legislation has favoured the relaxation of the severity of the law of entail, and now an heir of entail in possession may, amongst other things, feu out the entailed estate and grant long leases, provided he obtain the authority of the Sheriff or Court of Session for so doing. There is another kind of F.-duty called a *Ground Annual* (q.v.). For England see GROUND RENT.

Feud (Old Eng. *faehdth*, 'enmity,' 'deadly quarrel,' from *fian*, 'to hate'; *cf.* Frisic *faithe*, Dutch *veede*, Ger. *fehde*, Dan. *fejde*) was at first the war waged by the kindred of a murdered man to revenge his death, and then was applied to any strife between different clans or families, in the times before private disputes were settled by law. The word has no connection with 'feudal' or 'feudalism.'

Feu'dalism (for derivation see FEU), the principle of holding land by military tenure which prevailed during the Middle Ages. The Roman republic granted land to be held by military service, the holder being subject to the state; and after the Goths seized the Roman empire this Roman custom was united with the Gothic custom of devotion to a personal chief, and men received lands from their kings and leaders on condition that they gave their services in war. Land thus granted by a Gothic king was called a *feudum* or *fief*, and was held by *feudal* tenure; while lands which were not held of any lord were said to be held by *allodial* tenure, *allodial* being either the Latinised form of the Teutonic *odal*, 'noble' (*cf.* Mod. Ger. *adel*), or a derivative from the Teutonic *loos*, 'a lot.' Besides feudal and allodial tenures, there was a feudal relation called *commendation*, which Hallam compares to the Roman relation of patron and client, and by which a vassal promised military service in return for the protection of a powerful lord. The great chiefs, who admitted only a very slight supremacy on the part of the king, bestowed parts of their lands as fiefs, also on condition of military service, and these fiefs or benefices were again divided in subinfeudations. Gradually all the land in several countries was held by feudal tenure, but there never was a definite organized *feudal system*. 'Every one,' says Freeman (*Essays*, 2nd series), 'should be on his guard against believing that any such thing as a "feudal system" ever existed anywhere.' F., instead of being imposed as a uniform *system* upon the several European countries, grew up slowly and with great modifications in different lands, according to their previous history and the character of their inhabitants, and in no country was it largely developed before the 10th c. It was at first understood that the king could at will resume the great fiefs, but these were soon regarded as life-holdings; and after Karl the Bald, by the Diet of Chiersi in 877, gave his *leudes* or chief vassals hereditary possession of their benefices, allodial tenures lost their importance, and gradually changed into feudal fiefs, the protection of a strong over-lord being preferable to the perilous independence of an allodial landholder. Before the end of the 11th c. most allodial tenures were extinct, except in the S. of France. There was no clearly recognised hierarchy of landholders, but each feudal country may be said roughly to have been held by the king, the great vassals, and then the lords, barons, and lower vassals. The king was nominally lord of the whole country, but had a very lax control over his great feudatories, his real power being generally limited to his particular territories, which were granted to smaller holders in the same manner as were the fiefs of the great nobles. It was at one time held that the vassals of a feudal lord were not the 'men' of the king, but simply the 'men' of their over-lord, and that if an over-lord warred against the king, his vassals could support him without being guilty of treason. These doctrines were in great measure the cause of the temporary breaking up of the French monarchy, and of the prolonged disintegration of Germany. One man became the vassal of another by paying *homage* (Lat. *homo*, 'a man'), which consisted in his placing his hands in those of his lord and swearing to be his 'man,' and to aid him in war. The principal obligations of a vassal were *service in war*, each feudatory being bound to serve forty days, or if he were a *homo liguus—i.e.*, bound by a special arrangement—till the end of the war; *justitia*, the necessity of appearing to judge or be judged at his lord's court, a duty which, however, was generally discharged by proxy; *auxilia*, the obligation of paying sums when his lord had to be ransomed or went on a crusade, and when his lord's eldest or only son was knighted, or his daughter married. When the heir of a fief was a minor, the lord-superior was his guardian. If the ward was a female, the over-lord could propose a husband to her; and if she refused the suitor, she had to pay her feudal guardian as much as any one would give him for the right of marrying her. The over-lord was also entitled to payments from his vassals on their inheriting lands, or on the alienating of a fief, but this seldom happened, as the right of alienation was a privilege opposed to the spirit of F. which was only slowly won by the humbler vassals. The relation of vassal and superior could be severed by the ending of the superior's line, or by the violation of the feudal oath taken when the vassal did *homage*. When women held fiefs, they had to find substitutes to perform military service. From the 4th to the 10th c. the clergy were looked on as a privileged class, and were free from any feudal burdens, but after the 10th c. they were made liable to military service for their estates, unless they purchased immunity, or held their lands by *frank almoigne*, *i.e.*, by saying masses for their superior's family. As the churchmen were often unable to guard their possessions, they generally obtained the protection of a noble, called their *advocate*, who was recompensed by lands or money. After the Church became feudalised, the clergy, as holders of fiefs, were considered to be the king's vassals; and as the Pope maintained that they were independent of the monarchy, struggles arose on this point between the regal and papal powers. Beneath the feudal landlords, lay or clerical, were the *villeins* and serfs, the original inhabitants of the countries conquered by the Gothic tribes. The *villeins* (Lat. *villanus*, 'one belonging to a *villa* or district') were small farmers bound to the soil (*ascripti glebæ*), who paid heavy rents, and could not leave the estates in which their farms lay. The serfs were miserable slaves, who had no common country, and almost no communication with each other, having no connections beyond their lord's territory. Towards these villeins and serfs a feudal chief stood in a different relation from that borne by the head of a clan towards his followers, the chief of a clan having a common lineage and common traditions with his dependents, while the feudal ruler and his inferior tenantry and serfs were quite alien from each other. F. varied greatly in different countries, some being far more thoroughly feudalised than others. Thus in France it was ruled that the eldest son should inherit all his father's lands, while in Germany fiefs were generally divided among all the last holder's male offspring. In France there were soon very few allodial tenures, while small freeholders were long numerous in Germany. The French fiefs early became hereditary, but it was not till the reign of Heinrich II. (1002-24) that the great German nobles were allowed to transmit their lands to their children. In Germany, partly from fear of invasion, considerable power was at first entrusted to the kings, who in the 9th and 10th centuries were actual rulers, while the contemporary French monarchs had only a nominal superiority. The German vassals were at first less independent than the French, but after the German monarchy became elective, the regal power sank in Germany, while it rose steadily in France. The decline of the kingly power and the continued existence of small fiefs made F. endure longer in Germany than in any other country. In the N. of France, where there was no regular law after the breaking up of the Roman empire, F. was early and fully developed, while in the S. of France it was greatly modified by Roman law and a riper and fairer civilisation. France N. of the Loire was called *Pays du droit coutoumier*, 'the land of customary law'; France S. of the Loire, in which F. was only firmly established in the beginning of the 13th c., after the Albigensian crusade, being styled *Pays du droit écrit*, 'the land of the written or Roman law.' In the 10th c. there were in France 70,000 separate fiefs, of which 300 gave titles to their holders, and many were almost independent states, their rulers levying taxes, legislating, and administering justice at their own will.

The beginnings of F. in England can be traced before the Conquest. The thegns held lands from the king by military service, and practised subinfeudation before the reign of William the Conqueror, who, however, greatly strengthened the custom of holding land by feudal tenure from the Crown, while he checked the growth of F. as a system of government, and withstood its tendency to break up a kingdom. He prevented it from developing as it did in France by retaining the old English legislative, judicial, and administrative constitution; by preserving the courts of the shire and hundred, which were open to all freemen, but were subject to the decisions of the royal judicial assembly. In the 12th c. the royal power was far stronger in England than it was in France; and F. was also weakened in England by the national council, by the great mass of freemen, who neither ranked with the Norman nobles nor had lost their lands and sunk into villeinage, by the nobles' estates being smaller and more scattered than those in France, and by the fact that most of the English estates were granted as rewards to his followers by William, whereas in France the great nobles had held their lands before the accession of Hugo Capet. The English nobles never had the rights of private war and of coining, and being far feebler than the Continental lords, leagued with the people against the Crown. F. in England came to an end after the Wars of the Roses, in which many of the old nobility perished. F. was brought into Italy in the time of the Karolings, but was unsuited to the genius of the people. F. in Italy was always an exotic, which faded with the rise of the commonwealths, and had greatly vanished before the close of the 12th c., though feudal rulers shone with a transient brilliancy in the N. and S. of the land. Feudal tenures were introduced into Spain at a very late date, and, except in Aragon, had no strong effect on Spain. Neither did F. leave any impress on Hungary or on the N. of Europe. Feudal principles did not prevail whereever the feudal form was found. The kingly power, the Church, and the cities, though they seemed to conform to F., were always its foes at heart, and clung to the monarchic, ecclesiastic, and democratic principles. As the kingly power gradually rose and leagued itself with the communes, as Roman law was restored, as the universities brought together men from different countries and broke down the old severance of nation from nation, F. gradually died away. It was greatly weakened in the 12th and 13th centuries by the battles of Mansourah, Courtrai, Crecy, and Poitiers, in all of which the French nobles were severely defeated. Money payments (*escuages*) began to be taken instead of military service; wider ideas were introduced by the Crusades; the strength of the great feudatories was sapped by their mutual strifes; a new mode of warfare was necessitated by the use of gunpowder; the superiority of infantry to feudal cavalry was finally proved by the battles of Agincourt, Granson, and Morat; and before the end of the 15th c. F., as a system of government, had well-nigh disappeared. 'F.,' says Guizot, 'is perhaps the only tyranny which men have never been willing to endure. They have willingly yielded to monarchic and theocratic despotisms; to F., never.' F. seems to have been at first almost indispensable for restoring something of social order to Europe; but it established no legal bonds, no political rights; it isolated man from man, and nation from nation, fostered private strifes, and ruined national unity and patriotic feeling. It transferred the governing power in great measure from the towns to the country, being intensely opposed to the spirit of civic life, and substituting personal for political relations. It only admitted the right of individual resistance in the case of the nobles, and offered no recognised place of appeal to such as could not redress themselves by force. Though a kind of rude federative principle ran through F., it was impossible to carry it into effect, the seignorial courts being very seldom held and of very slight influence. In its infancy it served to check invasion, and restored a harsh iron order in the place of chaos; while from the feudal lord being almost cut off from society, it gave a new importance to family life, and consequently improved the social position of women. See Guizot's *Hist. de la Civilisation en l'Europe*, and Hallam's *Middle Ages*.

Feu-de-Joie (Fr. 'joy-fire') is strictly a fire lighted in the streets or public squares on occasions of general rejoicing—a bonfire. The English use of the term is to denote a 'running fire' of musketry, when troops in line fire rapidly in succession, beginning from the right-hand man of the line, so that the effect is an uninterrupted, rolling discharge. The F.-de-J. is fired in commemoration of victories, in honour of distinguished persons, &c.

Feu'erbach, Paul Johann Anselm von, born at Jena, 14th November, 1775, devoted himself to the study of positive law, on which he lectured at Jena. In 1798 he published his *Anti-Hobbes* (on the limits of the civil power) and his *Untersuchungen über das Verbrechen des Hochverraths*. He soon became the head of the 'Rigorist' school, who maintain that in the administration of criminal law nothing should be left to the discretion of the judge. The importance of this position is very great, for nothing shakes the authority of law more than manifest inequality of punishment. Hence the attempts made in countries without codes to codify the penal law. On the other hand it is maintained that within certain limits the discretion of the judge may give effect to circumstances which the law cannot well define beforehand. The danger of the Rigorist principle is especially seen in the case of cumulative punishments for a series of offences. The chief work of F.'s life was the drafting of the Bavarian Penal Code of 1813. This code modified those of Saxony, Hanover, Würtemberg, and of four of the Swiss Cantons. F. died at Frankfurt, 29th May, 1833. His best-known book is the collection of *Merkwürdige Criminalfälle* (Giess. 1808-11), translated into English by Lady Duff Gordon, in which he explains and criticizes the system of seclusion and mental torture by which the law endeavoured to extract a confession from prisoners, even after conviction on circumstantial evidence, for the purpose of justifying the infliction of capital punishment. F. had several sons, who became distinguished in archæology, law, Oriental science, and mathematics. **Ludwig Andreas F.**, son of the preceding, was born at Landshut, 28th July, 1804. Under the theological and philosophical influences of Paulus at Heidelberg and Hegel at Berlin, he soon went further than his masters from the orthodox schemes of thought. Schleiermacher had analyzed emotional religion into a feeling of complete dependence on the universe of God. F., not content with demolishing the modes of thought which rest on sacrifice and prayer, attacks this feeling of dependence so far as it implies anything beyond the calculated result of human work, invention, culture. God is what man wishes to become. If he looks to God for what he wishes to get apart from his own striving, he loses the only true religion. The religion which consists in wishing, and trusting to an invisible power, is a perversion of human nature.

Hence F. looks with disgust on the lamentations of Christians over their sins, on the privations of monastic life, on self-sacrifice for its own sake, and that wisdom of the Cross which is opposed to the wisdom of the flesh. His chief work, *Das Wesen des Christenthums* (1841; Eng. trans. by George Eliot, 1871), is defiant and extravagant in its tone. He died at Nürnberg, 12th September, 1872.

Feuill′ans, the name of a reformed brotherhood of Cistercians founded in 1577 by Jean de la Barrière. The monastery of the order in the Rue St. Honoré, Paris, gave its name during the Revolution to a political club founded in 1790 by Lafayette, Sièyes, La Rochefoucald, &c., who at first named their association the 'Society of 1789,' but afterwards, from the circumstance of their holding their meetings in the monastery of the F., were named F. The club advocated moderate and constitutional opinions in opposition to the Jacobins; but the latter rising in popular favour, the former came to be regarded with suspicion, and on the 28th March the club was violently suppressed by the populace.

Feuill′et, Octave, a French novelist, was born at St. Lô in Manche, 11th August, 1812. He was educated at the College of Louis-Le-Grand in Paris, and appeared for the first time as a writer in the columns of the *National* (1845). Afterwards he sent forth an incredible number of tales, of which the best known are *Rédemption* (1849), *Bellah* (1850), *Le Cheveu Blanc* (1853), *La Petite Comtesse* (1856), *Le Roman d'un Jeune Homme Pauvre* (1858), *Histoire de Sibylle* (1862), *M. de Camors* (1867), and *Un Mariage dans le Monde* (1875). These are mainly distinguished by skilfully entangled plot, somewhat ambiguous morality, richly poetical descriptions, and lively satiric sketches of Paris society, not omitting its undercurrent of intrigue. F. also wrote many successful comedies. In 1862 he was made a member of the Academy in place of Eugène Scribe, and in the following year officer of the Legion of Honour.

Feuille′ton (Fr. 'leaflet'), properly a portion of a political journal reserved for non-political matters, consisting generally of articles of criticism, light literature, art, belles-lettres, &c., usually printed in smaller characters at the bottom of the page, and separated from the matter above by a line. This system of publication was introduced by the *Journal des Débats*, and soon became highly popular. The *roman-F.*, a fiction published in this way, has extended from France to England, Germany, and America. The writer of such articles is a *feuilletoniste*.

Feve′da, an island of British Columbia, in the Strait of Georgia, between Vancouver Island and the mainland. It is 32 miles long by 2 broad, and is valuable principally for its coal.

Fe′ver (Lat. *febris*, from *ferveo*, 'I grow warm,' or from *februo*, 'I cleanse') has been defined as a complex morbid state which accompanies many diseases as part of their phenomena, more or less constantly and regularly, but variously modified by the specific nature of the disease which it accompanies. The recognised characteristics of F. are those which relate either to the disintegration of the living substance of the body, or to the increase and diminished constancy of the bodily temperature. F. is both a state and a process, and has its beginning in the entrance into, or action on, the organism of some affecting or infecting cause. This event is followed by a period of latency, after which the first indications within the affected or infected organism begin to manifest themselves; but the F. process may vary indefinitely in its course, in its duration, and in the local inflammations which accompany it. In all cases, however, F. has its onset, accession, and declension, the onset being characterized by shivering, accompanied with rise of temperature of the internal parts of the body; the accession, by continued pyrexia and exhausting disorder of the bodily functions; the declension, epicrisis, or defervescence, by the restoration of these processes to their normal conditions and relations. Regarding the nature of F. and its relation to the febrile process, there are two possibilities, one being that F. originates in disorder of the nervous centres, and that by means of the influence of the nervous system on the systemic functions, the liberation of heat at the surface of the body is controlled or restrained, so that 'by retention' the temperature rises, and the increased temperature acts on the living substance of the body and disorders its nutrition; the other being that F. originates in the living tissues, and is, from first to last, a disorder of protoplasm, all the systemic disturbances being secondary. The most recent investigations have led to the conclusion 'that no disorder of the systemic functions, or of the nervous centres which preside over them, is capable of inducing a state which can be identified with febrile pyrexia; but that it is possible for such a state to originate and persist in the organism after the influence of the central nervous system has been withdrawn from the tissues by the severance of the spinal cord.' The tissue-origin of F. may, therefore, be adopted as the basis on which to construct an explanation of the F. process. This F. process is the prelude or accompaniment of a great variety of diseases, accidents, and surgical operations, but the term is most commonly applied to specific fevers, such as typhus and typhoid F., scarlet F., intermittent and remittent F., yellow F., and dengue. Small-pox and measles, although not usually called fevers, are so in reality. There being no single disease to which the term is applicable, no mode of treatment can be laid down suitable to every case of F. The treatment of F. will, therefore, be considered under the different forms of the disease referred to.

Fe′ver Bush, a shrub occurring frequently in the U.S. of America, and ranging from 10 to 4 feet in height. It is generally found in shady woods and near the edge of swamps. The foliage is abundant and handsome, and the flowers are of a yellowish-green colour. It bears bunches of dark-red fruit containing berries which, when ripe, are sometimes used as allspice. The young branches yield a juice useful as a cattle-medicine, and as a curative lotion when the skin is suffering from the itching effect of the poison of the sumach.

Fever Bush.

Fe′verfew, a genus of Composite plants, common in our gardens, and deriving its name from having long been employed as a popular remedy in ague and other fevers. It appears to possess stimulant and tonic properties. F. is a perennial plant, and may attain a height of 1 or 2 feet. Its leaves are flat and broad, its flowers small. It is nearly allied to Camomile (q.v.). The variety grown in gardens is generally of double nature. The Mayweed has larger flowers with white ray and yellow disk florets. It is common in cornfields and hedgerows.

Fe′verwort, a genus of plants included in the natural order *Caprifoliaceæ*. They are found in N. America, where, under the name of Tinkar's Root (from Dr. Tinkar), they have been long employed as emetics and purgatives. The berries are also used as a substitute for coffee. The F. has an erect rounded stem, opposite leaves, axillary whorls of flowers, a tubular corolla, and three-seeded berries.

Fez, or properly **Fês** (Arab. 'the fertile'), one of the capitals and provinces of Marocco, is picturesquely situated in the valley of the Sebu, 100 miles inland from its port, Mehedia. It is the Rome of the Western Arabs, and has, it is said, 360 mosques, of which the chief is the *El Karubin*—an inviolable sanctuary even for criminals of the deepest dye, and containing a screened chamber for women who are here, alone of all other Mohammedan places of worship, allowed to attend for prayer. During the 10th c. the Western Arabs performed their pilgrimage to F., while the Eastern Arabs went to Jerusalem, as the passage to Mecca was impossible at that time. There are several public schools, and a university, beside the sultan's palace, and numerous bazaars, caravanserais, baths, &c. The town is surrounded by walls. F. is the centre of an active caravan trade reaching to Mecca in the E., and to Timbuctu in the S., and has manufactures of Beduin mantles, morocco leather, linen, fine tapestry, jewellery, carpets, silks, slippers, and F. caps (called so, as F. was the place at which they were first made). Pop. estimated at 136,000, mostly Moors, Beduins, Berbers, Jews, and Negroes. F. was founded by Edris II. in A.D. 808, and was one of the largest and richest cities of the Mohammedan world in the Middle Ages.—The *province* of F., the most northerly in Marocco, was formerly an independent state. In 1548 both town and province were annexed by the Emperor of Marocco. Area, 117,725 sq. miles; pop. 3,158,000.

Fezzan (anc. *Phazania*), a great oasis of N. Africa, and the most southerly province of Tripoli, stretches from the springs of Meshru to the town of Bondshem, a distance of 350 miles. Area, 25,000 sq. miles; pop. 27,800, mostly Berbers and Beduins. It is traversed in the N.E. by two parallel ranges—the Black and White Mountains; and in the S. the fertility of its wadies gives way to the burning sands of the Sahara. The climate is very unhealthy, the summer temperature frequently reaching 133° F., and falling to 20° in winter. Journeys are performed on the camel or horse, and the plateaux are infested with the wild animals and birds of the great waste. Murzuk, where the sheik lives, is the capital (pop. 4160), and there are many small towns (the principal one is Sockna) and villages. The natives resemble negroes in colour, but are of Berber family, and speak a mixed Berber and Arabic language. Asses, camels, sheep, goats, cows, and horses are reared, and the country produces wheat, dourra, barley, and dates. The principal route from the Sudan passes through F. to the Mediterranean, and not unfrequently slaves form part of the caravan. Cornelius Balbus conquered F. for Rome in the 1st c. A.D., and in the 7th the Arabs overran the country. In 1842 F. fell to the Turks.

Fi′ars (Fr. *feurs*, 'money for tillage,' or Icel. *fe, fiar*, 'money'), in Scotch law, are the prices of grain in the different counties fixed by their respective sheriffs, in February each year, with the assistance of juries. The form of striking the F. is prescribed by Acts of Sederunt of the Court of Session. They regulate the prices of all grain stipulated to be sold at fiar prices. They also regulate the price in contracts concerning grain to be delivered, and in cases in which no price has been agreed to between parties. Results are arrived at by examining witnesses, whose testimony is digested by a skilled accountant.

Fias′co, an Italian word (from Mid. Lat. *flasco*, 'a flask,' but the reason for the derivation is unknown) applied to a failure generally, but originally an expression of frequenters of the theatre in Italy to mark a musical failure. The word has been introduced into France, Germany, and England.

Fi′at (Lat. 'let it be done'), a legal term for an order or warrant for the doing of an act. It was a term till lately of frequent use in the law of England under the Bankruptcy Act. But the term has now been abolished since the substitution of petition for adjudication was made under statute 12 & 13 Vict. c. 106.

Fi′ber. See BEAVER and MUSQUASH.

Fi′bres. By F. in histology is meant a microscopical solid filament. There are various kinds of F. found in the body, namely, white fibrous tissue, elastic tissue, involuntary muscular fibre, voluntary muscular fibre, and nerve fibre. These will be found described under their respective headings.

Fibres, Tex′tile, are all substances, mineral, animal, and vegetable, employed to form cordage or woven into webs. This definition includes all metallic wires from which cordage or wire cloth is formed, although such are not usually regarded as T. F. Besides these metallic substances, asbestos or amianthus is a fibrous material derived from the mineral kingdom, which has occasionally been woven into a kind of cloth, and in recent years has been much used for engine-packing, non-inflammable millboard, and such purposes. The ordinary T. F. of commerce are, however, entirely derived from animal and vegetable sources, and all those of any economic importance will be noticed under their proper headings. We here simply enumerate the principal fibrous materials.

Animal Fibres.—The chief T. F. of animal origin are Silk (q.v.) and the Wool (q.v.) of sheep, closely allied to which is the pashm, or fine wool of the Cashmir goat, and Mohair (q.v.). Camels yield a woolly hair much used for weaving and felting in Russia and Western Asia. To this family belong the Guanaco, Vicuña, and Alpaca (q.v.). The hair of several other animals, including the rabbit, the hare, the nutria, &c., is used for felting purposes. Horsehair must also be included among T. F., being used for the seating of chairs, sofas, &c.; and as a simple curiosity among animal fibres, the byssus of a mollusc (*Pinna squamosa*) deserves mention, as being occasionally woven into small articles.

Vegetable Fibres.—Of all vegetable fibres the most important is Cotton (q.v.), and next to it is Flax (q.v.). Following these comes Jute (q.v.), and for cordage specially, but also for weaving purposes, Hemp (q.v.). Esparto (q.v.) grass is now of extensive use in making paper. China grass, the beautiful fibre yielded by *Bœhmeria nivea*, has not yet won the prominence it deserves, from the difficulties connected with its preparation. Phormium fibre or New Zealand flax, derived from *Phormium tenax*, is highly useful, as is also Coir (q.v.), obtained from the outer husk of the coco-nut, and Manilla hemp, the produce of *Musa textilis*. The following are also of some importance—Sunn hemp from various species of *Crotalaria*, bowstring hemp from species of *Sanseviera*, aloe fibres from species of *Agave*, plantain fibres from species of *Musa*, lime-tree bast from *Tilia Europœa*. The fronds of several palm-trees also yield fibrous materials of considerable value for weaving, plaiting, and basket-making, and wheat straw and the stalks of many other grasses are employed for hat and mat making.

Fi′brin, Fibrin′ogen, Fibrinoplas′tic Sub′stance. In the coagulation of the blood a substance is formed known as F. At one time it was supposed to exist as such in the blood, but now it is known that it is formed by the union of two other matters, namely, fibrinogen and fibrinoplastic substance. See BLOOD, COAGULATION OF.

Fi′bro-Se′rous, a term used in anatomy to denote certain membranes, such as the pericardium, which are double, being composed of a layer of fibrous tissue lined by a layer of endothelial cells constituting a serous coat.

Fibula.

Fibula, a brooch or clasp in use in ancient times and during the Middle Ages, was made of gold, silver, or ivory, and sometimes ornamented with precious stones.

Fich′te, Johann Gottlieb, a German metaphysician, was born at Rammenau, Upper Lusatia, on 19th May, 1762, and studied theology at Jena. During a visit to Switzerland he made the acquaintance of Lavater and of Johanna Rahn, the niece of Klopstock. He then taught Greek and philosophy privately at Leipzig, and in 1792 went to Königsberg to see Kant, to whom he presented his *Kritik aller Offenbarung*. Its publication rescued F. from starvation, and gave him a chair of philosophy at Jena. Here he lectured with such intensity of moral enthusiasm and such original power of speculation that he was accused of atheism and had to resign. In 1799 he retired to Erlangen, where he occupied the chair which he afterwards filled at Berlin. The political tragedies of the time gave immense significance to his words. In 1810 he was employed to reconstruct Berlin University, of which, although there was a crowd of the most distinguished scholars in the chairs, he was made rector. When Germany rose against Bonaparte after his fatal campaign in Russia, F. enrolled himself as a volunteer in 1813, but died 27th January, 1814, from a fever caught while nursing his wife, Johanna Rahn.

As regards F.'s philosophical position, we must recollect there were already many modifications of Kantianism. Reinhold added a representative faculty. Sigismund Beck pointed out that the assumption of a *ding an sich* or *noumenon* was not consistent with the spirit of the critical system. Jacobi had advocated an intellectual intuition as a source of spiritual truth. Bardili had already effected a monistic analysis—thought is the ground of all, for the concept of possibility precedes the apprehension of reality. Schultze and Maimon had arrived at pure scepticism. F.'s heresy from Kant consisted in referring the non-ego, the objective element in knowledge, to the pure activity of the ego. Substance is merely a mental synthesis of accidents. Without the ego, then, there is no non-ego, no object, no world; and unless the ego be regarded as a spontaneous activity (*thathandlung*), you get the contradiction of A and not-A each requiring the other as its condition. Mankind are quite correct in attributing a real existence to objects, but the object is not independent of the subject, they are identical. On any system of dualism you must be content with a knowledge of phenomena; but admit the unity of existence, and your knowledge becomes certain. F. is, however, compelled to assume an underlying force different from the ego (*anstoss*) which originates all the reflective power and self-limitation of the ego. Perhaps this force is what he calls the 'reine Form der Ichheit, welche noch nicht Individuum ist'—an impersonal reason, like the 'divine mind' of Berkeley. Morality, or the perfect freedom and development of the ego, consists in the gradual assimilation of the non-ego which at first appears in opposition to the ego. Thus human virtue creates the world, it is the incarnation of duty. God is the infinite moral order, and is the subject of faith, not inference. In the *Wissenschaftslehre* he states the end of life to be the ordering of human relations with freedom according to reason, human life being assumed to be a necessary part or development of divine life. The five epochs are the state of innocence and instinct; the age of authority, external institutions, dogmatic creeds, and progressive sin; the age of indifference to truth, and the complete rejection of the authority of reason, conscious or unconscious; the age of science, in which the laws of reason are clearly seen, and truth is revered for its own sake; the age of art, in which humanity becomes beautiful by its cultivated and enlightened freedom. In the *Reden*, when Berlin was in the hands of the French, he contends that the *Mischvolk* (or mixed Romance nations, like the French) are now exhausted, while the *Urvolk* (primitive or German nations) have the world's future within them. F. took the deepest interest in the cause of German independence, and his fervid eloquence was constantly employed in stirring up his fellow countrymen in their contest against Napoleon.—**Immanuel Hermann F.**, son of the preceding, was born at Jena, 18th July, 1797. He studied philology at Berlin, and was early devoted to history and philosophy. He spent his early life as a teacher, was made Professor of Philosophy at Bonn in 1836, and at Tübingen from 1842 to 1875. He died in 1876. His works are voluminous. In philosophy F. was mainly a disciple of his father. He was strongly opposed to the Pantheistic doctrines of Hegel, against which he advocated what he called 'concrete theism,' maintaining the personality of God and the perfect dualism between God and the world. He held that the chief fact in the history of German philosophy was the contest between Theism and Pantheism; that the latter had been most ably developed by Hegel, who, however, had been refuted by Baader; that recent progressive German thought was represented by Krause, Weisse, and Lotze. Christianity, he believed, ought to become a great instrument of civil reform. He wrote several political pamphlets advocating moderate Liberalism and decrying revolution.

Fici'no, Marsil'io, one of the leading scholars of the Renaissance, and one of the first who made Plato known to Western Europe, was born at Florence, 19th October, 1433. His father was physician to Cosmo de' Medici, who founded a Platonic school, of which he made F. the teacher. F. translated Plato and several of the Neo-Platonists, and lectured at Florence with shining success. His most distinguished pupils were Politiano and Lorenzo de' Medici, the latter of whom gave him a canonry in Florence cathedral. He died at Careggi, 1st October, 1499. Like his friend Mirandola, he sought to reconcile Platonic philosophy with Christianity, and developed a mystical theism enwoven with mediæval sentiment. Platonism, he held, was a foreshadowing and confirmation of Christianity, and he kept a lamp ever burning before the bust of Plato, as if it had been the image of a saint. He vastly aided the classical revival, while his fervent philosophy did much to counteract the immorality of the Church and the pagan license favoured by many of the humanists. His works, of which the *Theologica Platonica* and the translation of Plato were issued at Venice in 1516, were published at Basel in 1491, 1576, and at Paris in 1641. See Symond's *Renaissance in Italy*.

Fiction. See NOVELS.

Fiction of Law is a legal assumption that that is true which is either untrue or is as probably false as true. The law of England has adopted fictions more largely than that of any other country, but to some extent all nations have done so, dreading, according to Dr. Colquhoun (*Summary of the Roman Civil Law*) 'to adopt any abrupt measure which might disturb the practice and effect of former decisions.' By this he means that it is often considered desirable, in making a substantial change, to keep pace with social progress, to preserve an ancient form, and to force the change and the form into apparent harmony by means of a fiction. Thus while social progress has made it necessary that power which formerly belonged to the Crown in England should be transferred to the House of Commons, the dignity of the Crown—and consequently the social sentiment which has gathered round the institution from historical association—is preserved by important acts being still done in the name of the Sovereign. No doubt the social weight of royalty is preserved by this fiction, and a practical end desired by the people of England is thus attained. But where there is no sentiment in question, it is difficult to see the use of legal fiction.

Fid, a square bar of iron or wood which forms the support of topmasts. It is passed through a hole at the heel of the topmast, and its extremities rest on the tressel-trees. The *splicing-F.* is a pin tapering to a point at one end and made with an eye at the other, used by sailors in opening the strands of ropes preparatory to *splicing*.

Fid'eicommiss'um, a term of Roman law denoting the position of an estate bequeathed to an heir with the condition that he should transfer it to a third person mentioned, that third person being sometimes directed to pass it to a fourth person, and so on. When the practice of so bequeathing property was first introduced into ancient Rome, it was not sanctioned by the laws; performance of the condition therefore depended on the good faith of the heir; but in the reign of Augustus that monarch instructed the prætor to enforce these trust obligations. The condition of F. might be either particular or universal. If the former, it only applied to part of the inheritance; if the latter, it applied to the whole of it. Estates *fideicommissa* are the earliest instance which we find of entails. (See ENTAIL.) The authority given to the prætors by Augustus was by Clodius extended to the consuls and governors of the provinces. In German civil law the *fideicommiss* is the regulation according to which the whole or part of a family property goes to a certain member of the family conditionally on his leaving it to the person indicated by the family arrangement. In Holland also the principle of F. has important application in regulating succession to land.

Fidic′ula, a small lyre-shaped musical instrument.

Field, in heraldry, the ground or whole area of the shield, said by old writers to be so named because the charges upon it originally represented the great deeds done upon the field of battle.

Field, Cyrus West, was born at Stockbridge, Massachusetts, 30th November, 1819, and rose by energy and perseverance to be the head of a large mercantile business. He travelled in South America, and later became deeply interested in ocean telegraphy. In 1854 he took up the idea of an Atlantic cable, founded the two great transatlantic telegraphic companies, and toiled incessantly till he saw the realisation of his hopes in 1866. (See TELEGRAPH, SUBMARINE.) In the course of this work he crossed the Atlantic some fifty times. He received many medals and honours, and was afterwards engaged in helping to establish telegraphic communication between Europe, India, China, Australia, and S. America. Died 12th July, 1892.

Field Allow′ance, a compensation allowed to British officers for service in the field, in consideration of the extra expense which such service entails. When in camp in the United Kingdom or in the colonies, *ordinary* F. A. is made; when engaged in active service, *i.e.*, during a campaign, *extra* F. A. is made. *Ordinary* F. A. for a general is £1 10s. a day, *extra* £2 10s.; for a 2nd lieutenant, 1s. and 1s. 6d. respectively.

Field Bug, a genus of Hemipterous insects belonging to the Heteropterous section of the order. These insects occur in fields and amongst grass, and possess mouths adapted for biting and suction.

Fieldfare, a species of British thrushes included in the Dentirostral section of the order *Insessores* (q.v.). The F. arrives in Britain in winter, and departs in May or June for N. Europe to breed and build. The upper parts of the birds are ashen grey; the head is marked with dark-brown spots. The back, wings, and tail are dark brown; the chin and throat of a golden hue, spotted with black; the breast is reddish brown, and the belly white. The average length of the F. is 10 inches. Its nest is made of sticks, grasses, and clay. The eggs number three, four, or five, and are of light brown colour, spotted with dark brown.

Fieldfare.

Field-Glass is the lens interposed between the object-glass and eye-glass of a compound Microscope (q.v.), to receive the rays diverging from the focus of the former, and thus to render the image magnified by the eye-glass of more convenient dimensions and of greater distinctness than would otherwise be the case.

Field′ing, Copley Vandyke, the most distinguished member of an English family of painters, was born in 1787. A painter in water-colours and a teacher of art, he spent a singularly peaceful and prosperous life, was elected President of the Old Society of Painters in Water-colours, and held the office till his death, at Worthing in Sussex, 3rd March, 1855. He is one of the greatest of English landscape painters, though his manual dexterity and reputation led him latterly to produce many conventional pictures. The ideas which in these had become stereotyped he had originally taken from nature. His happiest efforts are vapoury perspectives in the Weald of Sussex, stormy sea-pieces off the chalky Kentish coast, and leafy dens in Hampshire.

Fielding, Henry, a famous English novelist, was born at Sharpham Park, near Glastonbury, Somersetshire, 22nd April, 1707. His father was Lieutenant-General Edmund F., a cadet of the Denbigh family, and thus connected with the imperial house of Hapsburg. After an education at Eton, where Fox and Lyttelton were among his friends, F. in his eighteenth year was removed to Leyden University. There he remained for two years, studying civil law, until his father's poverty compelled him to leave Germany for London. In his own words, he had to turn 'either hackney writer or hackney coachman,' and so, choosing the former alternative, he began to write comedies and farces. His first play, *Love in Several Masques*, was acted at Drury in 1728. From that time onwards he produced a constant succession of dramatic pieces, composing no fewer than six in the one year 1733. In 1736 F. married Miss Craddock of Salisbury, and about the same time fell heir to an estate in Dorsetshire of £200 a year. His improvidence, however, soon wasted this small fortune, and in 1739 he had to take refuge again in London. He resumed his legal studies with great diligence, and was called to the bar in 1740, but being prevented from practising by repeated attacks of gout, he had to fall back once more on the theatre and literature, and became editor of a paper called *The Champion*. In 1742 appeared his first novel, *Joseph Andrews*, originally intended as a parody on Richardson's *Pamela*. About this time his wife, to whom he was tenderly attached, died, and shortly afterwards F. braved the conventional by marrying her maid. His next published works were the *Journey from this World to the Next*, and *Jonathan Wild* (1743); but in 1748 the interest of Lord Lyttelton made F. independent of authorship, by procuring for him the police-magistracy of Middlesex and Westminster, which office he filled with much conscientiousness and credit. In the same year *Tom Jones* was published, and two years later *Amelia*. For the former of these works F. received £600, and for the latter £1000. The great novelist's health was by this time entirely ruined, and in July, 1754, he resolved, as a last resource under his complication of diseases, to seek the warmer climate of Portugal. This, however, was of little avail; he died at Lisbon, 8th October, 1754. F. is in some respects the greatest of English novelists. His inspiration was received from Richardson, but he is, far more than Richardson, the creator of the English novel. His power lies greatly in his intense yet artistic realism; and this charm is enduring, for he was not more conversant with the manners and feelings of his own time than with those feelings of humanity which are the same at all times. Hence it is that Byron calls him 'the prose Homer of human nature.' He had seen both high and low life, and reproduced both, but especially the latter, with consummate art. Many of his best-known personages are drawn from living models. The immortal 'Parson Adams' had for prototype the Rev. William Young; 'Mr. and Mrs. Booth' were Fielding and his wife—the latter appears also as 'Sophia Western'; 'Parson Trulliber' was F.'s tutor; and 'Squire Allworthy,' 'Blifil,' and 'Lord Fellamar,' all had representatives in real life. F.'s skill in the construction of a plot is not great, and one can only regard Coleridge's dictum that the '*Œdipus Tyrannus*, the *Alchemist*, and *Tom Jones* are the three most perfect plots ever planned,' as a profound hallucination. Yet F.'s fertility of invention was not lawless or digressive. There is a certain unity of design in all his work, and he excites interest without violating probability. Some of the finest features of his genius reappear in Thackeray. The masterpiece of F. is *Tom Jones*, a work of fiction unsurpassed for wealth of character, artistic construction, and easy grace of style. Despite occasional coarseness, its morality is on the whole healthy. Gibbon has called *Tom Jones* 'the first of ancient or modern romances,' and La Harpe 'le premier roman du monde.' *Amelia* has been styled the Odyssey to F.'s Iliad; it is less varied and interesting than *Tom Jones*, but the heroine is exquisitely drawn. *Joseph Andrews*, begun as a caricature in the style of Cervantes, ended by becoming a serious fiction, and contains the inimitable character of 'Parson Adams.' *Jonathan Wild*, the least of his novels, is wonderful as a piece of sustained irony. F.'s collected works were published at London in 4 vols. 1762, again in 10 vols. 1764, in 14 vols. 1808, and again in 1821 and 1851. See Murphy's Life, Sir W. Scott's Life, Lawrence's Life, Lady M. Wortley Montagu's *Letters*, Thackeray's *English Humourists*, and Jesse's *Celebrated Etonians*, vol. i.

Field-Marshal, the highest military rank in Britain and some other countries. The title is the same as the *maréchal de camp* of the old French army, and the *feld-marschall* of the German service. The F.-M. is saluted with the standards of all the forces except the Household Troops, who would pay him that honour only in the case of his being their colonel. In peace his pay is the same as that of any other general, but in war he receives nearly double the pay of his generals. There are at the present time seven Field-Marshals: the Prince of Wales, the Duke of Cambridge (late officer commanding-in-chief), Sir J. F. A. Simmons, Sir F. P. Haines, Sir D. M. Stewart, Viscount Wolseley (Commander-in-Chief), and Lord Roberts.

Field-Mouse, Wood-Mouse, or **Long-Tailed Field-Mouse,** the subject of at least one charming poem, is regarded as a nuisance and a pest whereever it occurs. Somewhat larger than a common mouse in tail, ears, and muzzle, it differs from it also in being lighter in the colour of the under parts of its body. It occurs throughout all the temperate regions of Europe, and the ravages it commits in the field and gardens may be estimated from the immense stores of grain and other food found in its storehouse among thick grass or in a hollow of the earth. Another species of F.-M. is the small harvest-mouse. See MOUSE.

Field-Officers are colonels, lieutenant-colonels, and majors, or such as may command battalions, and thus have charge of the field. They are always mounted in order to give ground for movements, circulate orders, &c.

Field of View is the space within which objects can be seen by a telescope or microscope which has been adjusted to its focus.

Field-Train was that department of artillery intrusted with the charge and supply of stores and ammunition, and whose duty it was during an engagement to see that each gun was served with its full supply of ammunition, &c. The duties are now performed by the Ordnance Store Department.

Field-Works are temporary fortifications, as trenches, ramparts, &c., constructed to cover an attacking, or protect an encamped force. See FORTIFICATION.

Fi'eri Fa'cias, in English law, a writ addressed to the sheriff for enforcing judgment against the goods of a debtor. If in execution the officer take the goods of a stranger, he is liable in damage. The writ cannot be enforced after a *Capias ad Satisfaciendum* (q.v.) has been issued. F. F. *de bonis ecclesiasticis* is a judicial writ directed to the bishop of a diocese or to the archbishop of the province when there is no bishop, requiring him to attach the ecclesiastical goods and chattels of a clergyman within his diocese in satisfaction of judgment. This writ is issued when the sheriff has made a return of *nulla bona* to the writ of F. F.

Fies'chi (sing. *Fiesco*), an ancient Italian family, Counts of Lavagna near Genoa, who are discernible in history as early as the 10th c. In the 12th c. we find them always quarrelling with the consuls and community of Genoa, of which, however, they finally became noble burgesses in 1198. The F. had possessions in Piedmont, Lombardy, Naples, Liguria, Umbria, and were owners of Massa and Cassara. The family produced two popes, Innocent IV. and Adrian V., thirty cardinals, more than 300 patriarchs, archbishops, and bishops, not to speak of soldiers and sailors. They were among the most zealous members of the Guelph faction. Few of them, however, possess much historical interest. We may note **Bartolomeo F.,** who flourished in the beginning of the 16th c. By an act of rudeness to a peasant he excited (1505) a revolution of the burgher and artisan classes, who then desired a share with the nobles in the government of the republic of Genoa. The result was that French troops, sent by Louis XII., took possession of the town.—**Giovanni Luigi F.,** born in 1523, distinguished himself by a conspiracy against the ruling house of Doria, which was assisted by Duke Farnese, and approved of by François I. The plot miscarried through the accidental drowning of its chief as he passed on board one of the admiral's ships, 2nd January, 1547. Schiller has dramatized this subject.

Fieschi, Joseph Marco, born in Corsica, 3rd December, 1790, served in Murat's army, and afterwards led an obscure life in France till 1835, when, having lost his place by the Government suppressing it, he resolved, along with Pepin and Morey, to attempt the murder of Louis Philippe on the anniversary of the Revolution (28th July). They contrived the 'infernal machine' of twenty small cannons, which was fired from a house in the Temple Boulevard, killing eighteen persons and hurting F. The king escaped with a slight injury. The conspirators were guillotined, 16th February, 1836.

Fie'sole, a small Italian town in the province of Firenze, crowning a hill above the Arno, about 3 miles from Florence. It is the seat of an archbishop, and possesses an old cathedral. The Franciscan church rises far above the rest of the town, and marks the site of the ancient *arx* or citadel. Many of the wealthy Florentines possess country villas here. Lorenzo the Magnificent and Walter S. Landor lived in the neighbourhood, and at the adjacent monastery the illustrious painter Fra Angelico long served as a brother of the order. F., the ancient *Fæsulæ*, has been an important military station from very early times. It was one of the oldest Etruscan towns, but was never a large place, and has sunk with the rise of Florence. There are parts of a Roman theatre, and remains of cyclopean walls, built with huge quadrangular stones, at F.; and various ancient relics have been found. See Freeman's *Historical and Architectural Sketches*. Pop. 14,273.

Fiesole, Giovanni da. See FRA ANGELICO.

Fife, a kind of octave or piccolo flute, used in military 'drum and F.' bands. Its tone is shrill and piercing—inspiring, but hardly pleasant. It has not keys like the piccolo used in the orchestra, and its musical capacities are thus extremely limited.

Fife-Ness, the eastmost point of land in Fifeshire, 2 miles E. by N. of Crail. From F.-N. a dangerous ridge of rocks, known as the Carr Rocks, projects a considerable way into the sea. On this a beacon, 35 feet high, has been erected.

Fifeshire, an almost peninsular county in the E. of Scotland, bounded N. by the Firth of Tay, E. by the North Sea, S. by the Firth of Forth. Its greatest length is 44 miles, and its greatest breadth 18 miles. The coast is rocky in the N. and N.E., and along the Forth is steep, often luxuriantly wooded, and studded with many thriving towns. In the N. there are low offshoots from the Ochils, separated by the strath of the Eden, or Howe ('hollow') of F., from the central range of the Lomonds, which rise in W. Lomond to 1713 feet. Largo Law, in the S., is 1020 feet high. The chief rivers are the Eden and Leven. The climate is somewhat bleak and damp in the N., but dry and mild in the S. F. is well cultivated, the richest district being a belt of loam from 1 mile to 3 miles broad, which fringes the Firth of Forth. The county is well wooded, much grain is produced, but the N.W. is mostly heathy upland and barren moor. Of the 323,802 acres, constituting the area of F., 76,854 are under corn crops (oats 42,024), 42,080 under green crops (potatoes 14,527), 63,137 under clover, sainfoin, and grasses in rotation, and 73,711 under permanent pasture or grass not broken up. Small fruit is grown over 145 acres, and 828 represent the amount of bare fallow or uncropped arable land. Mountain and heath-land, used for grazing, account for 6,582 acres, while 34 are laid out as nursery grounds, and woods and plantations cover 21,004. See also articles CATTLE, HORSE, PIG, and SHEEP. The formation is chiefly carboniferous, interspersed with trap. Limestone and freestone are much quarried, and there are valuable coal and iron mines. The principal manufacture is linen, and the most important exports are coal, lime, and fish (salmon, haddock, cod, turbot, &c.). There are also manufactures of plaids and blankets, besides salt works, tanneries, soap factories, and tile yards. The iron manufacture is much on the increase. The chief places are Cupar, the county town, St. Andrews, Kirkcaldy, Kinghorn, Dunfermline, E. and W. Anstruther, Burntisland, Crail, and Dysart. F. was anciently the most flourishing region in Scotland. Its thanes seem to have been the most powerful of Scottish nobles before the 11th c. It was styled the 'Kingdom of F.,' but does not figure greatly in Scottish history until the Reformation struggles. Objects of interest in the county are the Castle of Falkland, the crosses of Macduff and Mugdrum, Beaton's Tower, and the abbeys of Balmerino and Inchcolm. There are two parl. divs. of F., each returning one member: E. F., pop. 50,996; and W. F., pop. 58,458. Pop. of F. civ. county 187,346.

Fifteenth′, in music, an interval of two octaves.

Fifth Monarchy Men, a small fanatical sect which arose in England about 1654. They were sometimes called Millenarians, and believed that a fifth monarchy was to succeed the four monarchies of Daniel's vision—the monarchy of Christ on earth, which was to 'stand for ever,' or to remain for 1000 years. They anticipated the immediate advent of the Messiah on earth, and declared that whatever was opposed to the establishment of Christ's kingdom must be assailed by true believers. These tenets led to their conspiring to murder Cromwell in 1657, but their plot was disclosed and their leaders were flung into prison. Shortly after the Restoration they rebelled in London under one Venner, but were promptly suppressed, and Venner and others were executed. Others of the sect were executed in 1662 on a charge of having conspired to murder Charles II. The people seem to have confounded them with the early Münster Anabaptists, and their excesses drew odium on the Baptists, Quakers, and Independents, who had no connection with their risings.

Fig, a genus of Exogenous plants, belonging to the *Urticaceæ* or nettle order, but also included by some botanists in the *Artocarpaceæ*, or bread-fruit and mulberry order, and in a special section (*Moreæ*) of the latter group. The *Moreæ* have flowers in heads, spikes, or catkins; the embryo being hooked, and the albumen fleshy. In the F. the fruit is named *polygynæcial* or *anthocarpous*, and consists of a hollow 'receptacle' of fleshy nature, within which numerous male and female flowers are contained. The *receptacle* is the extremity of the peduncle or flower-stalk, which becomes hollow and modified to contain the flowers. The seeds are single-seeded carpels, embedded in the pulp of the fruit. The figs form numerous species, of which the most familiar is the common F. This plant is a native of the East, but is cultivated with success in S. Europe, and in Britain in hothouses, although sometimes figs may ripen in this country as outside-growing plants. The F. is the *teenah* of Scripture, and is the first tree mentioned by name in the Bible. The figs imported into Britain come chiefly from Turkey. They are sent in 'drums,' or small boxes, from Smyrna. Figs are eaten simply as fruits, but are also used as mild purgatives or laxatives, and in the form of cataplasms are applied to painful boils, &c. The pulp contains about 60 per cent. of saccharine substance named *sugar of F.* The common F. appears as a low shrub or tree, the leaves being palmate and deeply cleft. In the East two crops annually are yielded. Another F. yields India-rubber, and is frequently cultivated as a house-plant, on account of its green leaves and handsome appearance. The Banyan (q.v.) tree is a species of the Indian F., while another species, the Peepul-tree, is an object of veneration to the Hindus. Many other species are familiar to botanists, the juice of certain forms being acrid and poisonous.

Fig.

Fig′aro, a celebrated character introduced by Beaumarchais about the end of last century into three of his comedies —*Barbier de Seville*, *Mariage de Figaro*, and *Mère Coupable* —and adopted from them by such operatic composers as Mozart and Rossini. F. is a barber, who by his dexterity, and what is better expressed in French than in English, as an *esprit net et decidé*, succeeds in outwitting every one with whom he comes in contact. F. is also used to designate a collection of the writings of Spanish humourists, and as the name of satirical journals published in France and in England. The first French newspaper of the name was started on the restoration of the Bourbons, the second in 1854 by Villemessant.

Fi′geac, a town of France, in the department of Lot, 32 miles N.E. of Cahors, situated in a deep picturesque valley, amid rich woods and vineyards, and of a very antique aspect. Its chief buildings are the church of St. Sauveur, which dates from the 11th c., and the Château de la Baleine, an old feudal fortress now used as a courthouse. F. arose from a monastery founded here by Pippin the Short in 755. It has some trade in wine, manufacture of linen, and dyeworks. Pop. town 6680; arrond. 81,682.

Fight, Challenge to, by word or letter, is a misdemeanour, punishable with fine or imprisonment. Any direct endeavour to provoke a challenge is a misdemeanour, though mere words which may tend to that—such as calling a man a liar or rascal—are not necessarily criminal. See DUEL.

Fighting Fish, a small fish belonging to the family (*Anabasidæ*) of the Climbing Perches (q.v.), and found in rivers and lakes in Siam and other parts of S.E. Asia. It is exceedingly pugnacious, and when several of them are brought together in a confined space, they afford sport to the spectators by their combats, the exhibitions of which are said to be licensed by the state. Their hind and dorsal fins are elongated, and their colours, when they are excited, are very brilliant.

Fig-Shell, a mollusc, of the *Gasteropoda* order. Thirty-nine species exist. The shell is shaped like a pear, the spire short, and the outer lip thin. Very small tentacles are attached to the head of the animal. The foot is simple in front. The F.-S. occurs in most tropical waters, and on the shores of Panama is found in large quantity and of unusual size; upon this species the natives feed.

Figue'ras (Span. 'fig-trees'), a town in the province of Gerona, Spain, 60 miles N.E. of Barcelona. It stands in a fertile plain near the confluence of the Muga and Manol, and is defended by the fortress of S. Fernando (built about the middle of the 18th c.), which was captured by the French in 1808, 1811, and 1823, and again restored to the Spanish. F. has manufactures of paper and leather. Pop. 2931.

Fig'urantes, the name applied to the general body of dancers in a ballet—those that dance *en masse*, or are posted in the background—as distinct from the principal dancers.

Fig'urate Numbers are the numbers of a series formed from an arithmetical progression according to a certain definite rule. The *n*th number of the first series is equal to the *sum* of the first *n* numbers of the progression; and each term of the second series is formed in the same manner from the first series of F. N. and so on. *Polygonal* numbers are particular cases of F. N. Thus the series bearing the name of an *n*-sided figure in the first series of F. N. formed from the arithmetical progression whose first term is unity and whose common difference is $(n-2)$. The following are the first three series of polygonal numbers:—

Triangular	1	3	6	10	15	21	&c.
Quadrangular	1	4	9	16	25	36	&c.
Pentagonal	1	5	12	22	35	51	&c.

Pyramidal numbers are the F. N. formed from the polygonal numbers. These appellations, introduced as expressive of the properties of each class, very rarely appear in modern works. The operation is evidently the inverse of the fundamental operation in the calculus of finite differences, and is in itself of little practical importance.

Fig'ure, in geometry, is a finite space bounded by lines or surfaces. In arithmetic, it is a name commonly given to the Arabian numerals.

Figure Stone. See SOAP-STONE.

Fig'worts, the name given to a large natural order of Exogenous plants, represented by the calceolaria, veronica, foxglove, Eyebright (q.v.), Euphrasia (q.v.), and other genera. The plants of this order are herbs or small shrubs, with opposite, alternate, or whorled leaves. The calyx consists of four or five parts, and the corolla is irregular. Two or four stamens exist, five being rarely developed. The ovary is bilocular and the fruit a capsule, or more rarely a berry. The seeds are albuminous. Many of the F. are showy plants; they are found in both cold and tropical regions.

Fiji', Feejee', or **Viti Islands,** an archipelago in the S. Pacific, lying between 15° 40' and 20° S. lat., and 177° E. long. and 178° W. long. The number of islands composing it is about 518, of which only 80 are inhabited, many being mere pinnacles of rock rising out of the sea. The total area of the group, including Rotumah, where a European Commissioner resides, is about 8045 sq. miles, more than two-thirds of which are occupied by the two large islands of Viti Levu (4112 sq. miles) and Vanua Levu (2432 sq. miles). The areas of the islands of Taviuni and Kadavu, the next largest, are 217 and 124 sq. miles respectively. The archipelago was discovered by Tasman in 1643, and in 1776 was sighted by Captain Cook, though he did not touch there. In 1796 several missionaries proceeded to F., with the intention of starting a mission, but the threatening attitude of the natives caused them to abandon the enterprise without landing. In 1804 some convicts who had escaped from New South Wales in an open boat reached F., and became the advance guard of a chance white population of shipwrecked and runaway sailors. A Wesleyan mission was established in 1835, and in the same year commercial relations with New South Wales were set on foot. It was not until 1866, however, when an influx of European settlers from New Zealand began, that the trade of F. emerged from obscure insignificance. From that date settlers and capital poured into the group from the Australasian colonies, and at length, after repeated applications to that effect, both from the native king, Cakobau or Thakombau, and the European inhabitants, the islands were annexed to Britain as a Crown Colony. The annexation took place on 10th October, 1874, but it was not until 1st September, 1875, that the colony was formally proclaimed by its first governor, Sir Arthur Gordon.

F. is a Crown Colony, and the government is carried on by a Governor, appointed by the Crown and assisted by Executive and Legislative councils. The Governor is also High Commissioner and Consul-General for the Western Pacific. Twelve native chiefs and 160 subordinate native officers assist in the administration of the 16 provinces into which the islands are divided.

The F. Islands are of volcanic origin, and consist almost entirely of steep mountains sloping abruptly to the sea, and girt by coral reefs. The climate being humid and the soil fertile, the vegetation is luxuriant. Coco-nut oil, yams, tortoise-shell, and *bêche de mer* were the staple articles of native commerce; but since European settlement fairly commenced, cotton, tea, pea-nuts, bananas, sugar, tobacco, coffee, and maize have been successfully cultivated. Horses, mules, sheep, cattle, and Angora goats are reared here. The rainfall is about 96 inches annually, and the temperature varies from 62° to 94° Fahr. The chief obstacle in the way has been the scarcity of suitable labour, for the natives being indolent and inefficient, it has been found necessary to import labourers from neighbouring groups of islands. This traffic is now strictly regulated under Acts of the imperial legislature, and a number of armed cruisers are employed to see that the law is obeyed.

The aborigines of F. belong to the Melanesian race, and their colour varies from nearly black to a dark olive, which is the prevailing shade. They are a weak and cowardly race, and formerly indulged in cannibalism, which the missionaries succeeded in abolishing in 1854. In 1875 the islands were decimated by an epidemic of measles, introduced by H.M.S. *Dido*, by which it is estimated 50,000 persons were carried off.

There are two state-aided public schools—at Suva and Levuka—and the attendance at these is about 140; but the Wesleyans and Roman Catholics maintain over 2000 schools, of which 148 belong to the latter community. The government also supplies an industrial and technical school, where over 70 native youths are taught cattle-tending, house-building, boot-making, &c. No military force is employed in the colony, but the native police, numbering 100, are armed with rifles. The heathen natives, who are now confined to the more inaccessible mountain districts, are known by the name of 'devils.' They still give trouble occasionally to the government.

The capital of F. is Suva, situated on the S. coast of the island of Viti Levu. The exports of F. for 1893 were estimated at £355,632, and the imports at £276,398. Sugar was the principal export, and valued at £246,251; the others being copra, bananas, pea-nuts, desiccated coco-nut, cotton, maize, and distilled spirit. There are 11 sugar mills, and 2 tea factories in the islands. In 1881 the pop. numbered 127,486; since then a decrease has taken place, and there are now 121,180 inhabitants, of whom 2036 are Europeans, 1076 are Half-castes, 7468 are Indians, 2267 are Polynesians, 105,800 are Fijians, and 2219 are Rotumans. About 50 per cent. are Wesleyans; about 8000 are Roman Catholics, 2000 are of the Church of England, and 30 are Jews. The port of Savu is the calling place of the mail steamers running between Vancouver and Sydney. The group is advantageously situated for becoming the entrepot of a large portion of Melanesia and Polynesia; and now that a stable government exists, the islands may be expected to advance rapidly in prosperity.

File (Old Eng. *feol*, Ger. *feile*, allied to the Lat. *polio*, 'I polish'), a bar of cast steel, having one or more of its surfaces notched into teeth, which is used as a tool for making an approximately smooth surface upon metals or other hard substances. English-made files are known as Lancashire and Sheffield files, the two principal seats of their manufacture being Warrington and Sheffield. They are all made by hand, the attempts to manufacture them by machinery not having succeeded hitherto in this country. The process is as follows:—The *blank* is placed upon an anvil in front of the workman, and held in place by a foot-strap. The cutter then makes a series of nicks with a chisel in the surface of the blank, their direction making an angle of about 55° with the axis of the F. He is guided in fixing the position of each nick by bringing the chisel into contact with the burr thrown up at the last stroke; but the exact distance apart and depth of the cuts he regulates entirely by the inclination which he gives to the chisel and the weight of the hammer and the force of the blow. So wonderful is the skill of some of the F.-cutters, that Holtzapffel, a great authority on all matters connected with tools, says he has known files with *nearly three hundred* cuts per inch. When the F. has been cut upon both sides in the way described, it may be at once straightened and hardened, and will be then ready for use. A F. thus made is called 'float-cut,' or 'single-cut.' In the majority of cases, however, another series of cuts is made on each side, crossing the first, and the ordinary 'double-cut' F. is produced. In files intended for use with softer materials, such as hard wood or bone, a pointed punch is used instead of the chisel, files made in this way being called 'rasps.' Each of the three classes of files—double-cut, single-cut, and rasp-cut—is made in about half-a-dozen degrees of fineness, the coarsest being called *rough*, the medium kinds *bastard* and *second-cut*, and the finest *dead-smooth* or *superfine*. All these varieties are made of many different lengths and cross sections, for different kinds of work. Unless otherwise mentioned, a F. is understood to have two flat parallel faces; a 'half-round' has one surface slightly convex, a 'three-square' F. is triangular in section. Square and round files, and other kinds, are also occasionally used.

File-Fish, the name given to various Teleostean fishes belonging to the order *Plectognathi*, and to the genus *Balistes*, *Diodon*, &c. Their bodies are covered with numerous spines, the presence of which has suggested their popular name. They are also known as 'trigger-fishes,' 'urchin-fishes,' and 'globe-fishes,' the latter name being given on account of their power of distending their bodies at will with air.

Filia'tion, in Scotch law, means the determination of a child's paternity. The presumption of law is that he is the father whom the marriage indicates (*Pater est quem nuptiæ demonstrant*), but this presumption may be overcome by showing that it cannot be fact. Actions of F. are usually brought in the Sheriff Court, but they may be brought in the Court of Session.

Filica'ja, Vincen'zo da, an Italian poet, born of a noble family at Florence, 30th December, 1642. He was educated at the University of Pisa, and soon became distinguished as a jurist in his native town, where, in 1673, he was made a senator, and married a lady of the great house of Capponi. Six *canzoni* on Sobieski's raising the siege of Vienna by the Turks in 1683 made him known through Europe, and won him the congratulations of many sovereigns. A poem in praise of Christina of Sweden brought him liberal gifts from that queen, and in 1702 he was made one of the chief magistrates of Florence. He died 24th September, 1707. F.'s odes, which are full of deep feeling, have now fallen into neglect, but his sonnets, partly devotional, partly breathing a sad scornful patriotism, and cast in vigorous and choice language, are still popular; the two finest, *La Providenza* and *L'Italia*, being known throughout the Continent. *L'Italia* is translated in Byron's *Childe Harold*, canto iv. His private character seems to have been almost without blemish. His works were published shortly after his death; the best edition is that of Venice (1762).

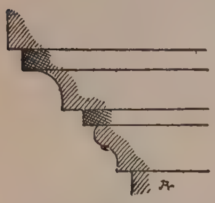
Fil'igree (Fr. *filigrane*), fine gold and silver wire twisted into elegant forms, chiefly for use as personal ornaments. F. work was practised by the Etruscans, and their gold ornaments, combining fine wire (Lat. *filum*, 'a thread') with very minute beading (*granum*, 'a grain or bead'), cannot be equalled by modern goldsmiths. In Eastern countries great minuteness and delicacy are attained in F.-work with the rudest appliances. The Chinese are extremely adroit in silver F.; so also are the natives of the Malabar coast and elsewhere in India. Durable silver F. is largely manufactured in the S. of Europe.

Filio'que is a word which was subsequently added to the Nicene Creed, and formed a bone of contention between the Latin and Greek Churches. The Nicene Council (325), being chiefly concerned to establish the deity of the Son in opposition to the Arians, merely affirmed the existence of the Holy Spirit, without defining the nature and relations of the third person of the Trinity. Macedonius, Bishop of Constantinople (342), and many others, maintained the Holy Spirit to be a created being, as the Son was regarded by the Arians, and subordinate to the Son, as the Son was to the Father. By the Council of Constantinople (381) the simple phrase of the Nicene Creed, *and in the Holy Ghost*, was expanded into *and in the Holy Ghost, the Lord and giver of life, who proceedeth from the Father, who with the Father and the Son together is worshipped and glorified, who spake by the prophets*. But as this only affirmed that the Spirit proceeded from the Father, room was left for doubt whether the Council denied the procession from the Son. If it were meant that the Spirit did not proceed from the Son as well as the Father, this favoured the notion that the Son was subordinate to the Father; if the Spirit proceeded from both the Father and the Son, this seemed to be placing the Spirit in still greater dependence, namely on two persons instead of one. Accordingly the Greek fathers merely taught the procession of the Spirit from the Father, without denying the procession from the Son. The Latin fathers, on the contrary, taught the procession of the Spirit from both the Father and the Son, and at the third Council of Toledo (589)—or, according to Bingham, at Bracara (411)—inserted in the Creed of Constantinople the phrase *F.*, making it run:—'and (I believe) in the Holy Ghost . . . who proceedeth from the Father *and the Son*,' &c. The Churches of the East refused to accept this as an addition to the faith of the Church, or to alter a single word of the Nicene Creed. This led to a schism between the two Churches, which was never thoroughly healed up, although a formal union was effected at Florence, 1439. See Blunt's *Dict. of Doctr. and Hist. Theology; Pearson on the Creed;* Neale's *Hist. of the Holy Eastern Church*.

Filipo d'Argi'ro, San, a town of Sicily, in the province of Catania, 27 miles W.N.W. of the town of Catania. It has a ruined Saracenic castle, and its church of St. Philip, whence it derived its name, was a great resort of pilgrims in the Middle Ages. F. occupies the site of the ancient *Agyrium*, one of the oldest and wealthiest cities of Sicily. Pop. 6078.

Fill'an, St., more properly **Faolan.** There were two ecclesiastics of this name who flourished in the 7th and 8th centuries, and whose memories are still preserved both in Scotland and Ireland. The *first* is called Faolan, the leper of Rath-erann in Alba, and Cill-Fhaelain in Laighis, Leinster, Ireland. His day in the Irish calendar is 20th June. Rath-erann is now known as Dundurn, in the parish of Comrie, Perthshire, and is near the E. end of Loch Erne (in Gaelic Loch Erinn), where there is also the village of St. Fillan's. There is a hill known as Dun-Fhao-lain, at the foot of which is a well dedicated to the saint, and which in 1794, when the old *Statistical Account of Scotland* was published, was visited by scores of people who had faith in the healing virtues of its waters. The *second* Faolan is known as of Strath-Fillan, likewise in Perthshire, but quite on the edge of the old Drumalba, which separated Dalriada from the Pictish kingdom, or Argyllshire from Perthshire. His maternal grandfather is said to have been king of Leinster; his mother, St. Kentigerna of Inchcailleach, in Loch Lomond. In the Irish calendar he is styled of the church of Cluain Maoscna in

Westmeath. Kilallan in Renfrew, written in old records Kilheylan, is named after him, and ought to be written *Cill Fhaolain*. In Strath-Fillan there are still some remains of a religious building consecrated to him. Some call it a priory, others a church. There is great sacredness attributed to this building, as well as to the river which flows beside it; and until a very late period frightful barbarity was practised in imparting their curative virtues to unhappy patients who needed them. Lunatics were brought by their friends and plunged in the river just at sunset, then bound hand and foot, and left all night in the ruins beside what is called erroneously St. Fillan's tomb. If in the morning they were found bound as they had been left, the case was given up as hopeless; but if the knots were untied, it was regarded as the merciful work of the saint, and the sufferers were for ever free of their malady. One very interesting relic of this second F. is still preserved, the silver head which belonged to his crosier, and known as the 'quigrich' (*coigreach*, 'stranger,' 'pilgrim'). In 1487 the right of keeping it was confirmed to Malise Doire or Dewar as its hereditary guardian. It remained in this family till 1877, when it was purchased from Alexander Dewar of Canada for the Antiquarian Museum, Edinburgh. (Dewar, originally *Deòraidh*, signifies first 'pilgrim.' It afterwards came to be applied to the bearer of the baculus or staff of a preacher; latterly it passed into a family name.) It is said by Hector Boece that Scotland owes much to another relic of St. F. At the battle of Bannockburn Bruce found himself and his companions greatly comforted and strengthened by St. F.'s crosier being carried in a silver shrine before them. After the victory he ordered the priory of the saint to be rebuilt.



Fillet.

Fill'et (Fr. *filet*, Lat. *filum*, 'thread'), a small flat face or band used both in Classic and Gothic architecture to separate convex or concave mouldings.

Fillet, in heraldry, a diminutive of the Chief (q.v.), and containing one-fourth of it. The chief, unlike other honourable ordinaries, has only one diminutive (Boutell and Aveling).

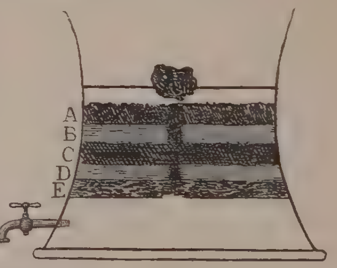
Fillibust'ers. See BUCANEERS.

Fill'more, Millard, D.C.L., the thirteenth President of the United States, was born at Summer Hill, New York, 7th January, 1800. He was apprenticed to a wool-carder, but afterwards studied law, and was admitted to the bar in 1823. He was elected to the New York Assembly in 1829, and was in Congress 1833-35, and 1837-41, where he supported J. Q. Adams on the slavery question. He was made in 1847 comptroller of New York state, in 1848 Vice-President, and in 1850 President of the United States. During his presidency a favourable commercial treaty was signed between the United States and Japan, and a treaty of non-interference in Cuban affairs was made between the United States, France, and Great Britain. After his retirement from the presidency in 1853 he made an extensive tour through the western and southern states and then sailed to Europe. He retired from public life in 1856, and died 8th March, 1874.

Filtra'tion is a mechanical process for removing substances suspended, or sometimes even dissolved, in water and other fluids. As the fluid passes through the fine pores of the filtering medium while suspended, matter is retained either on its surface or in the excessively fine meshes it presents. F. is of the greatest industrial importance in many chemical manufactures, as, for example, in the refining of Sugar (q.v.). In the chemical laboratory, also, it is continually resorted to in order to separate precipitates which would only deposit slowly by mechanical subsidence. In laboratory practice, a cone of unsized paper is usually placed within a funnel, and the fluid to be filtered is allowed to percolate slowly through it.

On a great scale F. is generally required for the domestic water supply of any community. The water is first collected into reservoirs, where all heavy impurities subside, and from these it passes by gravitation through filtering beds, which are variously formed according to circumstances. Usually they consist of a substratum of gravel from 2 to 3 feet thick, covered with fine sharp sand to a depth of from 18 inches to 2 feet. A filter of this description removes by purely mechanical sifting all suspended matter, but it has little influence on dissolved organic impurities. Thick layers of sand, however, retain a good deal of dissolved mineral matter, such as common salt, and are said effectually to separate lead in solution. The sand in such F. beds gradually becomes encrusted with matter deposited from the water, and requires repeated cleaning or renewal.

In dealing with water on a smaller scale, it is possible to adopt many other expedients for F., and among the substances employed, nothing is equal in importance and efficacy to animal charcoal. The charcoal employed is freed by the action of acid from the phosphate and carbonate of lime, and it should be so compacted that the water is kept from percolating through it too quickly. By some manufacturers the charcoal is compressed into solid blocks. Wood and peat charcoal are also employed, and the charcoal obtained in Stanford's process for treating seaweed has also been shown to be an effective filtering agent. Combinations of iron and charcoal, powdered iron ores, manganese, mixed sand and carbon, sponge, flannel, and other woolly substances, have all been used in the fabrication of filters, and numerous patents have from time to time been secured for special forms or arrangements in domestic filters. A filter in extensive use in Paris consists of a series of diaphragms of wool prepared first with alum and cream of tartar, after which they are dyed in a solution of gall-nuts, and washed with sodium carbonate. Of the numerous forms of domestic filter, none is more effective than that shown in section in the accompanying figure, and manufactured by the Port Dundas Pottery Company, Glasgow. In this filter the water passes first through a piece of sponge, which is tightly plugged into an orifice in the upper reservoir. It then meets a stratum (1) of fine gravel A, and (2) of calcined sand B, of a pure white quality, after which it passes through a layer of animal charcoal C, well compacted, and again it percolates through another bed of fine sand D, and of gravel E. For the use of soldiers in campaign, or for travellers, a capital device is the pocket-filter, a small case or box containing animal charcoal, fitted at the top with an elastic tube, and pierced beneath with numerous small holes. The water to be drunk is drawn by suction through the charcoal and tube.



Filter.

Air Filter.—Charcoal has great power of absorbing noxious gases and vapours, a property taken advantage of for catching emanations from sewers, and for disinfecting the air passing out of fever wards in hospitals. Charcoal filters for placing on the mouth are useful in presence of very impure air, as in passing through smoke in a burning house. The filter chiefly recommended for such a purpose contains a layer of pure cotton wool, next the same saturated in glycerine, then powdered charcoal, followed by cotton saturated in glycerine, and dry cotton.

Fimbriated (Lat. *fimbria*, 'a border'), in heraldry, 'edged with a metal or tincture.'

Finale, in music, the last movement in a symphony or other instrumental composition, or the conclusion of the act of an opera. In the latter case its character is determined by the nature of the action; in the former it is always a quick movement.

Fi'nal Judg'ment, a term of Scotch law denoting in its widest sense a judgment which exhausts the merits of a cause, and is not subject to review. But the term in England is more frequently used in contradistinction to the term Interlocutory Judgment (q.v.). See also APPEAL.

Final Perseve'rance of the saints or of the elect is a tenet in the Calvinistic system of theology which flows necessarily from the doctrine of Election (q.v.). The logical chain of which F. P. is the last link is as follows:—From the mass of fallen men God elected a certain number to eternal life. For the salvation of those thus chosen God gave his own Son to become man, to obey and suffer for his people, thus making a full satisfaction for sin, and rendering the ultimate salvation of the elect absolutely certain. While the Holy Spirit in his common operations is present with every man, his certainly efficacious and saving power is exercised only in behalf of the elect. This efficacious grace is irresistible, not only at the time of conversion, but subsequently amid all the frailty and corruption of human nature, because it is the exertion of almighty power carrying out the divine purpose. With these premises it is a moral impossibility that any of those for whom Christ died, and who subsequently become partakers of his grace, can fall from that grace, either totally—so as at any period of their lives to commit sins so heinous, and to persevere in them so obstinately, as to forfeit entirely the divine favour—or finally, so as not to be saved at last. See *Westminster Confession of Faith*; Hodge's *Systematic Theology*.

Finance' means the management of revenue and expenditure, whether on a large or on a small scale, relatively to each other. See DEBT, NATIONAL; BALANCE OF TRADE; BULLION; BANK, BANKING; CAPITAL ACCOUNT; and DOMESTIC MANAGEMENT. The word *finance* denotes money itself.

Finch, a term applied indiscriminately to a large number of small song-birds, belonging to the order *Insessores* (q.v.). The family *Fringillidæ* is that which includes the great majority of the typical finches. (See CHAFFINCH, BULLFINCH, &c.) The *Fringillidæ* form a family of the *Conirostres* (q.v.).

1, Mountain Finch; 2, Green Finch.

Find'horn, a river of Scotland which rises in the Monadliadh Hills, Inverness-shire, flows through the counties of Inverness, Nairn, and Moray, and after a course of 90 miles enters the Moray Firth. The scenery along the F. is very fine. The river is broad and shallow, and often dangerous in flood. The village of F. (pop. 562 as against 605 in 1881), in the county of Moray, at the mouth of the river F., has large herring-fisheries.

Finding Goods, Law Regarding. If the finder appropriate goods believing that the owner cannot be found, and believing the goods to be lost, or if he vainly endeavour to find the owner and after doing his uttermost he appropriate the goods to his own use, the act is not theft; but if he believe the owner can be found, the act is larceny.

Fine, in English law. This was an amicable composition by leave of the court, by which lands were declared to belong to one of the parties claiming them; and by it all the parties were barred who did not claim within a short period. But 3 & 4 Will. IV. c. 74 abolished fines and recoveries, and substituted more simple modes for assuring lands and barring estates tail. F. is also a sum of money paid for the grant of lands by lease, or on the admission to a copyhold interest. F. also signifies a pecuniary penalty imposed by a court of justice for an offence against the law.

Fin'gal, more properly **Fionn,** the great hero of Gaelic, as Arthur is of Cymric, romance. It is impossible to determine whether he belonged to Ireland or to Scotland, or what was the exact period in which he lived, while some even maintain that he existed in name only. But if every national hero is a real person, however much his attributes be exaggerated by popular imagination, then perhaps the historical reality of F. may be conceded. In the *Book of Deer* (12th c.) we have mention of the *Féine*, *i.e.*, the followers of Fionn; he is represented as frequenting both the N. of Ireland and the N.W. of Scotland. There are many old heroic ballads, belonging alike to Ireland and to Scotland (see Campbell's *Book of the Féine*), in which F. is celebrated both as a great warrior and as a generous man; but in Ossian (Macpherson) the Gaelic muse has adorned him with every quality which can raise admiration or call forth affection. See OSSIAN.

Fingal's Cave. See STAFFA.

Finger-Board, in various stringed instruments, a piece of wood—generally ebony—lying underneath the strings, and upon which they can be pressed by the fingers so as to give the sounding part of them the required length.

Fin'ial (Lat. *finis*, 'end'), the ornamental termination which in Gothic architecture usually surmounts and completes the design of spires, pinnacles, gables, the canopies of windows, porches, &c. By early writers the term was used to denote the pinnacle, canopy, or gable itself, as well as its ornamental termination. Finials proper first came into use in the 12th c.—although in the buildings of the ancients there are traces of foliated and other terminations surmounting the pediments—and during the 13th c. they were brought to perfection as an architectural ornament. During the 15th and 16th centuries it was customary to surmount finials with a gilded vane. Stone, wood, and metal were the materials in which these ornaments were carved; but the F. of modern times is usually a pyramidal termination in light metal-work, the designs being generally foliage and scrolls.

Fi'ning. Some liquids holding impurities in suspension are cleared by straining through a porous body (see FILTRATION); others again, such as beer and wine, are clarified by adding substances which either precipitate or raise to the surface the impure matter; the latter process is termed F. The chief finings used are albumen, gelatine, blood, lime, acids, and alcohol. Beer and wines are clarified by dissolved isinglass, which combines with the tannic acid of the liquors, and subsides to the bottom, along with the impurities, in the form of a flocculent mass. In the case of wines containing little tannic acid, such as Burgundy, extract of nut-galls is added with the isinglass to the wine, to prevent decomposition by robbing the wine of one of its natural preservatives. White wines are cleared in Spain with powdered marble; gypsum and sand are elsewhere used. Lime or alum greatly assists the precipitation of impurities in beer or cider. The juices of plants may be clarified by heat, which calls into action the albumen present in them. Syrups are fined with white of egg, which coagulates with heat, and rises with the impurities, forming a scum on the surface.

Finistère′ or **Finisterre** (Lat. *finis terræ*, 'land's end'), the most westerly department of France, once a portion of the province of Brittany, and lying between the English Channel and the Atlantic. Area, 2595 square miles; pop. 727,012. The climate is damp and dull. F. is a wild, hilly district. The coasts are deeply indented, and lined with rugged granite rocks; the interior is partly rich arable land, partly marshes and wide heaths. F. is watered by many small rivers, the chief being the Penzé and Aberbenoit, flowing into La Manche; the Odet, Arven, and Ellé, running S.; and the Aulne, Elorn, and Penfeld, flowing E. Barley, wheat, rye, flax, and hemp are largely cultivated, and much cider is made. There are valuable mines of silver and lead, iron and zinc are found, and granite, marble, and slate are extensively quarried. Bees, deer, and partridges are abundant, and salmon, lobsters, prawns, oysters, trout, and eels are very plentiful. There are several mineral springs in the department. Beer, cheese, butter, and wine are made for home consumption and are also exported in great quantity. The pilchard fisheries off the coast employ many of the inhabitants. The chief manufactures are of linen, canvas, ropes, leather, paper, pottery, sugar, soap, and tobacco; there is also some shipbuilding. F. comprises five arrondissements; the principal towns are Brest (the capital), Quimper, Châteaulin, Morlaix, and Quimperlé.

Finisterre, Cape (Lat. *finis terræ*, 'land's end'), a cape on the N.W. of Spain, in the province of Coruña. Mariners have been warned time after time to keep away from this part of the coast, as vessels are often taken out of their course by the strong current setting eastwards, and several have been lost between C. F. and Cape Ortegal; yet the desire to save time and coal induces some every year to risk destruction by steering close to these headlands. F. was the Roman *Artabrium*, from the *Antabri* who dwelt there.

Fin′land (called the Grand-Duchy of F.), the most north-westerly division of Russia, is bounded W. by Sweden and the Gulf of Bothnia; N. by Norway; E. by the Russian governments of Archangel, Olonetz, and St. Petersburg; and S. by the Gulf of F. It is about 750 miles from N. to S., and on the average about 185 miles broad. Area, 144,255 sq. miles; pop. 2,412,135, 85 per cent. being Finns, 12 per cent. Swedes, and the rest Lapps, Russians, and Germans. The northern part of F. is a portion of the ancient European division of Lapland. The shores of F. are much indented, and enclosed with belts of islands; the interior is a plateau 500-700 feet high, precipitous towards the S., more level in the W., and sloping almost imperceptibly to the N. and E. In the N.W. part there are mountains of 2000 feet. F. consists in general of a mass of granite interspersed with trap, and yields some copper and lead, and many useful kinds of stone. Nitre, sulphur, arsenic, and iron are also found. The vast number of lakes and swamps, covering 18,471 sq. miles, gave rise to the native name of F.—*Suomesimaa*, or 'fen-land.' The chief lakes are Ladoga, Saima (which drains two extensive chains of lakes, the largest among which are Kalla on the W. and Pieli), Näsi, Ulea, and Päjäne, with the Kymene as its outlet into the Gulf of F. The other chief rivers are the Tana, running into the Tanafjord in the Arctic Ocean; and the Tornea Kemi, Simo, Ijo, and Kumo, which fall into the Gulf of Bothnia. The climate of F. varies greatly, the mean temperature of Abo, under 60½° N. lat., being 40° F.; while that of Enontekis, under 68½° and 1370 feet above sea-level, is 27° F. The comparatively high summer temperature (that of Abo is 60° F.) has great influence on vegetation. F. is said to contain 1000 flowering plants. Corn is cultivated S. of the great lakes, but also to some extent in the fen-country, and even further N., and the oak thrives on the Kumo, and about Biörneborg. In the extensive woods covering most of F. are found bears, elk, wolves, foxes, martens, and wildfowl, and the rivers and lakes abound in fish. Before the colonisation of F. by the Swedes, it was inhabited by petty tribes, the names of some of which survive in the names of the old provinces—*e.g.*, Oesterbotten, at the N. end of the Gulf of Bothnia, inhabited by the Kainu or Quains; F. proper, or Suomi, by the Suomians; Tavastland, by the Tavastians or Hæmians; Savolax and Karelia, by the Savolaxians and Karelians. F. is now divided into eight governments:—Nyland, Abo-Biörneborg, Tavastehus, Vasa, St. Michel, Viborg, Kuopio, and Uleaborg. The prevailing religion is the Lutheran, but about 40,000 Finns belong to the Greek Church. There is one university in F. at which some 1700 male and 50 female students are under instruction. In other respects, the education of the people receives great attention, as there are 31 lyceums, of which 22 are supported by the state, 1 polytechnic, 7 navigation schools, 1010 normal, higher, primary, commercial, evening, &c., schools, having an attendance of some 450,000 scholars. Agriculture, dairy management, and trade have special schools. The income derived from the Crown forests is over £400,000.

In the 12th and 13th centuries F. was subdued by the Swedes, and gradually received Christianity and culture from its conquerors. While a Swedish province it often suffered from the wars with Russia, of which it was the theatre. The Peace of Frederikshamn, in 1809, gave the country to Russia, and fixed the Tornea as the Swedish boundary. Under Russian rule the ancient constitution has been slightly modified in 1869 and 1882. There are four social and political classes—nobles, clergy, burgesses, and peasants, the last mostly freeholders. Representatives of these constitute four chambers of the national parliament which is called by the Grand-Duke, who is the Emperor of Russia, to sit during four months, every four or five years. New taxes and constitutional changes require the unanimous vote of each chamber and are liable to be vetoed by the Emperor. There is a state Secretariat of F. at St. Petersburg, and a Senate sits at Helsingfors and administers most of the internal arrangements. Military service is compulsory, and 4833 riflemen and one regiment of dragoons are supplied in this way. On the whole F. has a perfectly independent internal government, with special customs-frontiers and financial arrangements. For the budget of 1894-95 the revenue and expenditure were (each) estimated at £1,791,106, with a public debt of £3,000,000, two-thirds of which was contracted by extensive construction of railways. Russian garrisons lie in the fortresses, but all public functionaries must be natives of F. There is a naval yard at Abo. The Finns are good seamen; their merchant shipping consists of 2193 vessels, representing 257,854 tons. There are 1302 miles of railway open, all but 20 belonging to the state. Canal traffic is considerable, and from this an annual revenue of £24,000 arises. The chief imports are coffee, sugar, iron and hardware, raw cotton, tobacco, corn and flour, oils, &c.; the exports are butter, timber, paper, iron goods, leather, hides, pitch, tar, cottons, &c. Wheat, barley, rye, oats, peas, sarrazin, potatoes, hemp, and flax are the principal crops; large numbers of horses, cattle, sheep, swine, reindeer, goats, and poultry are reared. The chief towns are Helsingfors (q.v.), Abo (q.v.), Viborg (pop. 20,763), Biörneborg (pop. 10,297), Tammerfors (pop. 20,132), Uleaborg (pop. 12,665), Nikolaistad, and Kuspio. See FINNS.

Finland, Gulf of, that part of the Baltic, 240 miles long, and from 10 to 70 miles wide, stretching from W. to E. between the coasts of Finland, St. Petersburg, and Esthonia. Its waters are only slightly salt. Along the Finnish coast it is studded with islands, rocks, and shoals, which render its navigation difficult. There are several excellent harbours, as Kronstadt and Revel, which, with Sveaborg, are also fortresses of the first rank.

Fin′lay, George, LL.D., a distinguished historian, was born in Scotland early in the present century, and in 1822 went out to Greece and fought in the cause of Greek independence. He then settled near Athens, and after an unsuccessful effort to better the state of agriculture in the country, devoted himself to writing the history of Greece from the time of Alexander, when he believed the history of the modern Greek nation began, down to the present day. An ardent Philhellene, he did not shrink from exposing the weaknesses of Greece in a series of shrewd, bold, and vigorous letters to the *Times*, which occasionally gave offence both in England and in Greece. His works were coldly received, but his studious zeal remained unchilled. He died 26th January, 1875. F.'s chief writings are *Greece under the Romans; History of the Byzantine Empire; History of the Byzantine and Greek Empires; History of Greece from its Conquest by the Crusaders to its Conquest by the Turks; History of Greece under Othoman and Venetian Dominion;* and *History of the Greek Revolution.* These works revolutionised our ideas of mediæval Eastern history, disclosing for the first time the true nature of the Eastern empire, and also shedding fresh light on the annals of modern Greece. They show deep, accurate learning, vivified by the author's strong practical intellect and generous love for the country, much of whose history he was the first to unfold to Western Europe.

Fin'mark, or **Finmarken,** a province (*amt*) of Norway, and the most northerly part of Continental Europe. Area, 18,296 sq. miles; pop. 29,170. F. is a high barren tableland traversed by a range of snow-clad mountains, rising to a height of 4000 feet; its coasts are thickly studded by rugged islands (terminating in the N. Cape), and indented by wild narrow fiords, of which those of Porsanger, Laxe, and Tana are the principal and most northerly. The Tana and its tributary, the Karas, and the Alten, are the chief rivers. Barley and potatoes are grown near the sea, and the uplands support large herds of reindeer. The cod-fisheries occupy most of the inhabitants, and are very valuable, above 20,000 barrels of cod-liver oil being, on an average, annually produced. The inhabitants are partly Norwegians, but mostly Finnish-Lapps. The chief town is Hammerfest (q.v.).

Finn'er Whale, a name given to various kinds of whales belonging to the family *Balænidæ* or whalebone whales, and derived from their possessing a soft dorsal fin. Finner whales are of large size—the *Physalus Boops* or rorqual sometimes attaining a length of 90 or 100 feet. They are represented by the genera *Megaptera*, *Balænoptera*, in addition to *Physalus*. They are also named 'furrowed' whales, from the fact that the skin is plaited or folded. The whalebone plates are very small and commercially unimportant.

Finn'ish Language and Literature. Finnish, the most perfect of Ural-Altaic languages, is so rich in declensions and conjugations that Schwarze and Europæus class it among inflective rather than 'agglutinating' forms of speech. But its main characteristics discountenance the theory of its Aryan origin. The noun is without inflection, cases (fourteen in all), numbers, and genders being denoted by additional words. The prepositions (none of which are of pronominal origin) take the form of suffixes; and the verb, having only two tenses, a present and a past, expresses the future by adding some word or other which can indicate futurity. The syntax is comparatively rude and formless, and in all its wealth of cases there is scarcely a definite nominative or accusative; yet the language is so musical that Rask called it the 'most harmonious of tongues,' and, with the single exception of Magyar, it is the only branch of the Ugric (see FINNS, FINNIC) stem in possession of a literature. Swedish-speaking Finns fill the chief professional and mercantile positions in Finland. The people are as much Swedish in culture as the Irish are English, a large number of the Swedish-speaking Finns not even understanding Finnish. Yet the language has not wanted cultivation; it possesses translations of the best foreign works of a religious or popular character, and has a curious and ancient folk-poetry of its own. It was long known that there lived amongst the Finns a great number of lyrics known as *Runot* ('Runic songs'). These poems, some of which are late, others are witch-songs from heathen times, are collected under the title of *Kanteletar* (Helsingf. 1840). It was also known that there were *improvisatori* among the Finns, as Paavno Korhoinen (1775-1840), whose poems have been collected from oral recitation into a volume. But in 1835 Lönnrot awoke general astonishment with the discovery that many of these *Runot* could be dovetailed into a true and noble epic, based on the old myths; it came out under the title *Kalevala;* but so many more fragments were afterwards found, that the edition of 1849 comprised thrice as many verses, divided into fifty songs. It was translated into Swedish by Castrén (1841), into French by Le Duc (1845), and into German by Schiefner (1852). In recent years the language has been much studied by the Finns themselves, and the Russian Government's careful encouragement of Finnish literature is well seconded by the eagerness of the peasantry for printed matter in their native tongue.

Finns, Finn'ic. The F. seem to be identical with the *Phinnoi* of Ptolemy and the *Finni* described by Tacitus as leading a miserable nomadic life in the N.E. of Europe, and together with the *Veneti* ('Venedi' in Pliny, the 'Wends') or Slavs (q.v.), bordering on the *Germani*. They are classed by philologists as one of the five sections of the Northern Turanian (q.v.) or Ural-Altaic family. The wide diffusion of F. races at the present day, as well as the allusions to them in Russian and Scandinavian writers, prove them to have been the oldest known inhabitants of Russia and Scandinavia. Yet, like other races composed of detached tribes, not recognising their own unity, they gave themselves no common name, *Finner* being the term applied to them by the Scandinavians and Germans, while the Russians knew them as *Tchud* (Chudians), in which some recognise the famous name of Scythians. Each branch of the F. stem formed a separate community, with its own name and customs. The people composing one of these, living in what is now called Finland (q.v.), named themselves *Suomalainen* (Suomians) or 'swamp-dwellers,' from the character of their country. Now, in the Germanic languages *fen* means swamp, and probably their German name is but a translation of their native name, which contains a word common to the F. tongues; for example, the Lapps, another F. race, call themselves *Samer* or *Sabmer*, and the same root appears in the name of the allied *Samoieds* or *Samoyedes* (q.v.). The ancient F. were in some respects superior to their more powerful neighbours, and though perhaps of shorter average stature, were strongly built and warlike. They were skilful in smelting and working metals, and especially renowned for their sorcery, a peculiar development of a mythology which influenced greatly that of the early Scandinavians, and was the origin of a rich popular poetry amongst themselves. *Fin* was a title of honour given to great Norwegians, and the leading families of Scandinavian kings and gods were traced to F. sources. But the patriarchal life of isolated tribes precluded political organization, and they were never able effectually to join in resisting the attacks of neighbours who at first invaded their lands as robbers of their costly furs, and afterwards as zealous Christian proselytizers. From a remote period Norwegian chieftains levied *Finneskat* ('Finn-tax') in Finmark, a district extending from the White Sea to the banks of the Dvina, the abode of the Bjarmians. Erik the Saint of Sweden subdued Nyland or S. Finland in 1156, and in the 13th c. Swedish Christianity and culture took firm root. After this, Russian conquest began. The princes and merchants of Novgorod penetrated into the country, and wisely developed its resources; it became, so to speak, Russianised, and missionaries gradually converted many of the inhabitants to the Greek faith. The F. were peaceful subjects, and Finland was the first and firmest foundation of the growth of Russia. The Esthonian and Livonian F. fared worse, for they fell into the hands of German nobles, who treated them as serfs. Of all the F. races, the Magyars alone attained autonomy, and that not in their native country of the Ural Hills, but in Hungary, which had a political existence before they conquered it. Generally speaking, all the other F. tribes have become scattered among greater peoples, but their dialects remain as oases of speech, though the races themselves are but fragments of what they once were. Their name has been applied with some confusion. By Norwegians it is often given to the 17,012 Lapps in Norway. Europe in general confers it only on the inhabitants of the Grand-Duchy of Finland. Ethnologically, it is used of the whole class of which the F. and Lapps are members, but philologists would now denote this class by the Russian name *Chudic*, or the also Russian *Ugric*. The latter seems preferable, from its connection with the name

Ungarn (Hungary), used in the Middle Ages to denote a great province in the N.E. of Europe and W. of Asia.

Fins (allied to the Lat. *pinna* or *penna*, 'a feather'), the structures found typically in fishes, and which are adapted for locomotion in water. They are also found in certain mammals, as in whales and *Sirenia* (q.v.), the former having in some instances (see FINNER WHALE) a back or dorsal fin, and the latter a tail-fin. The pectoral or breast fins of fishes correspond to the fore-limbs, and the ventral fins to the hind-limbs, of other *Vertebrata*. The dorsal, hind, and caudal fins have no correspondence or homology with limbs, but are to be regarded as special developments of the skin in the middle line of the body. The swimming paddles of seals, walruses, &c., correspond to the pectoral fins of fishes, and represent the fore-limbs modified for locomotion in water.

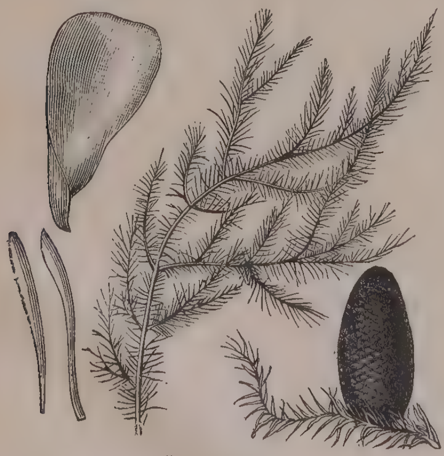
Fins'bury ('fen town'), a parliamentary borough of Middlesex, consisting since 1885 of three divisions, Holborn, Central, and East, each returning one member, and having a pop. of 70,911, 66,216, and 45,327 respectively. Pop. reg. sub-dist. 4985.—The pop. of the district or ecc. par., known as Finsbury Park, Islington, is 5988. The park itself is a fine stretch of enclosed land, laid out in grass plots, shrubberies, flower beds, recreation grounds, &c. A boating lake is in the centre, the banks of which command one of the finest views in the N. of London. The locality is exceedingly healthy, and for that reason is deservedly popular.

Fin'scale. See RED EYE.

Finsteraar'horn (Ger. 'the horn of the dark Aar'), so called because the dark Aar rises from it, the highest peak in the Bernese Alps, 14,106 or 14,026 feet high. It can be mounted from Faulberg, five miles distant from Lake Majelen. The mountain is surrounded by large glaciers.

Fin'sterwalde (Ger. 'dark wood'), a town in the province of Brandenburg, Prussia, 40 miles N. of Dresden, with manufactures of linen, cotton, flannel, and machinery. Pop. 8220.

Fi'orin. See BENT GRASS.



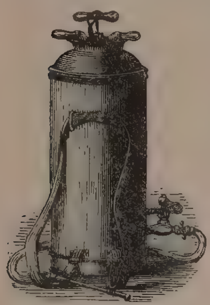
Great Silver Fir.

Fir (Old Eng. *furh*, comp. Ger. *föhre* and Welsh *pyr*), a name given generally to many species of trees belonging to the natural order *Coniferæ* (q.v.). It may be botanically restricted to the species of the genus *Abies*, which also include the Spruce (q.v.); but many pines are also so denominated—the Scotch F. being one of the most familiar examples. In the genus *Abies* the leaves are arranged singly, and are flat, whilst the scales of the cones are deciduous. Nearly allied to *Abies* is the genus *Picea*, or that represented by the silver firs, this latter genus having tetragonal leaves and persistent cone scales. Of the F. the Norway spruce or F. is a good example. This tree attains a height of from 100 to 180 feet, and has an erect stem, whilst its branches are given off in the markedly symmetrical manner characteristic of these trees as a whole. It grows in Northern Europe, Asia, and even in the Arctic circle, and lives about 400 years. It yields *common frankincense* or *Thus*, and paper has been manufactured from its wood. Like most other species of F., it also yields resin, turpentine, tar, &c. The wood is very durable, and is known as *Danzig deal* and *white Christiania deal*. The soft sapwood is occasionally eaten in Sweden. Other species belonging to the genus *Abies* are the balm of Gilead fir and the Canadian fir, from which 'Canada balsam' is obtained. The leaves of the latter, which is known as hemlock spruce, and also those of the black fir, yield the extract used in spruce beer. The silver F. affords Strasburg turpentine. The white spruce is very common in N. America. The giant pine of California thrives in Britain, and may attain a height of 245 feet with a circumference of 57½ feet at a height of 3 feet from the ground. The great silver fir occurs on the N. Pacific coast of America; it is a hardy grower and makes excellent lumber for export trade. To the genus *Pinus* belongs the typical Scotch F., a tall tree with evergreen aciculate or needle-like leaves, naked flowers, and a cone or multiple fruit. The male flowers of the Scotch F. are arranged in short catkins composed of small overlapping scales, each scale having two anther lobes on its lower surface. The female flowers are in small dense catkins, each scale of which has at the base of its upper side two inverted seeds or ovules. The ovules are not enclosed in any seed vessel, and the F. and other Conifers are thus named Gymnospermous or naked-seeded plants. The Scotch F., the only pine now native in Britain, furnishes the wood known as yellow deal. Tar is distilled from it, and pitch is the residuum after the distillation of the liquid part of the tar. The inner bark of the Scotch F. yields the 'bark bread' of Norway. The firs, which are of Arctic type, flourish under conditions which would be fatal to the growth of other trees of their size. See PINE.

Fir Bholg, signifying 'men of the quiver,' a name given to one of the various tribes who invaded Ireland in prehistoric times. The S. of Ireland is sometimes called Bolga, and it is sought to identify the people with the Belgæ.

Firdu'si, Firdousi, or **Firdewsi, Abou'l-Casim Mansour,** a great Persian poet, was born at Schadab, near Tus in Khorassan, in 940. He was called F. ('paradise') either from his father being in charge of an estate named F., or from the Sultan Mahmud saying that his poems were a true 'paradise.' F. early determined to frame an epic on the history of Persia, visited the court of the Sultan Mahmud at Ghuznee, then a famous seat of letters; and at Mahmud's request undertook to write an epic on the Persian kings from mythical times down to the 7th c., the sultan promising him a gold dirhem for each couplet. The work is said to have occupied F. for thirty years, and on its completion, Mahmud, prejudiced against F. by the poet's enemies, sent him 60,000 dirhems of silver, instead of the gold coins which he had promised. In return F. bitterly satirised Mahmud, whose resentment compelled him to wander from court to court, seeking protection which the various monarchs dared not bestow. F. seems to have died in his native place, about 1020. His life, and especially his latter years, are shrouded in legends, the stories regarding him being often very contradictory. F.'s great work, the *Shah-Nameh* ('Book of Kings'), is said to have at first contained 60,000 couplets, but no extant MS. comprises more than 56,685. The poem deals with mingled fable and history, and embraces 3600 years. It has no epical unity, being divided into separate tales, to each of which an introduction and epilogue are affixed. The chief theme is the war of Iran (Persia) with Turan (Turkestan). In the East it is regarded as of great historical value, but the only reliable portion seems to be that devoted to the Sassanids. It is one of the most interesting philological relics in Persian, is pure, though archaic, in style, with very few Arabic words. Sir William Jones says if it were understood in the original, it would 'contest the merit of invention with Homer himself.' It abounds in rich, daring, and often fantastic Oriental imagery, contains many fine passages of lofty and pathetic poetry, and its verse is softly musical. The *Shah-Nameh* was published in Calcutta in 1829, edited by Turner Macan, and at Paris in 1840, with a translation and commentary by Mohl.

Fire-Anni'hilator, a portable machine designed to extinguish fire by forcibly ejecting upon the burning mass a saturated solution of a gas or of other substances incapable of supporting combustion. The French call such a machine *l'extincteur*, a name which has been adopted by inventors in Great Britain. Phillips's F.-A. (1849), contrived to project steam, carbonic acid, and other gases, has not been much used. In 1873 W. B. Dick, of Glasgow, patented an extincteur, which consisted of a cylindrical vessel containing water saturated with bicarbonate of soda in the lower part, and in the upper of a bottle filled with sulphuric acid. The bottle may be readily broken by percussion applied to an external cap, and the ensuing chemical action of the acid on the bicarbonate produces carbonic acid, which by its own expansion is propelled through a stop and delivery hose as a supersaturated aqueous solution. Many public buildings, ships, &c., have been provided with this extincteur. A novel and ingenious plan of extinguishing fires in buildings where steam power is used was patented in 1875 by Henry Lacey of Hebden Bridge, Yorkshire. His method was to connect a branch pipe, which might be carried to any part of the building with hose attached, to the water-supply pipe leading through an injector to the boiler of an engine. By means of stopcocks, the water was cut off from the boiler; and steam, being admitted into the injector, drove the water along the branch pipe with a force regulated by the pressure of steam. Provision was also made for mixing chemicals with the water in the branch pipe.



Fire-Annihilator.

Fire'arms. The discovery of Gunpowder (q.v.) and its application to purposes of war led soon to the disuse of the old weapons of attack. The earliest form of goune (*canna*), or 'crake of war,' was probably an iron pot or 'mortar.' This gradually changed into a cylinder form, which may have been suggested by the practice of throwing 'feathered quarrels.' The early Cannon (q.v.) of the 14th c. were made of wrought-iron bars bound by iron girders, the shot used being generally stones. The larger cannon, Froissart's *grande artillerie*, subsequently called *bombardes*, of which Mons Meg at Edinburgh Castle is a specimen, projected granite balls. Some of these were breechloaders, and the largest could throw 200 lbs. It is said the Dulle Griette or Margot la Folle of Ghent, and Mahomet II.'s gun at Constantinople threw (each) 600 lbs. In the 15th c. appear primitive *mitrailleuses*, called by the Germans 'death-organs,' and the lighter pieces for field-work with trunnions mounted on carriages with trails. At the end of the 15th c. hand-guns called culverins were used, two men for each; smaller petronels being supplied to the cavalry. Gustavus Adolphus (1630) first introduced small iron cannon for field purposes. In the middle of the 16th c. Henri II. of France had cannon of 34 lbs., culverins from 15 lbs. to 2 lbs., and falcons and falconets which threw small shot of 1 lb. and ½ lb. Grooved or rifled cannon (see RIFLED ARMS) occur in the 17th c., so that Benjamin Robins, who lived in the following century, was not the author of the idea. The long harquebus, and the longer and heavier muschite, or sparrow-hawk, which was fired from a rest, were both of Spanish origin. The old matchlock gradually gave place to the clumsy wheel-lock of Nürnberg and the snaphaunces, but not till about 1692 did the developed flintlock entirely supersede the matchlock. Casting guns was introduced to England by Sebastiani, under the patronage of Henry VIII.; many of the brass 'sakers' of that period still survive. The petard of this period was a kind of iron mortar, like a truncated cone, filled with gunpowder and yellow wax, or Greek fire. It was used for blowing up gates and bridges. There was a separate tube to carry the lighted match. Bombs were known in England in the 16th c. Ricochet-firing was first tried by Vauban at Philipsbourg in 1688. The bar-and-chain shot used in naval warfare were generally fired out of the guns called 'murtherers.' Many forms of hand-F. we have not yet mentioned. The iron hand-cannon, with a small pan under the right side to hold the powder, passed into the hand-gun proper cast in brass, the first step towards the gunlock. The *arquebus-à-croc*, or with a hook, was fired from a tripod, and therefore is not properly a hand-arm. The smaller haquebut, or hagbut, had a hooked or crooked stock, which gave greater facilities for aiming than the straight barrel. The demi-haque was merely a long pistol, with a semicircular butt. The musket (literally the male young of the sparrow-hawk), perhaps so called from mousquette, or muschetta, the iron part of the small arrows fired from guns, has been referred to a Russian as well as a Spanish origin. It was first largely used by Alva. The ramrod was called 'a scouring stick' or 'scorier'; and indeed wooden ramrods were used in the British army down to 1752. The so-called Vauban lock (really much older) was an attempt to combine the action of a flint and steel with that of a matchcord. The caliver was a short musket fired by a matchlock without rest. The name really refers to the calibre or bore—the height of the bullet—and marks the important change that all the men of a regiment must use the same ammunitions. The Fusil (q.v.) was a short musket (flintlock) used by the French army from 1700; it was fired not from the breast, but the shoulder. The Carbine (q.v.) was a wheel-locked arquebus of large calibre used by skirmishers in the French army (1576 to 1665) and by the English cavalry at the end of the 17th c. The currier was longer in barrel than the arquebus, but not of so wide a bore; it was used chiefly in sieges. The musquetoon was a smaller sort of musquet, not so long as the fusil, but differing from the carbine in having a firelock, and not a wheel-lock. The Pistol (q.v.) was an arquebus in miniature, and fired by the wheel-lock. It was much used by the German Reiters, and in one form with a snaphaunce lock in the Scotch Highlands. The dag was simply a pistol with a crooked stock. The petronel or petrinal (from *poitrine*, 'breast,' from which it was fired) was a sort of arquebus, shorter than the musquet, but of larger bore, in fact very like the modern carbine. The Blunderbuss (q.v.) was very short, with a wide bore, and was charged with several balls or slugs. The dragon (see DRAGOON) was a formidable small form of the blunderbuss; it was conveniently carried on horseback, and effectively used on foot. The hand-mortar was used for throwing shells or Grenades (q.v.). The patent of Forsyth for a percussion gun (1807) was followed in 1827 by Dreyse's invention of the needle-gun, which in 1836 was converted into a breechloader. In the Minie rifle the charge in exploding expanded the head of the bullet, a result formerly obtained by the pressure of the ramrod, or more anciently in the rifled harquebus by a mallet. The chief forms of the needle-gun besides the German are the Chassepot, the Snider, the Peabody (Swiss), the Werndl (Austrian), and the Remington (Danish), &c. (See BREECHLOADING ARMS.) The recent improvements in large ordnance are noticed under CANNON. Among great collections of F. may be mentioned those of Dresden and the Musée d'Artillerie at Paris. Birmingham started one, which received help from the Government. The only large private collection in this country was that of Meyrich at Goodrich Court. As in France and Germany greater advance has been made in small arms, such as rifles, useful in war, so in England have more perfect sporting weapons been supplied. Our best rifles now carry with precision to a distance of 2000 yards or more, while the range of the ordinary shot gun is 45 yards, and that of the duck gun 140 yards. The names of the successful makers and all the little improvements within recent years in F. are too numerous for mention to be made of them in our limited space, but the reader is referred to the works of such experts as Walsh, Greener, &c., for full information on the subject.

Firearms, Law Regarding. Before firearms are sold or offered for sale they must be tested in a public proof-house. The statute does not extend to Scotland or Ireland, and arms manufactured for the Queen are exempted. See Statutes 18 & 19 Vict. c. 148, repealed by 31 & 32 Vict. c. 148, which granted more extensive powers, &c., in view of proving guns and stopping the forgery of proof-marks, to the Gunmakers' Company and Guardians of the Birmingham Proof House. Statute 33 & 34 Vict. c. 57, instituted a duty of 10s. for every license to carry a gun or pistol.

Fire'balls, hollow projectiles filled with gunpowder, sulphur, naphtha, and similar combustibles, and discharged from cannon to illuminate or ignite an enemy's work. Rockets have greatly superseded their use.

Fire'bote, in English law, is the right of a tenant to cut wood for fuel on the ground held by him. See ESTOVER.

Fire'brick. See BRICK.

Fire-Brigade'. In London up to 1825 almost the whole of the fire-engines were under the control of the insurance companies, and each company had its own brigade; but in that year some of the principal associations joined together. The advantages of conjoint action soon became so obvious that by 1833 nearly all the companies had merged their establishments in the central one, but in 1862 the Government was informed that the committee of management had determined upon relinquishing the maintenance of the brigade. The present Metropolitan F.-B. was formed in January, 1866, in accordance with the provisions of an Act of 1865, under Sir (then Captain) Eyre M. Shaw, C.B. This brigade was placed under the control of the Metropolitan Board of Works, and received support from the rates, the Treasury, and the insurance companies. The rate was ½d. in the pound on the annual value of property rateable to the relief of the poor in the Metropolis. In 1889 it comprised 591 men and 55 land engine stations, besides four floating steamers. In 1889-90 the brigade was greatly strengthened and increased. It is now under the control of the County Council.

The officers and men number 741; there are besides 17 pilots, 75 coachmen, and 137 horses. Of these 458 are on duty during every 24 hours. The *matériel* consists of 57 land stations, 4 floating stations, 52 hose-cart stations, 181 fire-escape stations, 9 steam fire-engines (barges), 50 land steam fire-engines, 95 engines worked by hand, besides 8 steam tugs, 13 barges, 12 skiffs, 221 fire-escapes, 9 ladders (extra length), 9 ladder vans, 2 ladder trucks, 105 hose-carts and hose-reels, and 34 miles of hose, &c. The area, that is so protected is 118 sq. miles, includes the city and county of London, and extends from Roehampton to Plumstead, and from Sydenham to Highgate. The stations are connected by telephone with each other, and with police stations, public buildings, and fire-alarm street instruments. The annual cost is about £130,000. The number of fires in 1894 was estimated at 3410, and of these 180 resulted in serious damage. The chief officer is Captain J. Sexton Simonds, who fills the position formerly occupied by Sir E. M. Shaw. Headquarters are in Southwark Bridge Road. In Liverpool, Manchester, Edinburgh, Glasgow, and most cities in the United Kingdom, there are now highly-trained and well-organized F.-Brigades. On the Continent the fire establishment is generally under Government control; in America there are in most cities companies of firemen, permanently employed and paid, and the system is the most perfectly organized in the world. In our smaller colonies, such as the Straits Settlements, where the number of Europeans is small, the F.-B., if any exists, is necessarily on a small scale; and consequently the services of the military are requisitioned. At Singapore the discovery of a fire at night is announced by the repeated discharge of cannon from the central fort, and the firing of several rockets in indication of the quarter where the conflagration may have arisen. To the uninitiated traveller this sudden bombardment may seem to announce the revolt of the 100,000 Chinese, or the approach of a French, or a Russian, hostile force *at last*.

Fire'clay is so named from its fire-resisting nature, which arises from the predominance of silica together with the small percentage of fluxes in its constitution. Pure F. is composed of silica, alumina, and water; but an alkali, lime, magnesia, or iron oxide is always present in variable proportions, tending to give fusibility to the clay. F. with over one per cent. of alkalies is unable to withstand very high temperatures for a prolonged period, but oxide of iron alone, to the extent of four per cent., is not detrimental. In Great Britain it is chiefly found in the coal measures, in beds of from 1 foot to 4 feet in thickness, forming the under clay of the coal seams. Valuable deposits occur at Stourbridge in Worcestershire, Garnkirk and other places in Lanarkshire, at Lilly Hill in Fifeshire, and at Blaydon on the Tyne. Stourbridge is the most celebrated of the British fireclays, and has the following percentage composition:—Silica, 63·30; alumina, 23·30; lime, 0·73; oxide of iron, 1·80; water, 10·30, with traces of titanic acid and carbonaceous matter. Gas retorts, glass-house pots, crucibles, furnace bricks, glazed drainage pipes, terra-cotta ornaments, and many other articles are made of F. When excavated, it is exposed to the disintegrating action of the weather; it is afterwards pulverized, mixed with water, kneaded in a pug-mill, then moulded by hand, and carefully dried and fired.

Fire'damp, an explosive mixture of Marsh Gas (q.v.) and air, is of frequent occurrence, and a source of great danger, in coal mines. See SAFETY-LAMP.

Fire-Eating. Conjurors have at different times professed their ability to eat fire with impunity. Richardson, an Englishman, who travelled over Europe in the 17th c., chewed burning coals, poured melted lead upon his tongue, drank molten glass, and held red-hot iron in his mouth. Sir David Brewster (*Letters on Natural Magic*), commenting on these and similar performances, says, 'That these effects are produced partly by deception and partly by a previous preparation of the parts subjected to the heat, can scarcely admit of a doubt. The fusible metal—composed of mercury, bismuth, and tin, which melt at a low temperature—might easily have been substituted in place of lead, and fluids of easy ebullition may have been used in place of boiling water.' The skin becomes horny, and therefore insensible to intense heat, by continually compressing, singeing, or pricking it, or by frequently washing it with dilute sulphuric acid. Mediæval priests were acquainted with other protective preparations, which enabled them to pass 'the innocent' through the ordeal of fire with impunity.

Fire'-Engine, a pumping-machine for extinguishing fires. A double pump apparently for this purpose is described by Hero of Alexandria (B.C. 284-221), who calls it 'the syphons used at conflagrations.' There are now no means of saying how far such a machine (which was in principle identical with those employed at present) was used in the time of its inventor. We first hear of fire-engines definitely during the latter half of the 17th c., when they appear in very much the same form as that described by Hero. Up to this time huge squirts containing a few quarts of water were the principal means of extinguishing fires in this country. Two men held one of them, and a third pressed the piston upwards. The first F.-E. of which we have a trustworthy account was made at Nürnberg by Hautsch, and is described by Gaspar Schott in 1657. It carried its own water cistern, was worked by twenty-eight men, and seems to have had a kind of a flexible discharge pipe. The general use of the leathern hose dates only from about 1670, when two brothers Van der Heide (fire-inspectors) introduced them at Amsterdam and obtained for them patent rights. Since then they have been universally employed, first of leather sewed, then riveted, and later of canvas and india-rubber, and of india-rubber alone. The first use of the *air vessel*, now an essential part of all fire-engines, is ascribed to a Frenchman, Perrault, in 1684. Subsequent improvements in the F.-E. down to 1830 were chiefly in details. In that year the first steam F.-E. was used by Braithwaite, who shortly afterwards brought out a more powerful one, and constructed also a *floating* steam F.-E. The use of steam did not make much progress at the time, and it was not until 1861 that Messrs. Shand & Mason made the first steam F.-E. used by the London Brigade. Since that time the steam F.-E. has become more and more important, there being few towns of any size without one or more. One of the largest kinds used weighs about 23 cwt., and can send a jet (200 gallons per minute) to a vertical height of 180-200 feet. These engines are specially constructed so that steam may be raised quickly—in the one just mentioned steam of 100 lbs. pressure per square inch can be obtained seven minutes after the fire is lit; of course this process may be going on as the engine is being driven to the fire, so that no time is lost. The modern F.-E. consists of one or more force-pumps (see PUMP), delivering water into an air chamber communicating with the discharge pipe and hose. By their action the air in the chamber is kept constantly compressed to any desired extent, and reacting by its elasticity upon the water, it forces it out in a continuous stream.

Fire-Escape′, an apparatus for enabling persons in burning houses or buildings to escape. The name is strictly applied to a ladder 30 or 35 feet high, with a canvas trough behind it, and smaller sliding ladders attached to it, by which its length can be increased to 45 or 50 feet, and in some cases even more. The whole is supported in a nearly vertical position on two large wheels, so that it can readily be moved. In London fire-escapes are so placed that almost any house can be reached by one of them in five minutes. They belonged until 1867 to the 'Society for the Protection of Life from Fire' (an association founded in 1836), and were then virtually presented to the new fire brigade. In 1881 a scheme was established by the Charity Commissioners under which the income from the funds of the charity is applied in rewarding persons who save life or sustain injury at a fire, and to the relations of persons who have lost their lives while endeavouring to save life from fire. In our cities, where so many houses have only one narrow stair, communication by which sometimes becomes impossible at the very beginning of a fire, fire-escapes have saved many lives.

Fire-Fish, the name given to certain Teleostean fishes from their brilliant colouration. The best-known species is the red F.-F. of tropical seas, which belongs to the family *Triglidæ* or gurnards. The body is scaly, and has many spines and rays. The dorsal and pectoral fins are especially large, and their rays are prominent. The colour is a pinky brown with dark-brown markings. The average length is 8 or 9 inches. The flesh is eaten on the Ceylon coasts.

Firefly, a name sometimes applied generally to insects with phosphorescent or luminous properties, but restricted in a zoological sense to such forms as the Cucujo or F. of Brazil, the glow-worm, and allied forms. The former insect belongs to the family *Elateridæ* of the *Coleoptera* or Beetle order of insects, and the latter is also a beetle belonging to the family *Lampyridæ*. The F. of Brazil is very luminous, the light proceeding from two spots at the base of the thorax, whilst two other shining patches exist beneath the wing-covers. These insects fly by night, and render the forests bright with their luminosity. Various other species are known. The glow-worm is familiar to all as a luminous insect or F. The females exhibit the utmost brilliance. The female glow-worm is wingless, the male being winged and of brown colour. Fireflies are most common in S. Europe and in tropical countries. How the luminosity is produced is still undetermined in an exact sense, but there appears to be little doubt that it is developed by the nerve-force acting through some special apparatus. See also LUMINOSITY and PHOSPHORESCENCE OF ANIMALS.

Firefly.

Fire Insu′rance, Law Regarding. When there has been damage by fire, notice should at once be given to the office, and an account given on oath or affirmation of the loss. Account-books and other vouchers should be shown in support of the account. To whatever amount persons insure, they can only recover the value of the loss sustained. A house being insured for £19,000 was totally destroyed by fire, but the company, though the premium on £19,000 had been paid for many years, refused to pay more than £12,000, alleging that this was ample value. And this is in accordance with the condition which is usually stated in the contract, namely, that the Insurance Company undertakes to *pay the loss*, not exceeding the sum insured. In fact, the insurer must not hope to make a profit out of his loss by fire. If a policy be effected in several offices on the same subject, they are only liable proportionally to make good the loss, and to guard themselves against a fraudulent insurer insuring for full amount in various offices, it is usually notified in the proposal that he must state any other insurance in existence on the same property, otherwise the proposed insurance will be void. However small the damage to the subject insured, the office is liable; for example, under a policy on furniture, the office is liable for damage by a hot cinder. Most offices pay for damage caused by lightning or gas explosion, but the insurer should inquire as to this. The annual premium on a *common* insurance is usually 1s. 6d. per cent.; that on a *hazardous* insurance, 2s. 6d. per cent.; and that on a *doubly hazardous* insurance is 4s. 6d. per cent. In the two latter there are, of course, many exceptions where the premium is raised; and there are cases where no reasonable premium, however large, will be accepted, the hazard being too great.

Firelock, the name given in the 16th c. to a musket or pistol with a wheel-lock, and afterwards to the musket with a flintlock, which in 1690 was introduced in place of the earlier matchlock. See FIREARMS.

Fire, Malicious Injuries by. See EXPLOSIVES.

Firenzuola, Agnolo, an Italian scholar and writer of fiction, was born at Florence, 28th September, 1493. He studied law at Siena and Perugia, but, while young, became a monk, and in 1525 was made abbot of a monastery at Spoleto. He was a friend of Aretin, is said to have lived a profligate life, and died at Prato about 1545. His chief works are a free adaptation of the *Golden Ass* of Apuleius, *Apuleio, Dell' Asino d' Oro tradotto per Agnolo F.*, which excels the original in beauty of language; *Discorsi degli Animali*, partly imitations of Æsop; *Ragionamenti Amorosi, Novelli Otto*, sportive tales in the choicest Tuscan; *Dialogo delle Bellezze delle Donne*; two comedies, some satirical verses, &c. F. is one of the masters of Italian prose. His language is clear, flowing, and full of colour. See the Life in the edition of F.'s works published at Florence in 1848.

Fire-Proof Buildings. A building is fire-proof only when, in the event of a fire in one compartment, the fire burns itself out there without communicating with another compartment, or endangering the building. Considerable attention has been given to fire-proof construction, yet we have not made much progress in the art. Many buildings believed to be fire-proof, because in their construction brick, concrete, and iron are abundantly used, and wood very sparingly, when subjected to the fiery ordeal, assuredly succumb. The destruction of the London Pantechnicon in February, 1874, is a case in point. Though constructed on the most approved principles, it was wholly consumed in a few hours. That conflagration proved the weakness of iron pillars as supports to brick arches, for they melted with the intense heat, or cracked when water was thrown upon them. In course of time we may be forced to acknowledge that the use of a metal, such as iron, is the weak spot in F.-P. constructions, and that old, well-seasoned, medically treated oak or compressed paper is a far superior material for the purpose. Absolute fire-proof construction can only be attained at a great sacrifice of space. The compartments should be small, with thick firebrick walls supporting groined firebrick roofs. Where large floor areas are required, brick pillars should support the groined roofs. For valuable information on F.-P. B. see the *Transactions of the Society of Arts*.

Fire-Proofing, the art of diminishing the destructive effects of fire on inflammable materials. Textile fabrics are rendered non-inflammable by steeping them in any inorganic saline solution, whereby the fibres are coated with a protective crust that absorbs heat and excludes air. Fabrics so treated smoulder slowly when exposed to a high temperature, but do not burst into flame. For F.-P. light fabrics, phosphate of ammonium, alone or mixed with chloride of ammonium, sulphate of ammonium, or tungstate of sodium is recommended. The last-named is most used for goods that require to be ironed. Little success has attended the efforts made to fix the protective agents in the fibre, by rendering the saline crust insoluble in water. Fire-proof clothing may be made with the fibrous mineral asbestos. The ancients were acquainted with the art of weaving it into garments. About the year 1828, Chevalier Aldini of Milan advocated its use for firemen's dress, in combination with cloth steeped in alum, and with wire-gauze. Wood is rendered incombustible, or nearly so, by painting it with silicate of soda, or by impregnating it with an aqueous solution of alum and sulphate of copper, or of common salt and alum. The following mode of F.-P. wood has been devised:—Sulphate of zinc (2½ parts by weight), American potash (1 part), ammonium alum (2 parts), oxide of manganese (1 part), are mixed in a boiler, and water (2½ parts), at a temperature of 113° F., is run in. When the solution is effected, sulphuric acid (1 part), at 60°, is gradually introduced. The wood for F.-P. is submitted for three hours to the action of the solution, which is maintained in a state of ebullition during that time.

Fire-Proof Safes and other depositories. See SAFES.

Fire-Raising is in Scotch law the equivalent term to Arson (q.v.) in England. To constitute the crime there must have been actual burning, but it does not matter how small a portion of the subject has been consumed. Ignition of furniture alone, when not a fixture (see FIXTURES) of a building, makes the culprit liable to a charge of an attempt at F.-R. Setting fire to one's own house, if so doing is not dangerous to the property of another, and if the act is not fraudulent, may probably not be indictable. Under the Procedure Act of 1887 the points raised as to the state of mind of the accused are: did he raise the fire wilfully, or culpably and recklessly, or to defraud insurers? To set on fire growing crops, or to attempt to do so, is felony by statute. See EXPLOSIVE MIXTURES; GUNPOWDER, LAW REGARDING.

Fireship, a vessel laden with combustible matters, which in maritime warfare was sailed into an enemy's fleet, set on fire, and abandoned, in the hope that it might do damage or create confusion. The F. is of very early origin; we hear of its employment more than 2000 years ago. It is not used in modern warfare by civilised nations, although the Chinese employed fireships unsuccessfully against the British fleet before Canton in 1857.

Fireworks and Squibs. See PYROTECHNY, EXPLOSIVES.

Fire-Worshippers. See GUEBRES.

Fir'kin (Old Eng. *feower*, 'four'—Dan. *fire*—and dim, *kin*), the fourth part of a barrel, equal to seven and a half imperial gallons. In the United States of America a F. means a tub, often of butter, of 56 lbs. in weight.

Fir'lot (Old Eng. *feower*, 'four'—Dan. *fire*—and Eng. *lot*, 'part or portion'), a dry measure Scots, equal to the fourth part of a Boll (q.v.).

Firm. See PARTNERSHIP.

Fir'mament is the Latin word (*firmamentum*) in the Vulgate for the Greek *stereōma* of the LXX. and the Hebrew *rakia* in Gen. i. 6, 7, &c. The literal meaning of the Hebrew word seems to be a thin solid plate which has been hammered out. Similar names for the sky, scientifically incorrect, but expressing its actual appearance, are found in other languages—Gr. *ouranos*, Eng. *heaven*, 'that which is elevated; Gr. *koilon*, Lat. *cœlum*, 'the hollow place'; Ger. *heimeln*, 'a roof.' The Hebrew F., which was supported as if on pillars by mountains (2 Sam. xxii. 8; Job xxvi. 11), served a twofold purpose—first, of supporting a reservoir of water (Gen. i. 7; *cf.* Ps. civ. 3, cxlviii. 4), which descended as rain through windows (Gen. vii. 11, viii. 2; Mal. iii. 10) and doors (Ps. lxxviii. 23); secondly, of supporting the heavenly bodies—sun, moon, and stars (Gen. i. 15). According to the Christian fathers who commented on Genesis, as late at least as the Venerable Bede (8th c.), the earth was a flat plain skirted by mountains, on which the F. was supported like a dome, or stretched like a skin. In short, the fixity of the F. was necessarily combined with the flatness of the earth, a belief in which prevailed till the end of the 15th c., when the attempt of Columbus to prove its rotundity was condemned as irreligious by the Council of Salamanca. See Draper's *Conflict between Religion and Science*.

Fir'man (Pers. *ferman*, 'a command'), the official mandate of an Oriental sovereign, and especially of the Ottoman Porte. It also signifies the passport given to a traveller in the Turkish empire, and in India denotes a certificate giving permission to trade.

Firmilian, St., a bishop of Cæsarea, who successfully opposed the Novatian doctrines and joined St. Cyprian in opposition to Pope Stephen on the question of re-baptizing heretics. An intimate friend of Origen, he was distinguished among the Christian fathers for his exemplary piety. St. F. was president of the Council at Antioch, before which Paul of Samosata was tried. Died A.D. 269.

Firminy, a town in the department of Loire, France, 39 miles S.W. of Lyon by railway. It is surrounded by extensive coal-mines and stone-quarries. Pop. of commune 14,511.

Firola, a genus of Gasteropodous Molluscs belonging to the aberrant group *Heteropoda* or *Nudibranchiata*, in which the 'foot' of other *Gasteropoda* is modified to a flattened fin-like organ, used for swimming, the animals generally moving back-downwards through the water. The shell, at most rudimentary in the *Heteropoda*, is wanting in F. The genus gives the name to the family *Firolidæ*, in which a large body exists, and locomotion is performed by the modified foot, and by a tail-fin in addition. The body in F. is 4 or 5 inches long.

First'-Born. By the common instincts of human nature, which prompt parents to give their affection most fully to their F.-B., pre-eminent importance and privileges have always been granted to the eldest son in a family. According to the laws of most nations he succeeded to the official position and authority of his father, and for the same reason, as well as to enable him to sustain that dignity, received a larger share than his brothers of his father's wealth. According to the Mosaic law he inherited 'a double portion,' *i.e.*, twice as much as any of the other sons (Deut. xxi. 15-17). With the Hebrews, also, a special sanctity attached to the F.-B. both of man and beast, as devoted to the Lord in commemoration of the F.-B. of the Israelities being spared when those of the Egyptians were cut off. (See PASSOVER.) Of the animals, the clean (see Lev. xi.), if free from blemish, were offered in sacrifice (Deut. xv. 21); the unclean, not being fit for sacrifice, were to be put to death, to be sold, and the price given to the priest, or to be redeemed by the owner with a lamb or with six-fifths of its value (Exod. xiii. 13; Lev. xxvii. 11-13, 27). The F.-B. of man were all devoted to the Lord to be priests; but as they were superseded in this office by the Levites (q.v.), it was ordained that the F.-B. of the other tribes should be redeemed (Num. iii. 11-13, 40-46, xviii. 15). This, however, was not the case in some Indian dynasties, where it was the custom for one degree to be used up before the descendant inherited; thus the next younger brother succeeded the deceased, and so on till the stock of brothers was exhausted, when a son of the original king became the ruler. Artists and writers have usually adopted the Jewish system in depicting or describing the last of ten plagues in Egypt, but there would appear to be as much presumptive evidence in favour of the theory that the children were female as against it. The position of the female in Egypt at that time was equal, if not superior, to that of the male; at all events in so far as property and its descent were concerned.

First-Born, Law Regarding. See PRIMOGENITURE, HEIR, SUCCESSION.

First-Fruits. It was a common practice in ancient times to make an offering to the gods of the first of the fruits of the ground that were ripe, as an acknowledgment of their bounty in the past, and to procure from them good crops in the future. Such offerings were made by the Egyptians to Isis, by the Greeks to Demeter, Apollo, and Diana, and by the Romans to Ceres and Bacchus. Among the Hebrews, too, it was appointed by the Mosaic law not only that the first of all the produce of the ground should be offered to Jehovah, but also the first-born both of man and beast (Exod. xxii. 29, 30; Deut. xxvi. 2-11). (See FIRST-BORN.) Special occasions for the offering of F.-F. were—(1) At the Feast of the Passover, when the first sheaf of the harvest was brought to the priest, and by him waved before the Lord (Lev. xxiii. 5-12; (2) at the Feast of Pentecost, when a similar offering was made of two loaves of bread made from the new flour (Lev. xxiii. 15-17). Besides these public or national offerings, private offerings were to be made of the first-thrashed grain, of a cake of the first-ground meal (Num. xv. 17-21), of the best of the wine and the oil (Num. xviii. 12, 13), and in short, 'of all the fruit of the earth' (Deut. xxvi. 2). All these offerings fell to the priests, as part of their living (Deut. xviii. 3-5). The amount to be given as F.-F. was not fixed by the Levitical law; in the Mishna the minimum was fixed at one-sixtieth.

In the Christian Church the practice of dedicating F.-F. to God for the support of his servants was observed from an early period. At first the fathers represented the practice merely as becoming and expedient; but as the notion grew that the clergy had succeeded to the position and privileges of the Levites, the Levitical law on this matter was represented as binding on Christians, for which conclusive proof was found in Mal. iii. Full details on the subject are given in the *Apostolic Canons* and *Constitutions*. A species of F.-F. was latterly exacted from the clergy themselves by the popes. (See ANNATES.) And in England, after the Reformation, the first year's profits of a benefice was made over to the Crown by statute 26 Hen. VIII. c. 3, and later on to the Church for the benefit of the holders of poor livings by statute 2 & 3 Anne c. 11. Smith's *Dict. of Christ. Antiquities*.

Firth or **Frith** (Dan. and Norw. *fjord*, Sw. *fjärd*), an arm of the sea or the estuary of a river—a word in common use in Scotland, as the Moray F., the Firths of Clyde, Forth, Tay, &c.

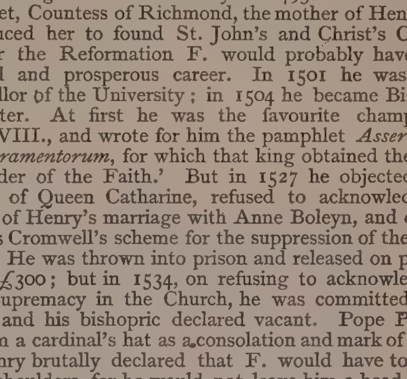
Fisc (Lat. *fiscus*, a 'money wicker-basket'), a name given to the treasure which belonged to the Roman Emperors. This was not the treasure, which belonged to the state, was vested in the senate, and was called *ærarium;* nor was it the *personal property* belonging to the Emperor. During the later empire the distinction disappeared and the imperial treasury embraced both *ærarium* and *fiscus*, and was known by either name. The F., according to the civil law, became in modern Europe the property of the state, and as it was yearly increased by *fines* paid by persons convicted of crime, such fines came to be called *confiscations*.

Fischart', Johann, a German satirist, was born at Mentz or Strasburg between 1545-50, studied law at Basel, visited England, lived as an advocate at Speier and as a bailiff at Forbach, where he died in 1589. F. was a man of considerable learning and great comic genius. He replied to the abusive attacks on Luther, which were common in his time, by fierce and telling satires and burlesques, full of rich, gross Aristophanic humour, and showing a marvellous command of language. Among his works are *Geschichtklitterung der Thaten der Helden Gargantua und Pantagruel* (1575), partly translated, partly imitated, from Rabelais; and *Psalmen und geistliche Lieder* (1576), which contain many fine sacred poems.

Fish, or **Fish-Plate,** a piece of wood or metal used in joining together the abutting ends of two members of a structure. The most familiar *fished joint* is that employed almost universally for connecting rails. Here the ends of the rails are made almost to touch, a F.-P. 15 to 18 inches long is placed upon each side of them, and the whole secured by two or three bolts through each rail. The importance of a sufficiently rigid rail-fastening is very great, not only on account of the increased comfort which it gives to travellers, owing to the smoothness of motion which it secures, but also because it greatly lessens the wear and tear of the rolling stock. Engineers have given much attention to the form and proportions of fish-plates and joints with the view of finding out the best possible arrangement, and many patents have been taken out in connection with them. Fished joints are used also for timber ties and beams, for strengthening spring spars, and many other purposes.

Fish'er, John, Bishop of Rochester, was born at Beverley in Yorkshire about 1459, and after a distinguished college career at Cambridge, became Master of Michael House College in that university in 1495. As confessor to Margaret, Countess of Richmond, the mother of Henry VII., he induced her to found St. John's and Christ's Colleges. But for the Reformation F. would probably have had a peaceful and prosperous career. In 1501 he was chosen Chancellor of the University; in 1504 he became Bishop of Rochester. At first he was the favourite champion of Henry VIII., and wrote for him the pamphlet *Assertio Septem Sacramentorum*, for which that king obtained the title of 'Defender of the Faith.' But in 1527 he objected to the divorce of Queen Catharine, refused to acknowledge the legality of Henry's marriage with Anne Boleyn, and opposed Thomas Cromwell's scheme for the suppression of the monasteries. He was thrown into prison and released on paying a fine of £300; but in 1534, on refusing to acknowledge the king's supremacy in the Church, he was committed to the Tower, and his bishopric declared vacant. Pope Paul III. sent him a cardinal's hat as a consolation and mark of respect, but Henry brutally declared that F. would have to wear it on his shoulders, for he would not leave him a head. After a short trial for treason, the old man was beheaded 22nd June, 1535. A biography of F., who was a writer of Scriptural commentaries, sermons, and controversial pamphlets, has been written by Lewis.

Fisher, The, a kind of marten, a member of the digitigrada (toe-walkers), mammalian order of the Carnivora, which occurs in N. America. From the tip of its tail to the end of its snout it measures about $3\frac{1}{2}$ feet. It somewhat resembles a fox in shape; its colour is black with grey points. It lives in trees, is nearly as agile as the squirrel, is extremely fierce and strong, and therefore difficult to catch. The origin of its name is uncertain, for it does not feed on fish but on hares, squirrels, mice, and birds.



Fisher.

Fish'eries. Under this term are generally included all the industries connected with procuring the creatures which inhabit either fresh or salt water, many of which have no connection with fish in their zoological relations. Thus the term includes the obtaining of such diverse animals and products as sponge, coral, pearl, shell-fish (including those valuable for their shells, as well as those sought for human food or as bait for other inhabitants of the sea), the crustaceans, as shrimps, crabs, and lobsters; and in the higher scale of animal life it is held to comprehend the capture of turtles, whales, seals, and their congeners. The only relation which these creatures bear to fish is the fact that they in common occupy the sea, and thus by F. are meant all animal products of the sea of whatever class. Here, however, will be noticed only the great industries for securing fish for human food from both salt and fresh water.

There is no way by which any approximately accurate estimate may be formed of the enormous value of the products annually drawn from the sea. Judging, however, by reliable statistics obtained for very limited areas, the wealth annually derived from the sea must be very great; and when the great extent of seaboard altogether neglected or only imperfectly fished is taken into account, there cannot be any doubt that F. are capable of indefinite expansion without crippling the productive resources of the sea. It is only in the case of a few minor creatures—noticeably the oyster, lobster and crab on British coasts—that overfishing, or rather indiscriminate and wasteful habits of fishing, has resulted in any decline of productiveness, such as to call for legislative interference.

Fresh-Water Fisheries.—The one fresh-water fish of paramount economic importance is the salmon, the F. of which in many Scottish rivers, particularly the Tay, are of very great value to their proprietors. While salmon fishing is the most prominent fresh-water industry, it is also highly esteemed for sport. It is prosecuted with draw nets, or in certain positions with stake nets; and by sportsmen the fish is taken with fly-hooks. The rivers of Northern Europe and America abound in salmon, and the produce of the American rivers now appears largely in commerce as 'tinned' salmon. The trout and other species of the salmon kind come next to the salmon in importance as fresh-water fish. After these may be reckoned the eel, pike, and perch; and in Russia, various species of sturgeon, obtained from the Volga and other rivers, are sources of valuable food delicacies, as well as of isinglass. It may here be stated that there is now a close season for all freshwater fish which has been provided under the Freshwater Fisheries Act of 1878 (United Kingdom).

Sea Fisheries are of much greater economic importance than fresh-water F. They are prosecuted in a variety of ways, the chief of which are:—(1) Trawling, (2) drift-net fishing, (3) line fishing, (4) sean fishing, (5) bag-net fishing, (6) kettle nets and weirs, and (7) trammel or set nets. (1) Trawling is performed with a triangular bag which has an arrangement for keeping its mouth open. The apparatus is called a trawl, and it is drawn along the bottom of the water. It is much employed by English fishers for catching haddocks, soles, turbots, plaice, and flat fish generally. (2) Drift nets are long nets having a definite size of mesh, and they are shot from boats and allowed to depend perpendicularly in the water, the upper side being kept at the surface by cork floats. They are used chiefly for the herring, pilchard, and mackerel fishing, the shoals of which, meeting these barriers in their course, attempt to push through them and so get entangled by their gills in the meshes of the nets. It is essential for the success of this style of fishing that it be conducted at night. (3) Line fishing is of two kinds—long-line fishing, in which many hooks are attached to a long central line, and baited for catching cod, ling, halibut, and haddocks; and short or hand line fishing, in which only a single hook is employed for the capture of cod. (4) The sean or sweep net is a long length of netting which is used for enclosing and sweeping a certain area of water in much the same way as in salmon fishing. It is employed for catching herrings, sprats, pilchard, mackerel, and various small fishes. (5) Bag nets are large open-mouthed bags like great trawls, used for sprat and whitebait catching, &c. (6) Kettle nets and weirs are structures placed along the coast between high and low water with the view of entrapping fish which may enter with the flowing tide, and which are secured when the water recedes. (7) Trammel nets are like drift nets in their action, but are fixed between stakes or other stays. The Cornish trammel consists of three nets set parallel to each other, the two outer having wide meshes, while that in the centre is fine in the mesh. The fish, passing through the outer net, pushes against the central net, forcing part of it through a mesh of the opposite outer net, thus forming a bag or pocket in which it is itself securely fastened.

Of all sea F. none equals in importance, extent, and value (except haddock) the herring fishery. It is most extensively cultivated along the N. and E. coasts of Scotland, the principal stations being Fraserburg, Peterhead, Wick, and Stornoway. The quantity of herrings taken annually on the Scottish coasts alone is prodigious, and there is good reason to conclude that the number taken by fishermen is but a fraction of what is destroyed by cod, dog-fish, sea-birds, and other natural enemies of the herring. Notwithstanding all these causes, there is not the slightest appearance of any decrease in the productiveness of the herring fishery, but quite the opposite. From returns which have been made by the Board of Trade it appears that of the 14,046,213 cwts. of fish returned as *landed* on the coasts of the United Kingdom during 1894, 5,869,312 were of herrings, 3,014,026 were of haddock, 104,737 were of soles, and 86,515 were of turbot; besides these, 29½ millions of oysters, 7¼ millions of crabs, and 1⅔ millions of lobsters were brought to shore. Haddock seem to have been the most valuable catch, as it is estimated at £1,503,978; herrings come next with £1,224,762; and soles, mackerel, and turbot, with £582,369, £478,148, and £313,080 respectively. One portion of the tables (1894) is very significant and it is that which points out the value of the fish landed in Ireland (£274,039) as compared with the value of that landed in England and Wales (£5,291,476) and in Scotland (£1,634,816). In 1893, it would appear, 6802 boats were registered and employed in England and Wales; 10,292 in Scotland, and 6515 in Ireland; and in the same year 42,694 men and boys were employed in the English and Welsh boats; 50,266 in the Scotch; and 27,829 in the Irish. On comparing the returns for 1889 and 1893, there is in 1893 a decrease of 683 in the number of English and Welsh boats; 647 in that of the Scotch, and an increase of 571 in that of the Irish; and there is a decrease of 779 in the number of men and boys employed in the English and Welsh boats; but, strange to say, there is an increase of 422 in the number employed in the Scotch boats. Of course, in the Irish boats we find more persons employed in 1893 than in 1889, viz., 3640, which is certainly a very encouraging circumstance as there is also an increase in the number of boats. We will now append a series of tables showing the quantity and value of the fish imported into and exported from the United Kingdom in 1894, and setting forth the comparative consumption of fish in this country during the years 1889 and 1894.

FISH IMPORTED INTO THE UNITED KINGDOM IN 1894.

Herrings, from	Cwts.	Value £.
Sweden	722,063	75,572
Norway	222,447	38,369
Other foreign countries	11,817	2,438
Total	956,327	116,379
Shell fish, from		
Norway	1906	4260
Holland	114,355	60,417
France	49,967	93,538
U.S. of America	156,632	107,441
Other foreign countries	1,502	2,155
Total from foreign countries	324,362	267,811
Total from British possessions (West Indies)	3456	11,148
Total	327,818	278,959

	Cwts.	Value £.
Other fresh fish, from		
Foreign countries (Sweden, Norway, Denmark, Germany, Holland, Belgium, France, Italy, U.S. of America)	241,084	381,888
British possessions	388	1,011
Total	241,472	382,899
Cured or salted,		
Sardines from foreign countries (France, Portugal, Spain, &c.)	104,165	339,762
British possessions (Madras, &c.)	951	2,066
Total	105,116	341,828
Other kinds from foreign countries (Sweden, Norway, Denmark, Germany, Holland, Belgium, France, Spain, Italy, U.S. of America, &c.)	577,711	763,688
Other kinds from British possessions (S. Africa, N. America, W. Indies, &c.)	347,533	763,327
Total	925,244	1,527,015

FISH EXPORTED FROM UNITED KINGDOM IN 1894.

Herrings, fresh and cured, to	Barrels.	Value £.
Foreign countries (Russia, Denmark, Germany, Holland, Belgium, Italy, Austria, Greece, Turkey, Egypt, U.S. of America, &c.)	1,377,213	1,444,786
British possessions (Malta, Australasia, &c.)	9,297	11,460
Total	1,386,510	1,456,246

Sardines, British cured, to	Cwts.	Value £.
Foreign countries	2	7
British possessions	27	76
Total	29	83

Salmon, to		
Foreign countries (France, Belgium, &c.)	2,952	18,601
British possessions	3	20
Total	2,955	18,621

Pilchards (*fresh and cured*), to	Hhds.	Value £.
Foreign countries (Italy, U.S. of America)	19,971	54,543
Channel Islands	441	1,800
Total	20,412	56,343

Other kinds, to	
Foreign countries	428,737
British possessions	93,149
Total	521,886

In the return issued by the Board of Trade and dated 15th February, 1895, we find the following tables:—

Total imported fish (1890) £2,811,455; (1894) £2,647,091.
Total exported fish (1890) £1,795,267; (1894) £2,054,047.

Herrings (1890), £1,284,946; (1894) £1,459,569.

	1889	1894
Fish, the produce of the United Kingdom fisheries (not salmon)	£6,020,000	£7,200,331
Fish, imported from abroad and retained for consumption	£2,112,000	£2,171,000
Total	£8,132,000	£9,371,331
Deduct.—Fish, exported produce of the United Kingdom fisheries	£1,767,000	£2,054,000
Total value of fish consumed in the United Kingdom	£6,365,000	£7,317,331

We also find set forth in the returns the annual value of the sea fisheries of certain countries, which we may compare with that of our own: Norway (1893) £1,312,000; France (1893) £4,582,000; Canada (1893) £4,310,000, of which Nova Scotia is credited with £1,335,000; United Kingdom (1894), £7,200,331. In the same report are stated the values of fish landed during each month in the years 1892, 1893, and 1894. It would appear that November and April were the most remunerative periods in 1892, and February the least; in September and October, 1893, the most valuable catches of fish were landed, and in January the poorest; and May and November, in 1894, turned out to be the best fishing months, and February the worst. We may therefore conclude from this that fishing in January and February is the least paying to those concerned in the actual catching of the fish, though very probably the salesmen make more money during those months than at any other time of the year.

Fisheries Exhibitions, in which all articles relating to fish and fisheries are exhibited, were originated at Norwich, England, in 1880; followed by one in Edinburgh in 1881, and by a great international one held in London in 1883, to which the United States and other countries contributed funds and exhibits. All were eminently successful.

Fishery, Free, is in England an exclusive right of fishing in a public stream. It is a royal franchise, and must be at least as old as the reign of Henry II., to grant the right being expressly prohibited by Magna Charta.

Fish'es, the lowest group of Vertebrate animals, are adapted for locomotion in water by being provided with gills for breathing, during the whole of life; by the heart consisting of an auricle and a ventricle; by possessing cold blood, which is carried in an arterial condition from the gills to the body; by the body being usually covered with scales; by the limbs being developed in the form of fins; and by the embryo possessing neither an Amnion nor an Allantois. The *form* of F. is that best adapted for easy locomotion in water. In the great majority of cases the body is pointed at each end, and flattened somewhat from side to side, whilst it is also rounded on the sides. In some F. it is apparently flattened above and below—as in the flounder, plaice, and other 'flat-F.' But in these cases, the body is greatly flattened *from side to side*, the two eyes being, through a peculiarity in development, brought round to one side of the head. The skates, rays, &c., are more truly *flat-F.* than the flounders, &c., since their dorsal or back surface really appears to be flattened, owing chiefly to the great enlargement of the pectoral or breast fins. The bodies of most F. are scaly. In some cases (such as the eels), where scales are either very small or altogether wanting, the body is generally covered with a *mucous* secretion, serving to protect it from the action of the water. The scales of F. may be *cycloid*, as in herrings, salmon, &c.; *placoid*, as in skates and sharks; *ctenoid*, as in perches, &c.; or *ganoid*, as in the sturgeons, bony pikes, &c. This last form of scale is most common in Fossil F. Along the sides of most F. a line named the *lateral line* may be perceived. This line was formerly believed to be connected with the production of the mucous secretion which protected the body or scales, but it is now ascertained to be connected with the exercise of the sense of *touch*, since the terminations of nerves have been traced to a connection with this line; and the acts of many F. in rubbing the sides of their bodies against foreign objects seem to lend support to this latter belief. The *endoskeleton* of F. may be of very varied nature. Thus in the lowest fish of all, the *Amphioxus* or lancelet, there is no skeleton to speak of, this structure being represented by a soft cellular rod, the *Notochord* (q.v.), or *chordo dorsalis*, which represents the immature and imperfectly-developed spine. In other F., such as sharks, skates, rays, the skeleton is imperfectly ossified, and is composed of *cartilage;* whilst in the great majority, including the familiar food-F., it is of bony nature. The spine of F. (save in one instance, that of the bony pike or *Lepidosteus*) is composed of vertebræ, hollow at either end, and hence named *amphicœlous*. When two vertebræ are opposed, a cavity is formed by the opposition of the vertebral bodies; and this cavity forms a kind of universal joint, permitting the freest possible motion and movement of the spine in swimming. In the bony pike the vertebræ are *opisthocœlous*, that is, hollow behind and convex in front. The spine exhibits a division into two regions only—an *abdominal* and a *caudal* region, no distinct cervical, dorsal, or lumbar portions being recognisable. The vertebræ of the abdomen possess an upper or neural canal, neural spines, and two transverse processes, to which latter the ribs are attached. The caudal or tail vertebræ have an inferior or hæmal arch, but no distinct transverse processes. The ribs are not attached below to a sternum or breastbone, but simply embedded in the muscles. The *interspinous bones* of F. are dagger-shaped bones which exist in the middle line of the body, and are attached below to the spines of the vertebræ; above they support the rays of the dorsal and hind fins. The *fins* of F. may be divided into two groups. The *pectoral* and *ventral* fins are paired, and represent the fore and hind limbs of other vertebrates respectively. The other fins are single or median, and are placed in the middle line of the body. Those on the back are the *dorsal* fins; the hind fin is placed near the *vent* in the lower aspect of the body, and the *caudal* or *tail-fin* is the chief agent in locomotion. The fins are supported by bony rays or spines, and by soft rays. The *caudal* fin of F. is always set vertically, and works from side to side, the tail-fin of the whales and Sirenia amongst mammals being placed horizontally. The *digestive system* of F. comprehends a mouth, usually provided with numerous teeth, which are replaced when lost or injured, and which are not set in sockets, but attached by a ligament to the bones of the mouth. The stomach is large, and provided at its hinder extremity with a number of blind sacs or appendages, varying from one to sixty or more in number, named *pyloric cœca*, which are supposed to represent *pancreas* or sweetbread. The intestine is shut as a rule, and is often provided with a spiral coil, serving to increase its digestive area. The liver is usually large and oily. The *kidneys* are also large. The blood of F. is cold, and contains nucleated blood corpuscles. It is of red colour in all save the lancelet. The heart is two-chambered, and consists of an *auricle*, which receives the venous blood from the body, and of a *ventricle* which propels it to the *gills* or *branchiæ* for purification. In many F. a third chamber of the heart is formed by the dilatation of the great blood vessels of the gills, this dilatation being named the *bulbus arteriosus*. In some F. (*e.g.*, sharks, &c.) this latter structure contracts in a rhythmical manner. The *gills* or breathing organs of F. consist of comb-like structures borne on branchial or gill arches, and composed of delicate filaments in which the blood is exposed to the aërating influences of the external water. In the sharks, rays, &c., the gills exist in the form of pouch-like cavities. The water for aëration is admitted by the mouth, and after passing over the gills and yielding up its oxygen, is ejected from the gill-chambers at the sides of the mouth, behind the *operculum* or gill-cover, or in the sharks, &c., by special apertures. The *air* or *swimming bladder* of F. (see AIR-BLADDER), or *sound*, as it is also called, is used for altering the specific gravity of these animals, and thus enabling them to rise or sink in the water. The *nervous system*, comprising a brain, spinal cord, and nerves, is distinct in all F. save the Lancelet (q.v.). The senses comprise large eyes, internal *ears*, touch (performed by the lateral line), and smell. The nostrils of all F., except the hag-F. (*Myxine*) and the *Lepidosirens* or mud-F., are simple closed or pocket-like sacs. F. are *oviparous* animals, producing eggs from ovaries, the young being afterwards hatched. But in some cases (skate, dog-F., &c.) the eggs may be enclosed in special cases or capsules, and in sharks there would appear to be an intimate connection between the parent and young, reminding one of the *placental* connection of *Mammalia*. As in all *Vertebrata*, the sexes are distinct. The *habits* of F. differ very widely. Migration is not uncommon with many, although the nature of the migratory movements is less susceptible of determination than in the case of land animals. An idea of the *classification of F.*, according to modern zoology, may be formed from the following table:—

Order.	Example.
1. *Pharyngobranchii* (pharynx-breathers).	The amphioxus or lancelet.
2. *Marsipobranchii* (pouch-gilled breathers).	Lampreys and hag-F.
3. *Teleostei* (F. with bony skeletons).	Cod, salmon, herrings, and all familiar F.
4. *Elasmobranchii* (plate-gilled breathers).	Sharks, rays, dog-F., &c.
5. *Ganoidei* (F. with ganoid scales).	Sturgeon, bony-pike, &c., and many fossil F.
6. *Dipnoi* (F. breathing by gills and rudimentary lungs).	Lepidosirens or mud-F.

(By the majority of naturalists the *Dipnoi* are classified as a sub-division of the *Ganoidei*, this arrangement reducing the orders of F. to five in number.)

Fossil F.—The first traces of F. which appear in the rock formations occur in the Upper Silurian strata, these traces, consisting of the fin-spines and placoid scales, belonging to F. most nearly allied to the *Elasmobranchii*. In the Devonian or Old Red Sandstone rocks, fish remains are so plentiful that this epoch has been named the 'Age of F.' The Devonian fossil F. belong chiefly to the Ganoid order. The Teleostean or true bony F. do not make their appearance until the Cretaceous epoch at the close of the Mesozoic period; and three groups of F. (*Marsipobranchii*, *Pharyngobranchii*, and *Dipnoi*) have, as far as is yet known, left no traces of their existence in any rock formation.

Law Regarding F.—They become the property of him who catches them except royal fish. (See FISHES, ROYAL.) Though it requires a royal grant to entitle a man to fish for salmon, yet the salmon when taken by a man who has no grant belong to himself. Statute 24 & 25 Vict. c. 96 imposes penalties on persons taking fish without permission from water which is private property. Persons found angling against the provisions of the Act, which does not extend to Scotland, may be required by the owner or his servant to deliver up their fishing implements. On refusal these may be forcibly seized. But if the implements are taken, there is no further penalty or damage. To destroy the dam of any fish-pond which is private property, with intent to destroy the fish, or to put lime or other noxious material into it with the same intent, is a misdemeanour and renders the offender liable to penal servitude for 3-7 years, or to imprisonment for 2 years, &c.

Fishes, Royal, are those which by common law belong to the Crown, being the whale and the sturgeon when thrown ashore or caught near the coast. The law is a little obscure, however, and is modified or altered by local custom.

Fish Hawk, a genus of the *Falconidæ*, has a short bill with a sharp hooked tip, short strong tarsi, long toes, and wings extending to the tail. It is heavier than the eagle and much slower on the wing, and occurs in temperate regions. The head and under parts are white; the upper parts being of amber brown, and the bill and claws of a blackish blue. It is gregarious and, though sometimes found at a great distance from the land, usually frequents lakes, rivers, and estuaries near the sea. No bird exhibits a greater dexterity in catching fish, which is its chief food, and with such velocity does it pounce upon its prey that it often becomes totally submerged and is sometimes drowned owing to the superior weight of the fish in which its claws and beak have become embedded.

The eggs, of a whitish yellow spotted with brown, are three or four in number. Its nature would appear to be timid, and more gentle than that of the other Falconidæ.

American Fish-Hawk.

Fish-Hooks are made by a series of hand processes. The steel wire is first cut into lengths, and then slit with a lever knife near one end to form the barb. Each length, after being filed round the point and barb, is bent to the hook form by means of an instrument with a suitable core and pin. The end of the shank is then hammered flat to enable the hook to be secured to the line. The hook is next hardened, made stiff and elastic by tempering, and finished by blueing. F.-H. are sometimes swivelled at the head to prevent the twisting of the line. Redditch, in Worcestershire, is the great place for the manufacture of F.-H., though Limerick, at one time, was notable for its F.-H. In the former place so many as four millions are said to be made every week. In the United States they are made extensively by Crosby's automatic machine, which, it is said, is capable of turning out 6000 highly-finished F.-H. every hour.

Fish'ing-Tac'kle. See ANGLING.

Fish-Lice, or **Sea-Lice,** a name given to several genera and species of lower Crustaceans, from their parasitic habits. They attach themselves to the skin, gills, and other parts of fishes and other aquatic animals. One of the best-known forms is *Cymothöe æstrum*, which adheres to fishes by means of its hooked legs and suctorial mouth. Other genera are *Achtheres*, of which *A. percarum* of the perch is a good example; *Argulus*, of which *A. foliaceus*, common on fresh-water fishes, is a familiar species; and *Caligulus*, species of which are common on marine fishes. These fish-lice belong to the Crustacean orders *Rhizocephala* and *Ichthyophthira*. In their development they pass through a metamorphosis, appearing at first as lively free-swimming bodies, but eventually losing their limbs, &c., settle down to a parasitic life.

Fish'ponds. See PISCICULTURE.

Fish-Skin Disease, or **Ichthyo'sis Ve'ra,** is a disease of the epidermis characterized by a general dryness and roughness of the skin, modified in appearance in different regions of the body. The defective nutrition of the texture of the skin is most apparent in the limbs, particularly the arms, and there is a marked deficiency of subcutaneous adipose tissue. When the skin is hard, it may be moved about on the subcutaneous fascia as if there were no binding tissue between the under surface of the corium and the structures beneath; and it remains stiff like leather, apparently depending upon the lines of motion for its power of adaptation to the movements of the joints. The skin of the face may be perfectly normal, while that of the hands and arms may be dry and wrinkled, like the withered limbs of old age. Treatment:—General hygienic measures, nutritive diet with cod-liver oil; arseniate of soda, or Fowler's solution; Donovan's solution; locally, frictions and inunctions, bathing, &c. The disease is of a very obstinate nature, and its cure is difficult and seldom complete. See *Diseases of the Skin* by Erasmus Wilson, T. Macall Anderson, and by Tilbury Fox.

Fissip'arous, a term used to describe reproduction by a process of division. It is well seen in the reproduction of many of the lower forms of animal and plant life, and it also probably takes place in the human body in the formation of colourless blood cells, pus corpuscles, modified epidermic cells, &c.

Fissiros'tres (Lat. 'split-beaked'), a sub-order of the order *Insessores* (q.v.) or Perching birds, distinguished by the so-called 'cleft' nature of the beak; the 'gape' or mouth-opening being very wide, prolonged far back on the head, and pointed with bristles, of service to these birds in the capture of insect prey. The beak itself is short. Typical examples are the swallows, the swifts, and the goat-suckers.

Fissurell'idæ, a family of Gasteropodous Molluscs including the forms popularly known as 'keyhole limpets.' The shells of these forms have an opening at the apex, which has suggested the popular name. The family belongs to the Holostomatous group of the Prosobranchiate Gasteropods. The shell is conical, and its aperture is subservient to the respiration or breathing of these forms. *Fissurella maxima* is a familiar species, and the family also includes the genera *Emarginula* and *Parmophorus*.

Fis'tula (Lat. 'a pipe'), or **Sin'us** (Lat. 'a winding'), a narrow passage, the walls of which are always indurated, consisting of a layer of imperfectly-formed granulations discharging ichorous pus. The passage, which is often long and winding, has an external orifice somewhat protuberant, situated under or in the midst of granulations. F. is, therefore, a chronic abscess without disposition to close. The causes of this non-closure may be—(1) the presence of some foreign body, such as a piece of dead bone; (2) the passage of irritating secretions; and (3) the contraction of neighbouring muscles preventing the coalescence of the sides of the abscess. The treatment of F. must have reference to its cause, and the foreign body or irritating substance must be removed. In recent cases a cure may be effected by pressure; or a healthy inflammation may be excited by injecting the F. with tincture of iodine; by means of a seton; by actual cautery, or by galvanic cautery. The treatment of F. should always be intrusted to a skilful surgeon, and in such a case a complete cure may be effected in even the most distressing cases.

Fistular'idæ, a group of Teleostean fishes, which from the prolongation of the jaws have been named 'pipe fishes,' 'tobacco-pipe fishes,' 'bellows fishes,' and the like. The genera *Centriscus* and *Fistularia* are illustrative of this group, which is distinguished by the elongated body, by the tube-like jaws and small mouth, by the scaly body, and by the ventral fins being placed on the abdomen and possessing six spines. The true pipe-fishes or *Syngnathidæ* belong to a different group, that of the *Lophobranchii*.

Fistuli'na, a genus of fungi related to Boletus (q.v.), and represented by the British species *F. hepatica*, found growing on oaks, beeches, chestnuts, and walnut trees. The specific name *hepatica* is derived from the appearance of these fungi when old; the surface becoming brown, and not unlike the liver in outward aspect. The colour is red, and the fungus may attain a size of 5 feet in circumference, and a weight of 7 or 8 lbs. Berkeley gives an instance of one which weighed 30 lbs. The F. is an esculent, and is eaten on the Continent.

Fitch'y, or **Fitché,** in heraldry, pointed at the end; *e.g., a cross fitchée* is a cross with one end sharply pointed.

Fits, a term popularly applied to any sudden seizure of disease, more particularly to those implying loss of consciousness or a change in the condition of the mind, such as apoplexy, convulsions, epilepsy, &c.

Fitz (Fr. *fils*, Old Fr. *fiz*, from Lat. *filius*, 'a son'), a prefix denoting at first merely descent, and afterwards applied to illegitimate sons of kings and princes of the blood—as *Fitzroy*, 'son of the king.'

Fitz-Gerald, Edward, Lord, a younger son of the Duke of Leinster. He lived in France from 1773 to 1779, then joined the British army, and distinguished himself at the battle of Charleston, S. Carolina (1781). Returning to Ireland in 1784 he was elected to the Irish parliament and became a determined opponent of the government. In 1788 he served again in the army in America, and in 1791 went over to Paris to consult with the republicans. There he married Pamela, the supposed daughter of Madame de Genlis, and governess to the family of the Duke of Orleans; one of her pupils being Louis Philippe. In 1796 F. joined the *United Irishmen* and took a prominent part in arranging for the insurrection of 1798. The plot was divulged before the time of the rising became due, and on certain officers attempting to arrest F., the latter resisted desperately, was wounded, and died in prison in 1798.

Fitz'roy, a name of frequent occurrence in Australian topography, and derived from Sir Charles A. Fitzroy, who was governor of New South Wales from 1846 to 1855, and under whom the colony received the boon of responsible government. After him are named the following:—1. A city in Victoria, forming a suburb of Melbourne, but under distinct municipal government, and inhabited chiefly by the more well-to-do citizens. Pop. 32,453. 2. A county of New South Wales in the Clarence (N.E.) district. Pop. 2447. 3. A river in Queensland, which rises in the Peak Range, and after a tortuous course of 300 miles, falls into the S. Pacific at Port Curtis, in 23° 30′ S. lat., 151° 50′ E. long. The important town of Rockhampton (q.v.) is situated on the F., 35 miles from its mouth.

Fitz-roy, Robert, Vice-Admiral, an eminent English navigator and meteorologist, a son of General Lord Charles Fitz-roy, was born in 1805, entered the Royal Navy in 1819, and was captain of H.M.S. *Beagle* on its voyage around the world in 1831-36, in which expedition Charles Darwin took part. An account of the survey appeared in *Narrative of the Surveying Voyages of H.M.S. 'Adventure' and 'Beagle' between* 1826 *and* 1836, *&c.* (1839). From 1841 to 1843 he represented Durham, and from 1843 to 1846 served as governor of New Zealand. In 1855 he was appointed chief of the meteorological department of the Board of Trade, and died in 1865. F.'s method of storm-warnings was the commencement of a system which has become most valuable in saving life and property.

Fitz-Stephen, William, an eminent English monk and historian of the 12th c. He witnessed the assassination of Thomas à Becket, of whom he was an intimate friend. His most important work is the *Description of the City of London*, which is one of the earliest and most valuable descriptions of the capital. This was however, simply an introduction to his *Life and Passion of Archbishop Becket*. Both were written in Latin. He died about 1191.

Fi'ume ('the river,' formerly *St. Veit am Flaum*, from the Lat. *Fanum St. Viti ad flumen*; Illyrian *Reka*), a Hungarian town of Austria-Hungary, 40 miles S.E. of Trieste. It stands on the Adriatic, in a narrow and wild pass, where the Fiumara falls into the Adriatic. Rocky heights, on one of which is the old castle of Fersata, rise behind it, and before it the Channel of Quarnero is studded with green islands. The old town, straggling and gloomy, overhangs the new town, which has many handsome, spacious, and colonnaded streets. Among the finest buildings are the cathedral of St. Veit, the nunnery, gymnasium, and hospital. Near F. is a church much frequented by pilgrims. F. has manufactures of linen, wool, leather, paper, tobacco, earthenware, sugar, wax, rope, &c., and considerable shipbuilding. The harbour has been much improved, and is now one of the best in the Mediterranean; the trade is in a very flourishing condition and there is a considerable export of wine, flour, and barrel staves; the last-named are of a peculiar sort of oak wood which grows in the neighbourhood and may be split like slate. Area 8 sq. miles; pop. 30,337.

Five-Forks, a district in Dinwiddie county, Virginia, where the Federals, under General Sheridan, won a decisive victory over the Confederates, 1st April, 1865.

Five Points is a name given to the five articles of doctrine which the Arminians presented to the States of Holland (1611), as embodying their views on predestination and grace, on which alone at that time they differed from Calvinists. See ARMINIUS.

Fives, a game played by striking a ball with the hand against a high wall, so named because the number of points, fifteen or twenty-five, necessary to score a win is a multiple of five. The 'bounds' of the game are marked by one chalk line on the wall, a yard from the ground, and a second on the ground 10 feet from the wall. The players of each side engage the ball alternately, striking it either as it rebounds from the wall, or as it springs up from the ground. Missing the ball or striking it so that it falls within the 'bounds' counts one point for the opposing side. F. is an ancient game, and in England was formerly called 'hand tennis.' In 'bat-F.' the ball is struck with a bat in place of with the hand. This is a favourite game at many of our great public schools, and at Westminster School in particular, where the boys have for years sustained a high reputation as skilful players.

Fixed Air was the name given by Black, its discoverer, to carbonic acid gas. He so named it in consequence of the power possessed by certain substances (potash, lime, magnesia, &c.) of absorbing or *fixing* it.

Fixed Bodies are those which cannot be volatilised, nor which suffer change when they are exposed to a high temperature.

Fixed Oils are such as do not evaporate at ordinary temperatures, for example, the oils of olive, linseed, and rapeseed.

Fixed Stars. See STARS.

Fix'ing, the term applied in photography to the operation following development, and immediately preceding the exposure of the picture to diffused light. It consisted in depriving the picture of the salts surrounding the image, which were still sensitive to light, by means of hyposulphite of soda or cyanide of potassium solution.

Fix'tures. Whatever is fixed or united by means of rails, cement, &c., to the soil or outhouse or farmyard wall so as to become a part of it, will at the expiration of a lease belong to the lessor, but a tenant may remove anything which he has placed, and has not fixed, for the convenience of his trade, such as engines, counters, &c., provided he does it during his term, and has not made an agreement to the contrary. Under the Agricultural Holdings Act of 1883, the tenant obtains a property in any fencing, engine, machinery, building, &c., as to which he can get no compensation, provided he remove the fencing, &c., before, or reasonably soon after, the end of his tenancy. The landlord has the option of purchase. Also things placed as ornament and convenience may be removed by the tenant on quitting, such as, beds fastened to the walls or ceiling, cupboards fixed with holdfasts, grates, stoves, pier-glasses, window-blinds, fixed coppers, furnaces, and tables, wainscoting screwed to the walls, &c., provided he remove them during his tenancy.

Flabellum, a large fan of circular shape and made of peacock's feathers, which was used as a brush in Roman houses and in Eastern churches. Until the 14th c. it still formed part of the furniture of the Latin churches, and to this day is retained in certain ceremonies at which the Pope officiates.

Flacc'us, C. Valerius, a native of Padua, who is supposed to have died about A.D. 88, is now known only as the author of an unfinished epic poem in eight books on the Argonautic expedition. 'F. has attained to somewhat of the outward form, but to nothing of the inward spirit, of his great model the Æneid.' The *Argonautica* was translated into English verse by Nicholas Whyte (1565).

Flabellum.

Flag (lit. 'that which flies or flutters,' from Old Eng. *fleogan*, 'to fly'), a light cloth worked in a specific shape or pattern, and displayed in the field or on board ship as an emblem or signal. Under this designation are included the royal standard, the colours of regiments, and all ensigns, banners, and the signals used in the army for marking off ground to be occupied by troops, and in the navy for the transmission of messages from ship to ship. The great flag of Britain is the royal standard, bearing the arms of the United Kingdom, and hoisted only in the presence of the sovereign or a member of the royal family; the next is that of the Lord High Admiral—an anchor on a red field; and the third in importance is the Union Jack (q.v.), the national flag of Great Britain. The British ensign is a red F. with the Union Jack borne as a *canton*, or occupying the upper corner next the flagstaff. In the British navy the centre squadron, commanded by the admiral, carried red ensigns at the *main*; the van-squadron, commanded by the vice-admiral, carried white ensigns at the *fore*; and the rear squadron, commanded by the rear-admiral, carried blue ensigns at the *mizen* or sternmost mast. The broad pennant was the special flag of an admiral, but every man-of-war carried a pennant, the colour of which defined the squadron to which the ship belongs. In 1864 the use of distinguishing colours was abolished, and every man-of-war in commission in the royal navy is now required to carry a white ensign with a red St. George's cross, and the Union Jack in the upper canton. An admiral carries his flag at the main top-gallant mast-head, a vice-admiral at the fore top-gallant mast-head, and a rear-admiral at the mizen top-gallant mast-head. Ships belonging to any public office or in command of an officer of the Royal Naval Reserve carry the blue ensign and Union Jack; and other British ships, which have no right to any particular flag, carry the red ensign and Union Jack. By means of flags of easily-distinguished shape and colour, each of them representing letters or numbers signifying words or sentences, and to which there is an official key, vessels can communicate with freedom, certainty, and rapidity. Nelson's famous message at Trafalgar was communicated by means of F. signals, and so rapidly, that, in recognition of it, all the ships of the fleet were manned simultaneously. In 1855 a new system of signalling for the merchant service was adopted by a specially-appointed committee, by means of which, using eighteen flags and three pennants, 78,642 signals can be made, each consisting of not more than four flags at a hoist.

Flag-Captain, the captain who sails in the flag-ship—*i.e.*, the admiral's ship in any squadron—and who relieves the admiral of many of the ordinary duties of command.

Fla'gellants (Lat. *flagellantes*, 'the scourgers'), the name given to those mediæval fanatics who believed in the possibility of expiating sin by self-inflicted castigation. This practice was not a very early one in the Christian Church, flagellation being used at first solely as a punishment. About the 11th c., however, it began to be employed as a substitute for pecuniary penance, a year of penance being commuted into the payment of 26 silver *solidi* (£4) or the infliction of 3000 lashes. It is told of one famous hermit, St. Dominic of the Iron Cuirass, that he inflicted on himself in six days so many stripes that he discharged a century of penance (Fleury's *Eccles. Hist.*, vol. xiii.). Numerous penitents of both sexes adopted this mode of self-torment, and it is said to have been a special favourite among ladies of quality (Chais's *Lettres sur les Indulgences*, vol. ii.). The practice continued down to the end of the 13th c. as one of the ordinary forms of penitential observance, but at that period there broke out in Italy an endemic of superstition, due to a belief in the approaching end of the world, which took the shape of flagellantism, and rapidly spread all over Europe. The F. became a regular society; they marched with naked shoulders through the streets of the towns, each one holding a scourge of leathern thongs, with which he lashed his back till the blood ran. Men, women, and even children of tender years joined in these processions, and all classes were represented. Sometimes the throng was led by a priest; banners, crucifixes, and at night lighted tapers, were borne before them. At times they would stretch themselves on the earth in the form of a cross, and in this attitude undergo the severest discipline at each other's hands. The chief 13th c. outbreak of this fanaticism began at Perugia in 1260, and though promptly suppressed in Italy, showed itself in various districts of France and Austria. The F. next became prominent in the middle of the 14th c., when the dreaded plague called the Black Death evoked a universal religious frenzy. This outbreak was both wider spread and more extravagant than the former. It reached as far as England, appearing in London. A band numbering 120 exhibited their self-imposed tortures in the streets of the city, but do not appear to have succeeded in making any converts (Lingard's *Hist. of Eng.*, vol. iii.). The Church, however, was at this period forced to interfere, flagellantism having been elevated by its votaries into the position of a sacrament, as a 'baptism of blood.' Clement VII. anathematized the F.; but they were not suppressed until their frequently impure excesses had overrun Germany, the Low Countries, Sweden, and Switzerland (Baluze's *Vitæ Pontif. Avenion.*, vol. i.). The third and final outbreak of the mania took place in 1414 in Thuringia and Lower Saxony. Flagellantism here assumed its wildest phase, and became distinctly heretical, rejecting all practical religion, the sacraments, purgatory, prayer for the dead, &c. Salvation was to be secured by the scourge, and that alone. The leader of these fanatics was one Konrad Schmidt of Sangerhausen, who was burned in 1414 by Schönefeld the Inquisitor, along with many of his followers. Schmidt's 'Fifty Articles of the F.' were condemned by the Council of Constance (Von der Hardt's *Acta Concilii Constant.*, vol. i.), and the heresy was thus stamped out. Flagellantism, as an excess of religious revival, did not again appear; but the Romish Church to this day sanctions a discipline of self-castigation. See Mosheim's *Church History*, Hallam's *Middle Ages*, *Mysticism and the Mystics*, and Cooper's *Flagellation and the F.*

Flage'olet, an instrument with a mouthpiece like a whistle, and fingered like a flute. It is easy to play, and the quality of its tones is pleasant, but it does not possess sufficient individuality or richness to give it a place among orchestral instruments. The Harmonics (q.v.) of the violin and other stringed instruments have sometimes been called, very clumsily, F. tones.

Flag'-Lieutenant, the officer in a flag-ship who communicates the admiral's orders, either personally or by signal, to the ships in command, and performs generally such duties as an aide-de-camp is entrusted with in relation to a general.

Flag'-Officer, in the navy, is one who has the right to carry a flag at his mast-head denoting his rank—a privilege confined to admirals, vice-admirals, rear-admirals, and commodores, or captains in command.

Flag of the Prophet, the sacred flag (*Sanjak-Sherif*) of the Moslem, and the most highly-prized of the Mohammedan relics, is a black banner formed of the curtain that hung in front of the door of Ayesha, one of Mohammed's wives; was obtained by the followers of Omar at Damascus; and is preserved in a casket in the Seraglio, where it is guarded by emirs. It is never unfurled.

Flag'-Ship, the ship in which the admiral sails, and which carries the flag. From this ship, usually the largest in the squadron, orders are signalled to the other vessels.

Flag'stones are rocks of calcareous or argillaceous sandstones and limestones, which split easily into large flat slabs useful for paving. Those of Yorkshire and Caithness are well known for their hardness and durability.

Flahau'lt de la Billarderie, Auguste Charles Joseph, Comte de, a French soldier and diplomatist, was born at Paris, 21st April, 1785, became aide-de-camp to

Napoleon, distinguished himself in the Peninsular war and at Leipzig, was made a general and count, and fought at Waterloo. In 1817 he married a Scottish heiress, Margaret M. Elphinstone, who afterwards succeeded to the baronies of Keith and Nairn and became the Baroness Keith. In 1830 he recovered his position in the French army. He was ambassador at Vienna from 1841 to 1848, and at London in 1860. He was made Grand Chancellor of the Legion of Honour in 1864, and died at Paris, 2nd September, 1870.

Flam'borough Head (Old Eng. *Fleamburh*, so named probably from its *flame* or beacon), a headland on the Yorkshire coast, on the N.E. boundary of Bridlington Bay. It is formed by a line of chalk cliffs, rising to 450 feet, and runs for 6 miles into the sea. It has a lighthouse 214 feet high, and is crossed by an old British work known as Danes' Dyke.

Flamboy'ant, the latest and feeblest style of Gothic architecture in France. It is named from the flame-like forms of its characteristic traceries—intricate reticulations of delicate gauzy texture, woven of thin, wavy lines into meshes of every diversity of size. There is good and bad F., the latter being that in which ornament is allowed to impair construction. Even good F. is Gothic without magnificence or serenity, and its restless caprice is only redeemed by endless variety and floral grace. Ruskin says, 'The F. leaf-mouldings are beautiful, because they nestle and run up the hollows, and fill the angles, and clasp the shafts' in the manner of natural leaves. A feature of the style is the twining of twigs and stalks into pillars. When mouldings meet, they are apparently interlaced or run through each other. While the windows and doors are generally large and richly carved, the wall surfaces are comparatively bare. A mark of the most debased F. is the figure of the *fleur-de-lis* in tracery bars. F., which prevailed in the 15th and 16th centuries, is well represented in the cathedral of Chartres, the pediment of the west front of Rouen, the lantern of St. Ouen (Rouen), the central tower of Bayeux, and the buttresses of St. Gervais at Falaise.

Flame (Lat. *flamma*) is the luminous appearance accompanying the gradual combustion of inflammable substances in the air. Combustion is really an evolution of heat produced by a transformation of the energy of chemical affinity existing between the combustible and oxygen; and if the heat produced be sufficiently intense, part of it will take the higher form of light. The luminosity of a F. is generally supposed to depend upon the presence of solid particles, probably carbon, which glow under the action of the intense heat; and this theory is supported by the continuous spectrum which luminous flames give. In the common gas F. the presence of such particles is little doubtful. This is readily shown by the deposition of soot upon a cold body held in the F. It is now known, however, that gases under pressure give out a continuous spectrum; and experiments of Dr. Frankland have indicated that luminosity does not necessarily depend upon the presence of solid particles. Much of the luminosity of our ordinary flames is due to imperfect combustion; and if by any means a gas jet is diminished in light-giving power, it is increased in its heating capacity. This is well exemplified by Bunsen's burner—a simple contrivance of incalculable value in the laboratory. Its construction is such that the stream of gas issuing from the jet is first made to traverse a tube of comparatively wide bore, which is perforated at its lower extremity with holes for the admission of air. The gas is thus thoroughly mixed with air before it is lighted, and a continuous draught is produced, so that the combustion is rendered perfect. The Bunsen F. is of a transparent blue colour, and in its interior is a hollow cone containing a mixture of air and gas which is not sufficiently raised in temperature to permit of combustion. The hottest part of the F. is just above this cool cone. For combustion a certain temperature is necessary—the principle upon which Davy constructed his Safety-Lamp (q.v.), whose wire-gauze covering reduces the outside atmosphere to a temperature too low for the combustion.

Flam'en, a Roman priest, so named from the band (*filum, filamen, flamen*) of white wool which he wore round his head. These priests were fifteen in number, and their services were appropriated to a particular deity, from whom they derived a special name. The three principal flamens, known as the *Majores*, were the *F. Dialis*, *F. Martialis*, and *F. Quirinalis*—the priests respectively of Jupiter, Mars, and Quirinus—and were chosen always from the patricians, while the others—the *Minores*—might be plebeians. The special dress of the F. was the apex (a cap), the læna (a cloak), and a wreath of laurel. The *F. Dialis* was the most distinguished of the flamens, and enjoyed many privileges; as, for example, he had a right to a lictor, to the curule chair, and to a seat in the senate. His wife was called *Flaminica*, and on her death the *F. Dialis* was bound to resign.

Flamin'go, a genus of birds usually included in the order *Grallatores* or Waders, to which it is allied by length of limb; but many ornithologists regard it as more appropriately ranked with Natatorial or Swimming birds, from the webbed feet. The three front toes are fully united by a web, and the bill is broad and lamellate, resembling that of the Lamellirostral *Natatores*. The bill is also of singular form, being bent abruptly downwards from the middle. The toes themselves are short, and the nostrils are placed in a groove and covered with membrane. The first and second quills are the longest of the wings. The tail is short. The typical example of the F. is the common F. of S. Europe and other parts of the Old World. It inhabits the sea-coast and marshes, and is gregarious in its habits. A sentinel bird watches over the safety of the flock. When at rest, the F. lies on the ground with its legs doubled under it, and its neck curiously bent. The nest is made of mud and earth so as to form a small hillock. The eggs are white, and number two or three. The colour is scarlet when in full plumage, the quill feathers being jetty black. The bill is orange-coloured at its base and black at the top. The average height of a full-grown F. is 6 feet. The common American species is larger and brighter in colour than the European bird. It occurs in the warmer regions of the continent and amongst the W. Indian Islands, is often met with in W. Florida and N. Alabama, but is rare further N. or W.

Flamingo.

Flamin'ia Via, the famous highway leading N. from Rome, issued from the city by the Flaminian Gate at the northern angle of the Capitoline Hill. It proceeded to Narnia, in Umbria, and thence by Fulginia to Fanum Fortunæ on the Adriatic, from which it passed on to Ariminum, beyond which it extended under the name of the Æmilian Way through Cis-Alpine Gaul. One loop-line left the main road at Narnia, and passing through Interamna and Spoletium, rejoined it at Fulginia. Another, striking off at

Nuceria, diverged to Ancona, and united with the main road at Fanum Fortunæ.

Flamini'nus, T. Quintius, the most distinguished representative of a family of the Quintian gens, was born about 230 B.C. He was elected consul, B.C. 198, and obtained Macedonia as his province. He threw himself with great ardour into the war with Philip, and in the course of the struggle both achieved military successes and displayed great diplomatic skill. After the complete defeat of the Macedonians at Cynoscephalæ, B.C. 197, terms of peace were concluded, by which Philip relinquished all his Greek possessions in Europe and Asia; and during the Isthmian games of 196 B.C., F. proclaimed the freedom of Greece. He took leave of the Greeks, B.C. 194, and on his return to Rome celebrated a splendid triumph of three days' duration. Peace was soon disturbed by the war in which the treacherous Nabis, tyrant of Sparta, was subdued. The most notable event in the subsequent career of F. was his connection with the death of Hannibal, who took poison, fearing lest he should be delivered up to the Romans by Prusias of Bithynia. F. died in 174 B.C.

Flaminio, Marcantonio, an illustrious Latin poet, was born at Seravalla in 1498. Cardinal Pole became his patron and took F. with him to the Council of Trent in 1545. Among his works are the translations of thirty Psalms and several hymns and poems, all in Latin. His composition was remarkable for elegance. He was of an amiable and gentle character. Died at Rome in 1550.

Flamin'ius, Caius, was tribune of the Roman people, B.C. 230, and carried by popular support an agrarian law for the distribution of the recently-conquered territory of the Cis-Alpine Gauls. When consul (223), F. gained a great victory over the Insubians. His censorship (220) was distinguished by the two great works that bear his name, the *Circus F.* and the *Via Flaminia.* He was elected consul for the second time (217), and immediately marched against Hannibal, who was advancing southwards. F., with the greater part of his army, perished in the battle on the shores of Lake Trasimenus, B.C. 217.

Flam'steed, John, the first astronomer-royal of England, was born at Denby, near Derby, 19th August, 1646, and at an early period showed so remarkable a power in the calculation of eclipses of the moon, that through Sir Jonas Moore, then Surveyor-General, he was appointed astronomer to the king in 1675. The same year he took holy orders, and, nine years later, was presented to the living of Burslow, in Surrey. Scientifically he is chiefly remarkable as the earliest of practical astronomers. He made the first valuable catalogue of the fixed stars, and was the first to introduce the method of simultaneously observing the right ascension of the sun and stars. F. died 31st December, 1719. The partial publication of his leading work, *Historia Cœlestis Britannica*, by Halley, against his wish, led (as was ascertained from the publication of some of his papers in 1835) to a quarrel between F. and Halley, in which Sir Isaac Newton was involved. This work, which was begun to be printed along with an *Atlas Cœlestis* in 1719, was not published till 1725. See Baily's *Account of the Rev. J. F.*

Flanch, The, in heraldry, is a segment of a circle drawn on each side of the shield, and is said to have had its origin in the dress of the 14th c. Guillin says that flanches are 'a proper reward for the services of a gentlewoman to her sovereign.'

Flan'ders (Flem. *Vlanderen*) is the name of a territory in the basins of the Scheldt and Lys which has often varied in extent, and which was formerly a powerful sovereign county. The ancient occupants of this country, whom Cæsar subdued, were the Celtic Morini, and various savage German tribes, as the Nervii and Menapii. The name F. was derived from the *Vlandergau* (*pagus Flandrensis*), but this was merely the district surrounding Sluis and Bruges. In the time of Karl the Great, F., then a region of wild morass and dense vegetation, was placed under a race of bold 'foresters,' who easily wrested the territory from his feeble descendants. By the Treaty of Verdun (843) F. and Artois were acquired by the Karolings of the newly-formed western Frankish kingdom. On the irruption of the Northmen the vassal rulers of the country were made wardens of the Frankish north-eastern coast. In 864, Judith, daughter of Karl the Bald, and widow of Æthelwulf of England, was married to Baldwin (q.v.), surnamed *Bras-de-Fer*, who subsequently was created 'Count' of F., and who laid the foundation of the industrial greatness of his 'mark' or county. Among his more prominent successors was Baldwin IV., the Bearded (988-1036), who became a prince of the empire by receiving in fief from Heinrich II. the burgrafdom of Ghent, Walcheren, and the Zeeland Islands. The son of Baldwin IV., the Pious, Baldwin V., gained a part of Lower Lothringen, between the Scheldt and Dender (the *Alosterland*), the episcopal supremacy of Cambrai, and the county of Hainaut (Hennegau), founding the Flemish-Hainaut line in 1070. Of this line, the Flemish section died out with Baldwin VII. in 1120, whereupon some six claimants strove to gain the succession, which was finally secured by Dietrich of Elsass in 1128. Grown by this time into a flourishing state, F. had given crusading dynasties to Jerusalem and to the Latin empire of Constantinople. The Flemish weavers, rapidly becoming wealthy merchants, were beginning to receive a share of the political recognition foreshadowed by the first civic charter or *keur* granted to Middelburg in 1217. During the French and English wars of the 13th c., F. aided the latter power, although nominally a vassal of the former. In 1280 Margarethe II. died, leaving two sons by different marriages, John of Avennes and Guy Dampierre, who succeeded to Hainaut and F. respectively. The revolt of Guy against Philippe le Bel (1297) led to the conquest of F. and its annexation to France; but the Flemings achieved their independence by the famous 'battle of spurs' at Courtrai in 1302. Under the oppressive rule of Count Louis I. of Dampierre, grandson of Guy, occurred the turbulent popular outbursts headed by the Arteveldes (q.v.). By the marriage of Philip I. of Burgundy the family of Valois-Burgundy replaced that of Dampierre in 1369, and F. was brought within the circle of the German empire. (See BURGUNDY.) Meanwhile F., along with Holland, was fast attaining its highest reach of material splendour; and its rich populous cities, Ghent, Bruges, Ypres, &c., were ready to resist any encroachment on their 'liberties.' After the death of Charles the Bold (1477), and the consequent disruption of the Burgundian possessions, F. went to his daughter Marie, who married Maximilian of Austria. The Treaty of Madrid (1526) formally abolished the vassalage of F. to France. On the abdication of Charles V. in 1556, F. came to the Spanish line of the House of Hapsburg with Philip II., but the territory was subsequently much diminished by the Peace of Westphalia (1648), which transferred a portion in the N. to the States-General, and by the conquests of Louis XIV. secured to France by the treaties of Aix-la-Chapelle, Nymwegen, and Utrecht. By the Congress of Rastadt (1714) the remainder of F. came again to the House of Hapsburg; but it was conquered by the French in 1794, and remained an integral part of the republic and empire till the Congress of Vienna (1814) conferred it on the kingdom of the Netherlands. It now forms the two Belgium provinces, East and West F. (q.v.).

Flanders, East (*Oost Vlanderen*), a province in the N.W. of Belgium, with an area of 1158 sq. miles, and a population of 970,398. It has a flat surface, and is watered by the Scheldt and its tributaries the Dender and Lys. The soil, which has undergone spade-culture, is very rich, yielding various grains, flax, hops, hemp, &c. Fine flax is produced in the *Land van Waes*, a region between Antwerp and Ghent, formerly a barren heath. E. F. is portioned into a great number of small farms, and is one of the most populous parts of Europe. There are large linen, cotton, woollen, lace, and silk industries, besides numerous breweries and distilleries. Ghent is the capital, and among the other towns are Alost, St. Renaix, Lockeren, and Eecloo.—**West F.,** the most westerly province of Belgium, is bounded N. by the North Sea, and W. and S. by France. Area, 1249 sq. miles; population, 755,349. It is watered by the Lys and Iser, and is level and highly cultivated, except along the coast and in the N., where there are broad, low sand-dunes, in part covered with pine-trees. The industries and manufactures are on somewhat a smaller scale than those of E. F. but are similar in character. The chief towns are Bruges, Ostend, Courtrai, and Ypres.

Flandrin, Jean Hippolyte, an eminent French historical painter, was born at Lyon in 1809 and became a pupil of Ingres, through whose influence he was appointed director of the French Academy at Rome. In 1838 he settled at Paris, where he remained till 1863, when, owing to bad health arising from excessive application, he went to Rome for change of air and relaxation. There he was carried off, in 1864, by an attack of small-pox that lasted only three days. Among his works are 'Euripides writing Tragedies,' 'Dante conducted by Virgil' (1845) and 'Napoléon Législateur' (1847). His composition and design were excellent, and his talent as a portrait painter was far above the average. His splendid frescoes, left unfinished, at the church of St. Germain-des-Près were entrusted to Cornu for completion.

Flange, in construction, a projecting rim placed round the edge of various parts of machines or apparatus. It serves commonly to afford the means of connecting (by bolts) the piece to which it belongs with other parts of the machine, but in some cases it has an entirely different purpose, as in the flanges of railway carriage wheels.

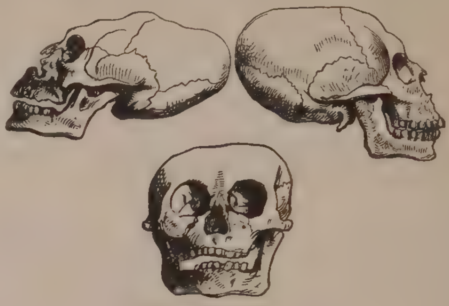
Flank (*i.e.*, 'the side'), in a military sense, means the extreme right and left of an army or encampment. To *flank* is to take up such a position as will strengthen the main body of an army or brigade, and at the same time have the men who perform the evolution well out of range of the enemy's fire. To *outflank* is to increase one's front so that by extending the line a general will be in a position to threaten or command the flanks of the opposing but less widely-extended line. *F. companies* is the name applied to the grenadiers and light infantry companies of regiments, as these generally occupy the right and left extremities when a battalion is in line. *Flanking parties* are bodies of cavalry and infantry employed to harass the flanks of an enemy. *Flanks of a frontier* are forts at the extremities of a frontier line, within which an attacking force will be careful not to enter, lest his retreat be cut off. For F. in fortification, see FORTIFICATION.

Flann'el (Welsh *gwlanen*, Fr. *flanelle*), a woven woollen fabric of a loose texture, much used for underclothing, shirting, &c., on account of its softness and warmth. Wales still sustains the reputation it early earned for the excellence of its hand-made F. Many varieties of the fabric are produced at Rochdale, Halifax, Leeds, Bury, and Salisbury.

Flat, in music (denoted thus, ♭), a sign indicating the substitution of a note a semitone lower for the note on the staff before which it is placed. See NOTATION.

Flat-Fish, the common name for the flounder, plaice, sole, turbot, brill, halibut, and other Teleostean fishes belonging to the family *Pleuronectidæ* of the section *Anacanthini*. They can only be called *flat* in the sense that their *sides* are flattened to a much greater extent than is common in other fishes. Most people mistake the flat sides for the back and belly, but an examination will show that the paired breast-fins exist one on each flattened surface or side, whilst the dorsal and hind fins fringe the back and lower surface of the body respectively. These fishes swim on the light-coloured side; and both eyes, through a curious mal-formation of the bones of the skull, come to exist on one side of the body. The two sides of the mouth are of unequal size.

Flat-Heads, signifying certain tribes of American Indians among whom exist a custom of mechanically flattening the heads of their infants. From the illustrations the reader will perceive that the top of the skull is almost a horizontal plane and the compression has the effect also of making the skull and face broader and the conformation of each side different to that of the other; the jaw will also be seen to be distorted laterally. The principal tribes which adopt this barbarous practice are the Calapuyas, Clickitats, Clatsops, Chinooks, Clatsani, and Cowalitsk. It is remarkable that the treatment does not affect the brain though it renders the deformed more liable to apoplexy. By the time the Flathead reaches adult age all traces of the distortion are lost and the skull has resumed its proper shape. The custom, which is now dying out, was prevalent in former times among the Indians of Mexico, Peru, Central America, and among the Choctaws and Caribs.



Skulls of Flathead Indians.

Flatt'ery, Cape, the name of two headlands—(1) One in the territory of Washington, U.S., on the S. side of the entrance to the strait of Juan de Fuca. (2) One on the N.E. coast of Queensland, about 30 miles N. of Endeavour Bay.

Flat'ulence (from Lat. *flatus*, 'a breathing or blowing'), distension of the stomach, &c., by the formation of gases during digestion, depends more upon a disordered condition of the alimentary canal than upon the nature of the food partaken. F. may be relieved by the use of aromatic medicines, such as anethi, carui, cinnamon, peppermint, cloves, ginger, cardamoms, &c.

Flavel, John, an eminent English clergyman, was born near Bromsgrove in Worcestershire in 1627. Having received his education at Oxford he was ordained, and in 1658 became rector of Dartmouth. He was one of the 2000 clergymen who were ejected for *nonconformity* in 1662. He, however, continued to preach in lanes, forests, and out-of-the-way places till 1687, when by royal license the restrictions enforced under the Act of Conformity were removed, and he was permitted to return to the public performance of his duties. His writings, which were highly esteemed, include *Divine Conduct* and *Method of Grace*. Died in 1691.

Fla'vine is the name given to certain commercial colouring matters obtained from quercitron. The name is also given to a totally different substance, the diphenyl urea. F. is imported chiefly from the U.S. of America.

Flax (*Linum*), a genus of Exogenous plants belonging to the natural order *Linaceæ*. It has five imbricated sepals, and five contorted petals. The ovary has five divisions, each of which is subdivided by a false septum or partition. The plants of this order are herbs with entire sessile leaves. They are found in various quarters of the world, but most commonly in Europe and N. Africa. Common F. (*Linum usitatissimum*) is the best-known and most celebrated species. It grows as a smooth annual with a fibrous root, and attains a height of about two feet. The flowers are blue. At the present time F. is cultivated in many parts of the world. F. is the Hebrew *pishtah* of Exod. ix. 31, the *linon* of Matt. xii. 20. The seeds are dark brown and of oblong shape, averaging about one line in length. A variety of the common F. named *L. humile* is grown to a large extent on the Continent. The F. plant becomes commercially of importance not only from the uses of the fibrous or woody tissue, obtained from the inner bark, in the manufacture of linen, but also from the drying oil expressed from the seeds, and known as 'linseed oil.' The crushed seeds form the 'oil-cake' so largely used in feeding cattle, and 'linseed meal' is obtained by grinding the crushed seeds after the oil has been expressed. Mixed with lime-water, linseed oil forms the 'carron oil' employed in the treatment of burns. 'Tow' is the product obtained in the process of 'heckling' the F. fibres. *F. cotton* is formed by steeping F. fibres, first in a solution of bicarbonate of soda, and then in a weak acid solution, so as to separate and break up the fibres to form a substance used in cotton manufacture. F. has been cultivated from the earliest times of which we have any authentic record. Thus F. linen was used to swathe the mummies of Egyptian tombs, and Herodotus refers to the extent of the Egyptian F. trade. In Ireland, F. is much more extensively grown than in England and Scotland, and in Belgium is cultivated to an extent probably unequalled elsewhere. *Brussels lace* is made from a fine F. grown in both W. and E. Flanders, and which sells at prices varying from £100 to £180 or more per ton. In 1894, 61,927 tons of dressed and undressed F. were imported into the United Kingdom, and the value was estimated at £2,296,365; of this amount of F., 49,869 tons came from Russia; 6815 from Belgium; 2114 from Germany, and the rest from Holland, France, Turkey, U.S. of America, Australasia, &c. In the same year 9774 tons of Tow or Codilla of F., valued at £228,830, were also imported; 6099 tons came from Russia, 1823 from Belgium, and the rest from Holland, Germany, France, &c. On the other hand we exported 36,441 tons of dressed and undressed Flax and Hemp, which were valued at £192,793. In India F. appears to be grown chiefly for the seeds, which afford oil. When sown thickly, the F. plant yields the finest fibre, as also when the plants are pulled before the ripening of the seed. The name *purging F.* has been given to the *Linum catharticum* from its purgative properties. The latter is common enough in Britain, but is only used in popular and herbal systems of medical treatment.

Flax.

Flax'-Dressing. The fibre of the flax plant is prepared for the spinners' use by the processes of seeding, steeping, rolling, drying, stacking, breaking, and scutching. Seeding is effected by quickly drawing the flax straw between the two iron rollers, so fixed as to press out the seed without injuring it. An iron comb, called a ripple, with long and closely-set teeth, was formerly used for removing the seed-bolls. Steeping, or water-retting, is carried on by immersing the flax in a stream or pool of water. Fermentation ensues, and the glutinous matter which binds the fibre to its woody core is decomposed, facilitating the separation of the fibres. In Continental countries the flax is often sparsely spread on the ground, and exposed to the decomposing influence of dew and rain. This practice is distinguished as dew-retting. Improved methods of retting by which a great saving of time is effected and the work more efficiently accomplished, are general. Schenck's plan was introduced into Ireland in 1847. The flax is placed in vats containing water, the temperature of which is raised to and maintained at 90° by means of steam-pipes placed under a perforated false bottom. The average duration of steeping by this method is sixty hours. On the removal of the flax from the vats it is passed between heavy cylinders on which a copious supply of water falls. By this rolling residual impurities are extracted and the fibres further loosened. Atmospheric drying follows, and then the straw is sheaved and stacked for two or three months to improve its quality and facilitate cleaning. Breaking and scutching, by which the fibres are cleaned of the woody part of the stem and separated from each other, are next proceeded with. On the successful performance of these operations chiefly depends the value of the flax. Breaking and scutching machines of varied construction are everywhere superseding manual labour. The woody part is crushed by passing the straw between fluted rollers, and then in the scutching machine the fibres are freed from the broken wood by beaters or brushes. The flax fibre is much injured in the last machine, which causes the production of an excessive quantity of tow. See LINEN MANUFACTURES and SPINNING.

Flax'man, John, a great English sculptor, born at York, 6th July, 1755, was the son of a figure-moulder of the Strand, London, in whose studio he learned to draw and model, entered the Royal Academy, and exhibited a figure of Neptune in wax in his fifteenth year. He married in 1782, and in 1787 set out for Italy, where he executed his fine series of illustrations for the Iliad and the Odyssey, the beautiful marble group 'Cephalus,' 'Aurora,' &c. Returning to London in 1794, he was elected R.A. in 1800, and Professor of Sculpture in the Royal Academy in 1810. He died 7th December, 1826. In his series of 109 illustrations of Dante he established his fame as a designer of noble conception and exhaustless invention. His numerous mural works, many of them in Westminster Abbey, and all inspired with noble simplicity and elevation of feeling, constitute F. one of the chief authors of the Renaissance of rilievo. Of his monuments, those in memory of Sir Joshua Reynolds (statue in St. Paul's Cathedral), Sir W. Jones (University College), Sir F. Baring's family (Micheldean church, Hants), Countess Spencer, and Mrs. Tighe, are among the most famous. A valuable collection of the models of many of his chief works may be seen in the Flaxman Museum, University College. See Flaxman's *Classical Compositions*, *Illustrations of Dante*, and *Acts of Mercy*.

Flax, New Zealand. See PHORMIUM.

Flea, a genus of Insects belonging to the Holometabolic section of the class, and to the order *Aphaniptera* ('hidden winged'). They undergo a complete metamorphosis, but have no wings, these being represented by certain of the plates upon the thorax or chest-segments. The mouth is adapted for suction. The fleas, of which the common F. is an example, are parasites. The larvæ first appear as footless grubs, which pass into a quiescent state within a cocoon in about twelve days. They emerge from the cocoon in about fourteen days. The F. bites sharply, and is exceedingly active in its movements, the legs being very long. The parts of the mouth are modified so as to provide the creature with a set of instruments admirably adapted for piercing the skin of the animals upon which it resides. Another and much more important species of F. is the Chigoe (q.v.) of the W. Indies. Fleas have sometimes been trained to perform amazing feats, such as drawing miniature carriages to which they have been attached.

Flea'bane, a genus of Dicotyledonous plants belonging to the natural order *Compositæ*, and so named from its strongly aromatic smell having been supposed to be serviceable in exterminating fleas and other insect pests. The dysentery F., a familiar species, commonly found in damp places, derives its specific name from having been used as a remedy for diarrhœa and dysentery.

Flèche, La (Fr. 'the spire'), a town of France in the department of Sarthe, on the right bank of the Loir, 24 miles S.S.W. of Le Mans. The church of St. Thomas, whose ‘spire’ gives name to the place, is a Romanesque structure of the 11th and 12th centuries. The College of Jesuits, founded by Henri IV. in 1603, is now the famous Prytanée, a military school, with accommodation for 800 pupils. In one of the squares of the town is a bronze statue of Henri IV. Descartes was born here, and within the town resided David Hume in 1735-36 while composing most of his *Treatise on Human Nature*. The principal manufactures are cloth, paper, hosiery, and glue; there are flour and bark mills, and quarries of tufa. There is a trade in cereals, wines, and fruits. Pop. commune 10,249; arrond. 91,375.

Fleck'noe, Richard, was a dramatist of the 17th c., who seems to have been originally a Roman Catholic priest, and to have come from Ireland to seek his fortune in London by his pen. F., who was born about 1610 and died in 1678, wrote a number of plays, including *Demoiselle à la Mode*, *Love's Dominion*, and *Marriage of Oceanus and Britannia*, all of which are now forgotten, and some fugitive verses which Southey has praised. F. is best known by Dryden's satire of *Mac Flecknoe*, the model of Pope's *Dunciad*.

Fleet (Old Eng. *fliet*, ‘what floats,’ ‘a ship’), now denotes a collection of vessels, but is generally applied to warships. The collective F. of a country is spoken of as its navy. The different divisions of this are known as ‘fleets,’ each being under the command of an admiral, and the portions of a F. are known as *divisions* and *squadrons*.

Fleet Prison, or **The Fleet,** for centuries a notorious London gaol, stood on the E. side of Farringdon Street, on the banks of the Fleet stream, formerly a rapid affluent of the Thames, and now embraced within the system of the sewage of the city. It was king's prison and also debtors' prison from before the commencement of the 13th c. Here the religious martyrs of the reigns of Mary and Elizabeth were confined, and later the victims of the Star Chamber. The building was several times renewed. It was destroyed in the great fire of 1666, again burnt by the Gordon rioters in 1780, and finally abolished in 1845 as a public nuisance. It was the scene of much irregularity and brutality, arising mainly from the extortions of the keepers, and of the *Fleet Marriages*, which were contracted chiefly from the middle of the 17th to the middle of the 18th c. Prior to the passing of the Marriage Act of 1754, all that was required to render a marriage valid in England was the verbal and expressed consent of the parties; and as the Fleet at the time contained a number of dissolute ex-parsons, who were ready to celebrate a secret marriage for half-a-crown, or, according to Pennant, ‘for a dram of gin or a pipe of tobacco,’ persons wishing to marry, yet to keep their marriage secret, flocked to the Fleet. The Marriage Act of the 27th March, 1754, put an end to the trade of the Fleet parsons; yet, as a sign of the popularity of the F. marriage, it is said that over 200 marriages were entered in one register on the day before the Act came into force.

Fleet'wood, a seaport in Lancashire, at the mouth of the Wyre, 18 miles N.W. of Preston, and 228 miles from London by rail. It is a handsome modern town and a favourite watering-place. The chief buildings are the Whitworth Institute, the market-house, St. Peter's church, and the Roman Catholic church. F. has spacious barracks and a fine harbour. In October, 1877, the London and N. Western and the Lancashire and Yorkshire Railway Companies opened a new dock and large timber pond at a cost of £300,000, and it was hoped that this accommodation would prove attractive to foreign trade and the traffic between England and the Irish ports. Liverpool, however, retained its popularity. There is a daily boat-service between F. and Belfast, and a considerable fleet of fishing boats belong to the port. It is a most popular and healthy resort of summer visitors. Pop. reg. sub-dist. 12,888.

Flem'ish Language and Literature. The name Flemish is now limited to the Germanic dialect of Belgium, though modern Dutch and Flemish, or *Vlaemish*, were at first the same tongue. The present Flemish speech differs from Dutch only in having fewer guttural sounds, and in having borrowed a number of French idioms; but while it has, until late years, received little cultivation, and been used almost solely for popular tales, songs, and farces, in Holland the old *Vlaemish* has long been a literary tongue under the distinct name of *Dutch*. By Flemish is now meant the language of Flanders, N. Brabant, and part of S. Brabant—the *Walloon*, a French dialect, prevailing in Walloon Brabant, Liège, Namur, and part of Limburg. Under FLEMISH LITERATURE, however, must be included the early writings in *Flemish*, whether produced in what is now Holland or in what is now Belgium, while the modern Dutch literature from the 16th c. onwards will be treated under LITERATURE OF THE NETHERLANDS. Among the earliest relics of Flemish are three works of the 12th c., *De Trojaensche Ooorlog*, a poem of above 3000 lines on the siege of Troy, by Dieregodgaf; the *Reis van Sinte Brandaen*, a wild monkish tale of the wondrous adventures of St. Brandan, full of fantastic inventiveness; and *Reinart de Vos*, a version of the famous satirical poem *Reynard the Fox*, written, according to Willems, most probably about 1170. To the 13th c. belong the poets Melis Stoke, Jan van Heelu, Heijnric van Holland, Willem Utenhoven, and Jacob van Maerlent, ‘the father of Dutch poetry.’ The civil wars of the 14th c. checked the growth of literature, but chivalrous tales, borrowed largely from France, such as *The Holy Grail*, *Lancelot*, *Roland*, &c., became popular, and in 1394 the first of the *Kamern der Rederijkern*, or Chambers of Rhetoric, was founded. These *Rederijkern* were institutions corresponding to the guilds of the German *Meistersingers*, which offered prizes for poetic competitions, and gave public representations of farces and *Spelen van Sinne*, or moralities. They were founded in imitation of the French *Colléges de Rhétorique*, and had a baneful effect on the purity and correctness of the Flemish tongue. As their members were chiefly mechanics, though at first many of them were *sprekers*, or vagrant minstrels, they kept alive a taste for literature among the lower classes, but flooded the language with corrupt phrases, and rendered its grammar lax and uncertain. The lampoons and satiric dramas produced under their influence partly fulfilled the censorial functions of the modern press, and at times displayed an almost Aristophanic heartiness and extravagant vigour of ridicule and rebuke. Among the peculiar forms of poetry developed by the Rhetoricians were the *ketendichten*, ‘chain-poems,’ in which the last word of each line rhymed with the first word of the following; *dobbelsteert*, ‘double tail,’ in which each line ended with a double rhyme; and *scaekberd*, ‘checker-board,’ poems of sixty-eight rhyming lines, so arranged as to form in every direction a strophe of eight lines. From the 14th to the end of the 16th c. was the age of the Flemish ballads and popular songs, many of the latter being religious, and comprising Christmas carols, *Ave Marias*, Easter hymns, the ballads of Sister Bertha, &c. In the 16th c. Holland, after its struggle with Spain, continued to produce a national literature, whilst the Flemish literature died away in the Belgic provinces. In the 16th c. the Flemish language received a large French infusion, and after 1694, when the French invaded Belgium, French for a time superseded Flemish in the journals, and even in polite conversation. After the annexation of Belgium by Holland, the Dutch efforts to conciliate the Flemings by favouring the Flemish language were very coldly received, and tended on the whole to strengthen a reaction against the old dialect; until, after the separation of Belgium from Holland in 1830, a strong Flemish movement, headed by Willems, arose. Since then a Flemish literary school has developed, of which the chief representatives are Willems, Van Ryzwick, Van Deyse, Snellaert, Snieders, and Conscience, several of whose works have gained a European fame. The most elegant of Belgian periodicals, the *Nederduitsch Tijdschrift*, founded in 1862, is composed in Flemish. The chief Flemish authors have now agreed to write Flemish with the same orthography as the Dutch. See Vandenhoven, *La Langue Flamande, son Passé et son Avenir*.

Flemm'ing, Paul, a German poet, born at Hartenstein, Schönburg, 15th October, 1609. He studied medicine at

Leipzig, accompanied legations to Russia in 1633 and to Persia in 1635-39, and died at Hamburg, 2nd April, 1640. F. belonged to the first Silesian school founded by Opitz, and his works *Geistliche und weltliche Poemata* (1642, 1865), were unequalled by any German poet of the 17th c. They are vigorous and graceful in expression, lofty in thought, and full of interesting allusions to F.'s times. F.'s noble hymn, *In allen meinen Thaten*, is still sung in German churches. A selection of his poems was published by Schwab (Stutt. 1820), accompanied with a memoir of the poet's life.

Flens'burg, an old town in the province of Slesvig-Holstein, Prussia, on the F. Fjord, 20 miles N. of Slesvig by railway. It is the chief trading town in Slesvig, and has steam and wind mills, large breweries, and iron-smelting works, brandy distilleries, paper factories, and shipbuilding yards, besides manufactures of tiles, machinery, glass, soap, colours, tobacco, &c. Over 1600 sailing and steam vessels of over 500,000 tons annually clear the harbour, which is capable of receiving vessels of considerable size; the entrance is, however, by no means easy. A flourishing export trade exists, consisting of brandy, tiles, fish, corn, tallow, soap, and hides. Pop. 36,816. F. is supposed to have been named from the knight Flenes, who is said to have founded it in the 12th c.

Flers, a town of France, department of Orne, on an affluent of the Noireau, 35 miles W.N.W. of Alençon, has cotton, linen, and other weaving manufactures, of the annual value of nearly £3,000,000 sterling. Pop. commune 13,860.

Flesh, Chemical Composition of. F. or muscular fibre is composed mainly of fibrine in the coagulated condition, owing to the supply of blood constantly saturating the capillaries. Ordinary F. contains a certain quantity of that fluid, and therefore of its peculiar constituents, whilst in the juice which may be expressed from F., and which forms at least three-fourths of its weight, are found phosphoric, lactic, and butyric acids, partly in the free state, partly combined with potash and soda, lime and magnesia; chloride of sodium or common salt is also present. The juice of F. also contains a peculiar saccharine substance termed *Inosite* (q.v.), and an azotized body having feebly basic properties called *Creatine* (q.v.). The composition of muscle has been given as follows:—

Water	74·0	80·0
Solid constituents	26·0	20·0
	100·0	100·0
Albuminous substances insoluble in water	15·4	17·7
Gelatine	0·6	1·9
Albuminates of soda coagulating at 113° F.	2·2	3·0
Creatine	0·07	0·14
Fat	1·5	2·30
Lactic acid	1·5	2·30
Phosphoric acid	0·66	0·70
Potash	0·50	0·54
Soda	0·07	0·09
Chloride of sodium	0·04	0·09
Lime	0·02	0·03
Magnesia	0·04	0·05

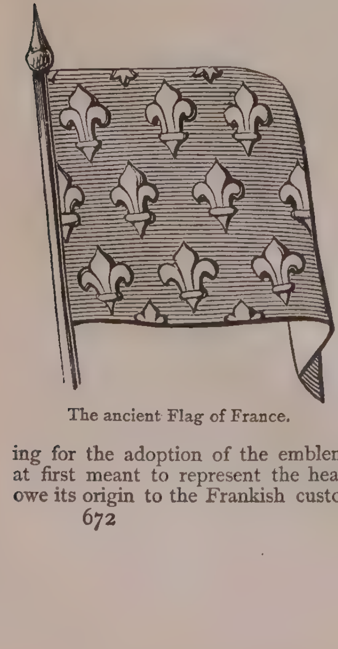
Flesh-Fly, a species of *Diptera* or flies, so named from their depositing their eggs in decaying animal matter, and from their larvæ feeding on like substances. These larvæ thus become useful in removing putrefying material. Linnæus said that three flesh-flies could devour a horse in less time than a lion—meaning that the various broods of larvæ, produced in large numbers, would in turn attack and devour quantities of the putrescent matter. The eggs are hatched within the body of the parent F.-F., and the pupæ or chrysalides are contained within the larval skin. The F.-F. is commonly called *Blue-bottle fly*.

Fleta, an important compendium of the laws of England down to the 2nd Statute of Westminster, was probably written in the year 1286 or soon after. The composition and arrangement are, considering the age, highly creditable. The work is so called from its having been written in the Fleet Prison, and is said to have been compiled by order of the king, Edward I.

Fletch'er, Andrew, of Saltoun, a Scottish patriot and political writer, was the son of Sir Robert F. of Saltoun, where he was born in 1653. After travelling on the Continent, F. entered the Scottish Parliament as member for East Lothian in 1681, but having borne part in the opposition to James, Duke of York, then Royal Commissioner in Scotland, he was compelled to retire to England, and thence to Holland. Shortly afterwards he was outlawed, and his estate confiscated, whereupon he threw himself into the patriotic intrigues of the English refugees in the Netherlands. F. returned to England in 1683, and there became intimately associated with the leaders of the malcontent party—the famous Council of Six. The discovery of the Rye House Plot (1683) scattered this party, and F. again fled to Holland. In 1685 he came back to England as volunteer in the Duke of Monmouth's invasion; but having killed the Mayor of Lyme in a private dispute, he was forced to quit the expedition at its very outset. F. then served in Hungary with distinction against the Turks. On the revolution of 1688 he came over from Holland with William of Orange, regained his lands, and again sat in the Scottish Parliament. The failure of the Darien scheme, in which F. had been a prime mover, embittered him towards King William's government, and in the Scottish Parliament he spoke violently against the projected union between England and Scotland. After the Union F. retired from public life. He died in London in 1716. F. was a passionate lover of freedom, but though a republican, was even more opposed to democracy than to monarchy. His views are set forth in several tracts—*Discourse of Government with Relation to Militias* (Edinb. 1698); *Two Discourses on the Affairs of Scotland* (1698); his *Speeches in Parliament* (1703); and *Conversation on Governments* (1704). These were reprinted at London in 1737 as *The Political Works of A. F.* There is an *Essay on the Life of F.* by the Earl of Buchan (1792). See also Macaulay's *History*.

Fletcher, Giles and **Phineas,** poets, sons of Dr. Giles F., uncle of F. the dramatist. Giles, born in 1588, was educated at Cambridge. In 1610 he published *Christ's Victory and Triumph in Heaven and Earth over and after Death*, a poem in an eight-line stanza. It is tedious and affected, but at times rises into lofty imaginative poety. F. held the living of Alderton, Suffolk, where he died in 1623.—Phineas F. was born at Wanbrook, Kent, April, 1584, was educated at Cambridge, obtained Hilgay Rectory in Norfolk, and died in 1650. His works include *The Locustes* (1627), a satire on the Jesuits; *Sicelides, a Piscatory*; and *The Purple Island*, a poem in ten cantos, in which the human body is allegorically described. It is written in a seven-lined stanza, and though grotesque and prolix, is smoothly versified, with rich descriptive and lofty moral passages. Like his brother, Phineas was an ardent disciple of Spenser. Quarles called him 'the Spenser of his age.' The poems of Giles and Phineas F. are contained in Anderson's *British Poets*, vol. iv.

Fletcher, John, one of the greatest of English dramatic poets, was born in 1576. He was the son of Richard F. who became Bishop of London, was sent to Bene't College, Cambridge, in 1591, and was left an orphan and in poverty on his father's death in 1596. Nothing is known of his life until 1607, when he produced commendatory lines on Jonson and the comedy of *The Woman-Hater*, in which he may have been assisted by Beaumont, with whom he formed the most famous of all literary partnerships. F. and Beaumont are said to have lived 'on the Banke-side, not far from the Play-house,' and to have had even 'the same cloathes and cloake in common.' We know that F. was highly popular in the literary Bohemia of his times, with which he would be more closely connected than was his aristocratic associate. Beaumont died in 1616, and F. continued to write plays, alone or with other dramatists, until he was cut off by the plague in August, 1625. Modern critics have sought to disentangle F.'s from Beaumont's writings; but while we know that a particular series of dramas was produced by F. after Beaumont's death, we must view with dubiety all attempts to separate the one poet's verses from the other's in the pieces of which it is certain that they were joint authors. Donne regards the problem of sifting Beaumont's writing from F.'s as insoluble. Ward cannot trace any essential difference between the plays ascribed to both and those attributed to F. alone, while he can detect two styles in the plays written by F. along with another than Beaumont. The assertion that Beaumont merely pruned and chastened F.'s writings is contradicted by the verses of their contemporaries, and the plays (as *The Maid's Tragedy*) in which Beaumont unquestionably shared, do not show calmer judgment than those written by F. alone. Dyce assigns the authorship thus:—By Beaumont and F.—*Four Plays in One, Wit at Several Weapons, Thierry and Theodoret, Maid's Tragedy, Philaster, King and no King, Knight of the Burning Pestle, Cupid's Revenge, Little French Lawyer, Scornful Lady, Coxcomb, Laws of Candy;* by Beaumont alone—*Masque;* by F. and Massinger—*False One, Very Woman;* by F. and Rowley—*Queen of Corinth, Maid of the Mill, Bloody Brother;* by F. and Shirley—*Noble Gentleman, Night Walker, Love's Pilgrimage;* by F. and Shakespeare—*The Two Noble Kinsmen;* and the remaining plays, except the *Nice Valour*, as to which he is uncertain, by F. alone. The plays of Beaumont and F. are marked by exuberant and fiery, joyous and wanton inventiveness, by unflagging dramatic interest, splendid rhetoric, and flowery poetic colour, and by a fascinating natural sportiveness which is found in no other Elizabethan writers. But they show little depth or subtlety of imaginative insight; they fail to portray intense passion; their characters are oftened weakened by the undue emphasis given to a leading quality; and their plots, though mostly woven with marvellous dexterity, are sometimes maimed and twisted to produce ingenious situations. So far as we can judge, Beaumont seems to have had the loftier tragic genius, F. the more active creativeness, the more sparkling wit, the nimbler and more versatile and graceful fancy. Beaumont's verse is more severe and simple than F.'s, which is distinguished by flowery volubility and liquid melody, by a sometimes too copious overflow of sweet and pellucid language. The comedies, in which Beaumont seems to have especially shared, display the parodistic vein and broad farce characteristic of Jonson, features absent from those pieces in which F.'s genius shines with the most brilliant and unborrowed lustre—his romantic comedies, plays which stand alone in our literature for a peculiar blending of varied qualities, for fluent grace of style, for tender sentiment brightened with dazzling wit, for delicate poetic beauties inwoven with humour and softly flushed with passion, for the captivating interest of the plot, and for the introduction of those pensive, aërial lyrics which are surpassed by Shakespeare's loveliest songs alone. See Dyce's edition of Beaumont and F.; W. B. Donne's *Essays on the Drama;* and Ward's *English Dramatic Literature.*



The ancient Flag of France.

Fleur-de-Lis (Fr. 'flower of the lily,' in Old English 'flower de luce'), the emblem of the French kings, whose royal banner, even in the time of the Merwings, seems to have been blue with gold lilies. Charles VI. is said to have reduced the number of lilies to three, as a symbol of the Trinity. There are many legends accounting for the adoption of the emblem; most probably it was at first meant to represent the head of a javelin, or it may owe its origin to the Frankish custom of placing a *reed* or *flag in blossom* instead of a sceptre in the hand of each newly-made king. In 1789 the F.-de-L. was displaced by the tricolour. During the Middle Ages the F.-de-L. was also the emblem of the Virgin, and was a favourite design on church decorations.

Fleuron.

Fleuron, a term in architecture signifying a small rose-like flower, with leaves around it, which was an ornament in the classic style, and most often found in the centre of the abacus of Corinthian capitals. The same ornament has been known among us as the honeysuckle pattern.

Fleuru's, a town in the province of Hainaut, Belgium, near the Sambre, 7 miles N. of Charleroi, and 2 N. of Ligny. An indecisive battle took place here between the troops of the Catholic League under Gonzalvo de Cordoba, and those of the Protestant Union headed by the Dukes of Brunswick and Saxe-Weimar, 30th August, 1622. F. was also the scene of the defeat of the Prince of Waldeck by the Duke of Luxembourg, 26th June, 1794; and of a victory of Jourdan over the Allies, brought about by the bad strategy of the Prince of Saxe-Cobourg, 26th June, 1794. Pop. 5109.

Fleu'ry, André Hercule de, Cardinal, a French statesman and ecclesiastic, was born at Lodève, in Languedoc, 22nd June, 1653. He studied at the Jesuits' College, Paris, was made almoner to the queen of Louis XIV., and, in 1699, Bishop of Fréjus. He gave up his bishopric in 1715, became tutor to Louis XIV.'s grandson, afterwards Louis XV., and insinuated himself into that prince's favour. He was elected into the Academy in 1721, was admitted to the Council of State in 1723, and in 1726 became a cardinal and prime minister of France. His administration was tolerably successful. He strove to economize and lighten taxation, and at first sought to maintain peace at almost any cost, but sacrificed the freedom of the Gallican Church to Ultramontanism, and was nerveless and vacillating in his foreign policy. In 1733 the court party forced him into the war of the Polish succession, on behalf of Stanislaus Leczinsky, Louis XV.'s father-in-law. The struggle ended in 1736, and in 1741 F. was compelled by court influence to take part in the war of the Austrian succession. He died at Paris, 29th January, 1743. F. was a well-meaning, benevolent, and peace-loving minister, but had not the energy needful in his position. He patronised learning, and added several valuable MSS. to the royal library. See St. Simon's *Mémoires.*

Fleury, Claude, Abbé, a French ecclesiastical historian, was born at Paris, 6th December, 1640. He was educated at first for the law, and is said to have been one of the ablest advocates in the Parliament of Paris, but coming under the influence of Bossuet and Bourdaloue, took priest's orders, shortly after which he became tutor to the sons of the Prince of Conti. His legal knowledge was shown in 1674 in the publication of *L'Histoire du Droit Français.* Four years later appeared his translation in Latin of Bossuet's *Exposition de la Foi Catholique,* while between 1681 and 1683 he issued three little works, *Les Mœurs des Israélites, Les Mœurs des Chrétiens,* and *Le Grand Catéchisme Historique.* Through the influence of Fénélon, F., who was a modest, amiable, and erudite man, was appointed first assistant tutor to the sons of the then dauphin, and subsequently confessor to the young king, Louis XV., as well as Prior of Argenteuil. The chief works written by F. during the latter part of his life are *Discours sur les Libertés de l'Église Gallicane,* published after his death, and his *Histoire Ecclésiastique* (1691-1720), published in twenty volumes. This work, in particular, has been much admired on account of its candour and impartiality, and F. himself, although a 'good Catholic,' was the reverse of a sectarian or a fanatic. He died 14th July, 1723. See Martin's *Œuvres de l'Abbé F.* (1837), to which there is prefixed an essay on his life and writings.

Fleu'ry, Flor'y, or **Fleurett'ée,** is applied in heraldry to an object of which the sides or ends terminate in *fleurs-de-lis.*

Flex′ure, in mathematics, is the bending or curving of a line or surface. A point of *contrary F.* or *inflexion* is the point at which a curve ceases to present convexity to a straight line without it, and begins to present concavity. Such a point cannot exist in curves lower than the third order. In engineering F. denotes the bending of loaded beams, and is of great importance in the theory of construction. See STRENGTH OF MATERIALS.

Flied′ner, Rev. Theodor, D.D., a philanthropic clergyman, born at Eppstein, near Wiesbaden, 21st January, 1800, studied at Göttingen, and in 1821 became pastor of a small Protestant community at Kaiserwerth, near Düsseldorf. F. is memorable as the founder of the Evangelical Deaconesses, who, though not a monastic body, correspond partly to the Catholic Sisters of Charity, visiting the sick and poor in their homes and in public institutions. F. laboured with great practical ability to organize these deaconesses, who have proved a boon to Germany. Institutions modelled on F.'s establishment at Kaiserwerth have been founded at London, Paris, Berlin, Alexandria, &c. F. died at Kaiserwerth, 4th October, 1864.

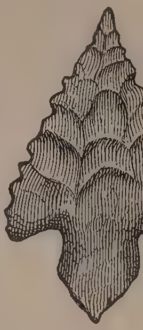
Flin′ders, Matthew, discoverer of great part of the coast of Australia, born at Donington, in Lincolnshire, in 1760, entered first the merchant service, and afterwards the royal navy. In 1798, F., in company with Surgeon George Bass, left Port Jackson, New South Wales, sailed S. along a coast previously unknown, and discovered and named Bass Strait between the continent and Tasmania. Subsequently in 1801-1803 he explored all the southern, eastern, and northern coasts of Australia from Cape Leuwen near its S.W. angle round by Bass Strait, and along by the E. coast, Gulf of Carpentaria, &c., to the Island of Timor. The voyage was one of romantic adventure as well as of great geographical achievement. On the return voyage F. was seized and retained prisoner in the Isle of France for six years. He reached England in 1810, and died there in 1814. His *Voyage to Terra Australia* (1814) is a work of high interest.

Flinder′sia, a genus of Exogenous trees belonging to the natural order *Cedrelaceæ*, or that including the mahogany trees. F. grows in Australia, and its hard wood is extensively used as a substitute for mahogany.

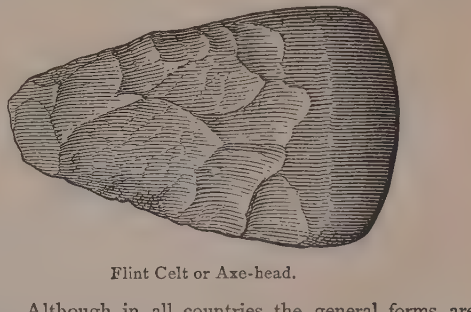
Flint is a variety of quartz, allied to chalcedony, from the purer specimens of which it differs in having usually a dark-grey or even black colour, and in being but feebly translucent. It is massive and compact, and breaks with sharp edges and a conchoidal fracture. It is found as concretionary nodules in the chalk formations, and is probably organic in its origin, Ehrenberg supposing it to consist for the most part of infusorial remains. *Hornstone* or *chert* is very similar, but is more brittle, and occurs in the limestones of older formations. The hardness and sharpness of F. ensured its early use as a material for the manufacture of knives, chisels, rasps, axes, &c.; and the facility with which it strikes fire upon steel is well known, though now of little practical importance since the invention of lucifer matches and percussion caps.

Flint, a town, formerly the county town, in Flintshire, 12 miles S.W. of Chester, on the W. bank of the Dee. Its chief buildings are a modern Gothic church, town hall, almshouse for twelve poor burgesses, schools, &c. It is a favourite watering-place, has chemical and smelting works, and exports coal and lead, which are obtained near it. The trade has increased, and F. has become to a certain extent the port of Chester, as sandbanks above it in the channel have rendered navigation up the river more or less difficult. To the N.E. of the town are the ruins of a castle built by Henry II. Many Roman remains have been found in its vicinity, and these point to the probability of F. having been a Roman station. There still exist some ruins of a castle which may have been built in the reign of Edward I. It unites with Caergwyle, Caerwys, Holywell, Mold, Overton, Rhuddlan, and St. Asaph in returning one member to Parliament. Pop. mun. bor. 5247; reg. sub-dist. 11,386; civ. bor. 4925; and dist. of parl. bors. 23,492.

Flint, a river in Georgia, U.S., joins the Chattahoochee after a course of about 300 miles, 250 of which are navigable for steamboats, from the Gulf of Mexico, as far as Albany.



Serrated Flint Arrow-head.



Flint Celt or Axe-head.

Flint Arrow-Heads, the commonest of the weapons of the Stone Age, occur abundantly in every country of Europe. They have been found also in Asia Minor and Palestine, in China and Japan, and in N. and S. Africa. They are plentifully distributed over the whole of the New World, and are still in use among the uncivilised tribes both of N. and S. America. Though varying greatly in form, they may be classified in three groups,—the triangular, the leaf-shaped, and the lozenge-shaped. The triangular group presents varieties, with or without barbs, with or without a central stem or tang, and sometimes with the base hollowed or notched for the insertion of the shaft. The leaf and lozenge-shaped forms, of which there are many varieties, were destitute of barbs and tang. They were inserted in the split end of the shaft, which was finely tapered off, so as to embrace the arrow-head almost up to its point. The grip of the split shaft on the flint was tightened by a lashing of sinew immediately behind the arrow-head, and seems in many cases to have been further strengthened by the use of gum or bitumen. Arrow-heads vary greatly in size, there being in fact no distinction between an arrow and a spear or lance-head except that of size. The smaller arrow-heads are often not more than a quarter of an inch in length, and they vary from this size up to the largest that a bow would carry. Whatever their size, they are always fashioned of chipped flint, and never finished by grinding, like axes and other such implements of flint of greater size. They are, however, by far the most symmetrically-formed and exquisitely-finished specimens of the flint-worker's art. The smallest examples, though not much thicker than card-paper, will exhibit from thirty to forty facets, each of which represents a blow so skilfully delivered as to flake off a splinter from the surface without fracturing the flint or injuring the symmetry of the weapon. Although in all countries the general forms are much alike, there are special varieties which are characteristic of special areas. The triangular variety, with barbs and blunt-ended tang, is most abundant in N. Britain, while that with a notch in the base is most abundant in Scandinavia. In France, Italy, and N. Africa the form with a pointed tang is most common. In N. America the triangular form with side notches for the reception of the sinew by which they are lashed to the shaft is the prevailing variety. Only a very small proportion of the flint implements found in the drift or in the cave-dwellings of England, France, and Belgium, and the kitchen-middens of Denmark, can be regarded as arrow-heads, but in the lake-dwellings of Switzerland they are very numerous and well made. They are frequently found in the dolmens or cairns and sepulchral deposits both of the Stone and Bronze Ages, but they are chiefly found casually embedded in the soil. It may be assumed that as arrow-heads of bronze are extremely rare, flint was used for this purpose throughout the Bronze Age as being the more accessible and less costly material. Among the savage tribes by whom it is still used, arrow-making is a work of skill in which only few attain excellence. Longfellow's description of the 'ancient arrow-maker' in *Hiawatha* has made us familiar with a phase of the life of the Stone Age continued into our time, but which is now fast passing away. Not the least curious of the phenomena connected with this passing away of an ancient art is that which is exhibited, not by the barbarian, but by the cultured and civilised sections of humanity, in the translation of these once familiar objects from the region of common life into that of the supernatural. In most of the civilised countries of Europe F. A.-H. have been for many centuries associated with supernatural powers and regarded with superstitious veneration. Even among the Etruscans this feeling seems to have prevailed, for there is in the British Museum a beautiful gold necklace from an Etruscan tomb, the central pendant to which is a flint arrow-head.

Flint Glass. See GLASS.

Flint Im'plements, the tools of times when the use of metal was unknown, or when it was too rare and costly to be applied to the commoner purposes of the useful arts, are found in every country of the world whose antiquities have been made the subject of special investigation. Not only do they occur in regions that had not emerged from barbarism in prehistoric times, but on the sites of the most ancient civilisations of historic times their occurrence bears testimony to a previous condition of undeveloped civilisation of which history knows nothing. They underlie the relics of the most ancient civilisations of Europe, Africa, and Asia, in Greece and Italy, in Egypt, in Arabia, Palestine, Asia Minor, Assyria, Babylonia, India, China, and Japan. In all countries where flint is naturally accessible, it has been used by preference for the manufacture of implements and weapons on account of the facility with which it may be flaked and chipped into the desired form. The flint tools of primitive times were principally knives, saws, scrapers, awls, axes or adzes, chisels and gouges. In the manufacture of the smaller tools a peculiar process was employed. A suitable block of flint having been selected, it was first split, and then by a series of sharp blows delivered on the fractured face of the flint long splinters or flakes were separated from the block or core in such a manner that the ridge formed by the meeting edges of the two flakes previously struck off formed the midrib or back-bone of the third. Each flake was thus triangular in section, and broad or narrow in the base opposite to the midrib, according to the purpose for which it was wanted. Knives were usually made of a long thin flake, the natural edge of which is keener than any that can be produced by grinding, so keen, indeed, that flakes of obsidian were used to shave with by the Spaniards in Mexico when their European razors went out of order, and Mariette Bey records that he once saw an Arab having his head shaved with a flint flake at Abydos in Upper Egypt. This natural edge, however, is extremely brittle, and flint knives which were intended to retain their utility, and were not merely made for the temporary occasion, were worked to a more obtuse edge than is obtained by the natural fracture. In rare cases, and probably for special purposes, the edge was ground. Practically owing to the roughness of the edge all stone knives are saws, but the true saws were beautifully and often very finely notched or toothed with the utmost regularity. Both knives and saws were small, not usually exceeding 3 or 4 inches in length. Sometimes they were set in handles of wood or stag's-horn. Specimens thus handled are found in the Swiss lakes. The 'scraper,' so called because a similar tool mounted in a bone handle is used to this day by the Eskimos for scraping the fat off skins, was made from a flake by trimming one of its ends to a semicircular bevelled edge like that of a 'round-nosed turning chisel.' Judging by the large number of these tools of all sizes, from a quarter of an inch to 3 inches in length and width, that are found on every site of human occupancy during the Stone Age, it is probable that they were used for a great many purposes in which scraping or planing was required, including the manufacture of implements of bone or wood, as well as the preparation of skins for clothing. It is also probable that many of them were used as strike-lights with iron pyrites, nodules of this substance with the marks of use having been found in barrows in association with 'scrapers' of flint. Another form of 'scraper' with a semicircular hollow was used for planing arrow-shafts. Flint axes and adzes are sometimes merely chipped into shape, but more frequently they are ground sharp and smooth at the cutting edge, and occasionally smoothed or polished over the whole surface. They are extremely variable in size, ranging from 2 or 3 inches in length to as much as 14 or 16 inches in length. Axes or adzes were often made of other materials than flint, such as diorite, nephrite, greenstone, basalt, limestone, porphyry, serpentine, jasper, sandstone, and clayslate. Some of the modern savages, as those of New Guinea and the Barbados Islands, &c., make their axes of a large shell, extremely dense in texture. Chisels and gouges of flint are usually polished. They are well-made and effective tools, varying from 4 to 6 or 7 inches in length, and are most common in Scandinavia. Awls and borers are of various forms and sizes, but usually with a flattened shoulder or butt to be held between the finger and thumb. The most curious of these are the flint drills for piercing the 'eyes' of the bone needles found in the French caves. Besides the 'implements' properly so called, because their purpose is apparent from the form and finish that have been given to them, there is a class of 'F. I.' so called because they are artificially shaped, although they are so destitute of indications of destination or design, that it is impossible to suggest any special purpose of practical utility for which they could have been intended. They are usually found associated with remains of animals that are either totally or locally extinct, such as the mammoth, rhinoceros, lion, hyæna, reindeer, Irish elk, &c., and on this account, as well as from their rudeness of form and finish, an extremely high antiquity has been claimed for them.

Flint'shire, a maritime county in N. Wales, bounded on the N. by the Irish Sea, on the E. by the Dee, and on the S. and W. by Denbighshire. F. chiefly consists of uplands, with hills of moderate height, the loftiest point being Moel-y-Famma, 1845 feet, in the S.W. The coast is low, and mostly sandy, but there are rich meadows on the estuary of the Dee. Many rivers, as the Elwy, Terrig, and Wheles, rise in F., but have their course chiefly in other counties. F. belongs mainly to the New Red Sandstone and Carboniferous formations, and has rich measures of coal, which are largely worked, and veins of iron, lead, zinc, calamine, and copper. Corn, barley, and green crops are grown in the plains and vales, and the uplands afford excellent pasture for cows which are noted for the quantity and quality of their milk. The chief industries are mining, metal-working, and agriculture. There are also cotton and woollen manufactures. F. is traversed by Wat's and Offa's dykes. Near Mold the Picts and Scots were defeated by the Britons in 340, and in 796 the Welsh were beaten back by the Saxon invaders. There is a very ancient castle at Caergwyle. Corn crops cover 25,412 acres (oats 13,111), green crops 8011 (potatoes 2434), clover, sainfoin, and grasses in rotation 16,825, and permanent pasture or grass not broken up 75,675 acres. Small fruit is grown over 110 acres, and bare fallow or uncropped arable land accounts for 536. Mountain and heath land cover 6569 acres and these are used for grazing purposes. Nursery grounds are laid out on 6 acres, and 7839 are occupied by woods and plantations. (See also articles CATTLE, HORSE, PIG, SHEEP). The principal towns are Mold (the county town), Flint, Holywell, and St. Asaph. F. returns one member to Parliament. Area 164,051 acres; pop. parl. co. 52,881; ancient co. and adm. co. (each) 77,277; and reg. co. 42,565.

Flint'y Slate, a smooth, hard, brittle, splintery black rock, the result of the metamorphosis of slate or clay by contact with a mass of igneous rock. Rocks of this nature are found in the Lower Silurian of the S. of Scotland: and Lydian stone, used as a touchstone for testing precious metals, is probably of the same origin.

Float'ing Batt'ery, a name given to large vessels or hulks heavily armed and made as far shot-proof as possible. They were not built so as to attain high speed, or to be adapted for general service at sea, their principal use being in sieges, where rapidity of movement was not required. Wooden floating batteries were used against us by the French and Spaniards in the siege of Gibraltar (1779-80), and we employed iron ones—as did also the French—with success during the Russian war. Floating batteries are now superseded by armour-clad steamships, which unite a far greater degree of invulnerability than the others, with a speed such as the fastest cruisers scarcely ever attained.

Floating Islands may be formed either by nature or art, and consist mainly of masses of buoyant spongy soil, held together by the tenacious roots of plants. Portions of river banks are occasionally torn away by floods or swift currents, and carry with them to the ocean trees, reptiles, birds, and even large animals. Such 'straggling plots' are sometimes seen as far as 100 miles from the mouth of the Ganges, and were observed issuing from the Mississippi during the floods of 1874. F. I. have thus doubtless played an important part in the distribution of animal and vegetable life. Natural F. I. occur in great numbers in the marshy lakes bordering the Gulf of Venice. The lake of Gerdau, in Prussia, contains one of the largest in the world, while that in the lake of Kolk, in Osnabruck, is clad with elms. In Derwentwater, Cumberland, there is a small island which sinks below and rises to the surface of the water periodically, like the fabled island of the Cutilian waters. This phenomenon is explained by the island rising only when the Catgill, a stream which here enters the lake, is flooded by rains. The most celebrated artificial F. I. are the *chinampas* of the native Mexicans, and the aquatic gardens of Kashmir. The former sustained small trees and huts and could be propelled about by means of a pole.

Float'stone, a light spongy-like variety of fibrous quartz, capable of floating on water, and occurring as flint incrustations in the limestones of the Paris chalk formations.

Flodd'en, Battle of, was fought on 9th September, 1513, when James IV. of Scotland, who had sided with Louis XII. of France against Henry VIII. of England, was defeated by the Earl of Surrey, at F. Hill, one of the Cheviots, in Northumberland. There were about 30,000 on either side, and the Scots lost 10,000 men, among whom were James and the flower of his nobility. Jean Elliot's exquisite ballad the *Flowers of the Forest* ('I've heard the lilting at our yowe-milking') is a lament for the calamity. The battle is described with more than Homeric fire and brilliancy in the 6th canto of Scott's *Marmion*. See Burton's *History of Scotland*, chap. xxx.

Flogging, in the British army, is mentioned 'as strappadoe for drunkenness on guard' in the articles of war put forth by Charles I. in 1629, by advice of the council of war for the government of the troops in England. In every market there was to be a strappadoe as well as a gibbet. In the codes of 1639 and 1642 ordinary whipping by the provost is distinguished in the list of punishments. These codes also contained what was afterwards called by soldiers the 'devil's articles,' viz., for punishing indefinitely crimes for which no special order had been set down. In 1666 a jurisdiction in offences involving neither life nor limb was given to the then created regimental courts, which had also a power of 'arbitrary correction.' In 1672 'running the gantlet' was added. The Mutiny Act of 12 Anne confers on courts-martial a power to inflict corporal punishments 'for immorality, misbehaviour, or neglect of duty.' The disgraceful Act of 1715 declared every offence to be capital, with a discretion to the court-martial to award such other punishment as they should think proper. In 1812 both Houses of Parliament accepted the principle that for minor offences imprisonment might be inflicted as an alternative for corporal punishment, and the limitation of 300 lashes was introduced. A keen controversy raged down to 1868, when by 31 Vict. c. 14, sec. 22, the power to sentence any soldier to corporal punishment for any offence whatever during time of peace in her Majesty's dominions was abolished. But corporal punishment might be inflicted during active service or on board any ship not in commission for mutiny, insubordination, desertion, drunkenness on duty or on the line of march, disgraceful conduct (including embezzlement, theft, malingering, maiming, or tampering with the eyes), or any breach of the Articles of War, no punishment to exceed fifty lashes, or where punishment was also awarded, twenty-five lashes. This applied only to privates and non-commissioned officers. In carrying out this sentence the culprit was tied to a gun-wheel or a triangle of wood. For this purpose halberds were once used, hence the expression 'bringing a man to the halberds.' The drummers of infantry, and the trumpeters or shoeing smiths of cavalry, were selected for the work. The cat-o'-nine-tails consisted of a drumstick with nine ends of whipcord, 16 inches long, and with three knots each. Steeping the cats in brine had been made the subject of a serious charge, and in the case of Governor Walls (28 *State Trials*), where a rope had been used, there was a conviction for murder. Flogging was totally abolished by the Army Discipline Act, 1881.

The law of F. in the navy during service is contained in the following passage of the Queen's regulations:—'It being requisite for the maintenance of the efficiency, discipline, and even safety of H.M. ships of war, that the power of inflicting corporal punishment, when absolutely necessary, should be continued, such punishment is only to be inflicted under the responsibility and authority of the Captain, who is however to exercise the power vested in him with the greatest discretion and forbearance, compatible with the discipline of the service.' No officer is subject to F., and petty and non-commissioned officers and seamen, marines, and other persons in the First Class for conduct only in case of mutiny. No seaman, marine, or other person in the Second Class for conduct, belonging to a ship, is liable to summary corporal punishment, *i.e.*, flogging (limited to 48 lashes), in time of peace unless he be guilty of mutiny, or using or offering violence to a superior officer, and even then he is not to be flogged if the offence may be sufficiently met by imprisonment and the offender can within seven days be sent to a prison or tried by court martial. Under the Criminal Law Consolidation Acts of 1861 (there are five of them), males under sixteen years of age may be flogged for certain offences; and statute 25 Vict. c. 18, limits the punishment of boys under fourteen years of age to twelve strokes from a birch rod. In Scotland, persons over sixteen cannot be flogged for crimes of violence, &c., but in England robbery with violence and attempting to choke (while intending to commit an indictable offence against the choked) may be punished by flogging, besides the other authorised punishments where the offender is a male. Females cannot be sentenced to be flogged.

Flood, Henry, son of the Chief Justice of the Queen's Bench in Ireland, was born in 1732, was educated at Dublin and Oxford, and in 1759 entered the Irish parliament, where he soon made for himself a name by reason of his eloquence and his energetic action in connection with measures for the good of Ireland. In 1775 he became vice-treasurer of Ireland, but resigned in 1781. Two years later he was returned for Winchester, in the English House of Commons, and in 1785 for Seaford, and fully maintained the reputation of being a logical and eloquent speaker. He was also the author of the *Ode to Fame*, a volume of speeches, and a poem on the death of Frederick Prince of Wales. Died 2nd December, 1791.

Floor'cloth is generally formed of strong canvas oil-painted on both sides. (See LINOLEUM and KAMPTULICON.) The canvas is chiefly woven in Dundee in pieces of great length and width. The manufacture of F. is begun by stretching a piece of canvas containing about 210 or 220 sq. yards upon a vertical open wooden frame, a series of these frames being arranged parallel to each other at a distance of

30 inches with a tiered scaffolding between them, to enable the workmen to reach every part of the canvas. The cloth is washed on both sides with weak size, and then smoothed with pumice. This 'priming' solution preserves the pliability of the cloth by filling up the meshes to the exclusion of the oil-paint, which is next applied in the form of one 'trowel' and one 'brush' colour to the back, and afterwards of three coats of 'trowel' and one coat of 'brush' colour to the face. Each layer of paint, when dry, is rubbed down with pumice. The 'trowel' colour is so called because it is worked over the canvas with a trowel-shaped implement, the thick consistence of the paint not admitting of its being spread with a brush. When thoroughly dry, the painted cloth is transferred to the 'printing-room,' where it is passed over a long narrow table, and a pattern is hand-printed on the face by means of wooden blocks. Each colour has a separate block, the impressions of all producing an appropriate and harmonious design. From two to three months are occupied in the production of good floorcloths. The full-printed cloths are hung up in 'drying-rooms' to mature and season. This measure imparts strength to the cloth and brilliancy to the colours.

Floors in houses, the horizontal partitions between the stories. In the common or 'single-joisted' floor, a series of parallel wooden beams are laid across from wall to wall; these are not less than 8 or 9 inches deep, and 2 inches thick, and commonly more, and are called *joists*. To the top of these the flooring, which consists of narrow planks placed close together, is secured, and underneath them the laths for receiving the plaster of the ceiling are attached. 'Double-joisted' and 'framed' F. are more complex in construction, and are used where for any reason special strength is required, or where the length of the room is very great. The space between the flooring and the ceiling should be filled as far as possible with cement or other substance, as 'deafening.' In this country the flooring is of soft wood, and is most frequently planed tolerably smooth and left in that condition. In most parts of the Continent, where carpets are not so much used as with us, the F. are of hard wood, carefully jointed and kept always polished. The floor thus made looks better certainly than nine-tenths of the carpets used in this country. It is both clean, convenient, and economical to stain and varnish the edge of a soft-wood floor for a distance of about 2 feet 6 inches from the wall all round, and to put a border round the carpet, making it cover only as much of the floor as is unstained. This method can be used in any house floored in the ordinary way, by having the small spaces too often left between the planks stopped first with brown putty.

Flo'ra, the goddess of flowers and spring, was worshipped at Rome from the very earliest times. Her festival, the Floralia, lasted five days, from 28th April to 1st May, and was celebrated with great licentiousness. The later Romans identified F. and Chloris, the Greek goddess of flowers. In botany the word denotes the vegetable kingdom. See Fauna.

Flor'ence or **Firenze** (Lat. *Florentia*, 'the flourishing'; Ital. *Fiorenza*, now *Firenze*, surnamed *la bella*), one of the largest and fairest cities of Italy, capital of the province of the same name (Firenze), is built on both sides of the Arno, but chiefly on the N. bank, 50 miles from the sea, and is connected by rail with Bologna and Rome. Its environs are singularly beautiful. It lies in the leafy valley of the Arno, in a gently undulating country, amid low hills covered with vineyards and terrace gardens, with white villas and old towers embosomed in groves of olives, cypresses, and mulberries, while to the N. the Apennines rise to a height of 3,000 feet. The central and oldest part of F. is a maze of narrow, gloomy streets, where the massive castellated palaces of the nobles, used as fortresses during the Middle Ages, may still be seen. The Borghi, or outer quarters, which intervene between this central part and the old walls, are more spacious and regular; and beyond the walls lie the modern suburbs, consisting almost wholly of villas set amongst gardens. F. was in 1864-70 much changed, and since then several other improvements have been carried out. A new suburb has been built on the E. of the city, with handsome squares and boulevards, and the old quarters have been pierced by wide streets. The Arno, now confined to a channel 100 feet wide, is lined by broad quays known as the Lung Arno, which form a fine promenade, with a view of the sylvan Valdarno at one end, and of the Vallombrosan hills at the other. The river is spanned by several fine bridges, of which the Ponte alle Grazie is the oldest, having been built in 1235 (restored 1835). The Ponte Vecchio, still covered with quaint shops, dates from 1362. The walls are dismantled of the seventy or more towers which once crowned them, but the old gates are extant, the most interesting being the Porta Romana, Porta S. Miniata, Porta S. Gallo, and Porta alla Croce, built in 1284, the two last displaying frescoes by Ghirlandajo. F. has above twenty squares, of which the chief is the Piazza della Signoria, once the forum of the Florentine commonwealth, and still the great seat of trade. It contains a large fountain with bronze statues by Gian of Bologna. F. is rich in graceful and imposing buildings, in picturesque and historical piles. The Duomo, or cathedral, which stands near the centre of the city, was begun by Arnolfo di Lapo in 1294, was continued by Giotto, and was finished by Brunelleschi in 1436. The dome is 384 feet high, and the walls are cased with marble. By the side of the Duomo Giotto's campanile, or bell-tower, rises to a height of 292 feet. It is covered with delicately-tinted marbles and Gothic traceries, and according to Ruskin is the one building which unites in the highest degree the characteristics of beauty and power. The church of Santa Croce, 'the Westminster Abbey of Italy,' possesses eleven chapels and the tombs of Michael Angelo, Alfieri, and Macchiavelli, while the church of San Lorenzo contains the tomb of the Medici and the statues of Giuliano and Lorenzo de' Medici by Michael Angelo. The Palazzo Vecchia or Palazzo della Signoria, built in 1285 by Arnolfo, is a square turreted pile, and was once the seat of the republic's magistrates. It has a lofty tower with the great bell which formerly called out the citizens. The Palazzo degli Uffizi possesses a library of 150,000 vols. and 12,000 MSS., and an unsurpassed collection of sculptures and paintings, amid which are the Venus de' Medici and the famed group of Niobe and her children. The Palazzo Pitti, begun by Brunelleschi, and the residence of the King of Italy when he is at F., has a library of 70,000 vols. and a magnificent collection of paintings. Near the Pitti Palace, and on the summit of a hill S. of the Arno, are the Boboli Gardens, with statued avenues, terraced walks, fine fountains, and trees cut into formal shapes. The Bargello, built in 1255 as the abode of the Podestà, and known as the Palazzo di Giustizia, but for centuries used as the public prison, has been of late carefully restored and transformed into a museum for Tuscan antiquities. It has seven great halls and a richly-carved marble staircase. The church of Or San Michele is one of the finest Florentine relics. It is adorned with statues by Ghiberti, Donatello, and Gian of Bologna, which stand in niches of white marble carved into fanciful arabesques and inlaid with gold mosaic. There are many other palaces and churches and several theatres and hospitals. The commercial greatness of F. has departed; the silk, velvet, and woollen manufactures have declined, and trade is now mostly in mosaics, jewellery, porcelain, and works of art, though carpets and straw hats are still made. F. has been compared to Athens for the turbulence, intellectual brightness, and keen political sympathies of its inhabitants, for its firm democratic leanings, and for its splendour as a home of literature and art. It was the centre of the Renaissance in Italy, and the focus of Italian culture; it gave birth to the modern literary dialect of the Italian language, produced the earliest school of political historians since the days of ancient Greece, and numbered among its sons several of the greatest names in the history of painting, sculpture, and architecture. See Renaissance, Italian Literature, and Italian Art.

F. was founded by the Romans in the 1st c. B.C., was pillaged in the dark ages by the barbarians, and was afterwards occupied by the Lombards. Karl the Great appointed a duke, afterwards called a count, over F., with officers under him chosen partly by the people, a government which seems to have been the germ of the Florentine commonwealth. The emperors, especially Otho the Great, favoured the city, which in the 10th c. had conquered several neighbouring places. F. was ruled by twelve *Angiani*, acting along with a foreign Podestà, and no distinction was made between plebeians and nobles, until, between 1282 and 1292, a mercantile commonwealth was established. It was decreed that no one could bear office who did not belong to the *Arti* or commercial guilds, and the nobles were forbidden to share in the government, which was administered by eight Priors and the Gonfalonier of Justice. These held office for two months. About 1300 party strife broke out between the Guelphs, known as the *Neri* ('blacks'), and the Ghibellines or *Bianchi* ('whites'), the latter, among whom was Dante, being in the end banished. In 1323 the constitution was changed, and Guelph citizens above 30 were alone declared eligible for the chief magistracies, and were chosen by lot. During the 14th c. a new aristocracy grew up and the Medici came into importance. In the beginning of the 15th c. the Medici dynasty was founded by Giovanni de' Medici (died 1428), who was succeeded by Cosmo; and Cosmo's grandson Lorenzo in 1480 overthrew the old democratic constitution in place of a Council of Seventy, through which he controlled the state. In 1494 Pietro Medici was banished, and Savonarola founded a theocratic commonwealth, which ended in 1498; then the old republican government was restored under Soderini until 1512, when the Medici returned to power. A free commonwealth again existed from 1527 to 1530, when the Medici despotism was forced upon the city by the Emperor Karl V. Up to this time the Medici had ruled as commercial tyrants without princely titles, but in 1532 Alessandro de' Medici was made hereditary president, and Cosmo, his successor, was declared Grand Duke of Tuscany in 1569. On the extinction of the Tuscan ducal line in 1737 F. became the appanage of the house of Lorraine, under whom, except during the episode of Napoleon's kingdom of Etruria, it remained until 1860, when Tuscany was united with the kingdom of Italy. In 1864 F. succeeded Turin as capital of Italy, but was superseded by Rome in 1870. In history F. is remarkable for her general adherence to the Guelphic party, for the instability of her government as contrasted with the permanence of the Venetian rule, for the bright, variable political activity of her citizens, and for surpassing every other Italian city in her interest in the welfare of all Italy. Area of province 2265 sq. miles; pop. town 168,407; province 820,454.

Florence of Worcester, a monkish chronicler, belonging to Worcester monastery, where he died 7th July, 1118. He wrote a chronicle from the Creation to 1117, compiled chiefly from the *English Chronicle* and the work of Marianus Scotus, with additions from Bede, the so-called 'Asser,' and the Lives of the Saints. His chronicle deals mainly with English history, but also notices events abroad. It was brought down to 1141 by others of the brethren.

Flo'res (Port. 'flowers').—1. The most westerly island of the Azores, in lat. 39° 25′ N., and long. 31° 12′ W. It is very fertile, and has a pop. of 8,838. The chief town is Santa Cruz.—2. The largest island of the chain extending E. from Java to Timor, lies 200 miles S. of Celebes. It is 200 miles long and 35 broad, is in great part hilly, and has several lofty volcanic peaks on its S. side. The exports are sandal-wood, beeswax, and rice. There are Malay settlements on the coast, but the natives are of Nigritic race.—3. An islet of Uruguay, in the Plata, 20 miles below Monte Video.

Flor'iculture, or **Flower-Cultivation,** the art of cultivating flowers for the sake of their beauty, odour, and uses, has been practised from the most ancient times. In ancient history special reference is frequently made to floral decorations and to the selection of flowers for various purposes; while in modern times, not only has the art of gardening become very highly developed, but from a knowledge of the physiology of plant-life, florists are enabled to cultivate flowers under much more favourable auspices than formerly. The art of landscape-gardening has in fact become of late years highly specialised. In great towns and cities especially, flower-growing has been much facilitated by the invention of the *Wardian case*, a closely-glazed case invented by N. B. Ward. It consists of a strong box or trough to contain earth, which is placed over a substratum of gravel and broken bricks. The soil is well watered, and over the box a glass roof of tight-fitting nature is placed, this glass roof possessing a door or aperture permitting the removal of dead leaves, &c. By means of this principle of isolating, as it were, plant-life from the surrounding atmosphere, and supplying delicate or exotic forms with the necessary conditions for growth, many plants of rare nature can be successfully grown even in a very smoky atmosphere. The cultivation of flowers for commercial purposes may be said to form the practical application of the art of F. Thus the cultivation of Lavender (q.v.) assumes a high importance from the uses of that plant in the manufacture of perfumes. At Mitcham in Surrey vast quantities of lavender are grown. Otto or attar of roses, valued in some cases at five guineas per oz., also exemplifies the extent to which the successful results of F. may be carried.

Flor'ida, the most southern of the United States of America, included chiefly in the bold peninsula projecting from the S.E. angle of the country, is bounded on the E. by the Atlantic, on the W. and S. by the Gulf of Mexico, and on the N. by the states of Georgia and Alabama. The peninsular portion is 90 miles broad and 370 miles long. The coast-line is over 1150 miles in extent, and among its numerous harbours some of the chief are Pensacola, St. Mary's, Cedar Keys, Tampa, Fernandina, Biscayne Bay, Sarasota, Charlotte, Key West, St. Augustine, and Jacksonville. The capital is Tallahassee (pop. 2934), but there are much larger towns, such as Key West (18,080), Jacksonville (17,201), and Pensacola (11,750). From Cape F., near the southern extremity of the peninsula, a great series of reefs or keys sweep round to the S. and W., and end in a group of sandbanks and islets called *tortugas*. The chief of the keys are Key Largo and Key West, on the latter of which the important city and naval station of the same name is placed. The *surface* is level, the highest elevation being a ridge 180 feet above sea-level, extending from Fernandina on the E. to Cedar Keys on the W. coast, and traversed by railway. Streams, lagoons, and marshes abound all over the country. The chief rivers are the St. John's, Withlacoochee, Kissimmee, St. Mary's, Appalachicola, Chattahoochee, and the Suwannee. In southern F. the land seldom rises to more than 6 feet above the level of the tide. The soil is usually a light sandy loam, with a substratum of clay, and is of all qualities from the sandy pine barrens to the swamp land of tropical productiveness. Nearly all the grains and fruits of temperate regions may be grown in the N., semi-tropical fruits are profitably cultivated in the eastern and central districts, tropical fruits in the S. Raising cotton and sugar-cane, for which the soil and climate of F. are especially suitable, are growing industries. The forests consist of yellow pine, live oak, hickory, magnolia, mahogany, satin-wood, &c. Though in the same latitude as the Sahara Desert and S. China, the climate of F., tempered by cool winds from the seas surrounding it, which blow from sunrise to sunset, is delightful during the greater part of the year, and in this connection F. is becoming to the northern states of America what southern France and Italy are to Europe—a national sanatorium, and a favourite place of resort for those suffering from pulmonary diseases. The cultivation and export of oranges, lemons, and citrons is the chief industry. Considerable quantities of cotton, Indian-corn, potatoes, sweet potatoes, sugar, and tobacco are grown. In 1881 the cotton production was 54,997 bales. The Indian-corn crop averages over 3,000,000 bushels, of Irish potatoes 13,000 bushels, of sweet potatoes 1,037,000 bushels, of sugar 1300 hogsheads, of molasses 500,000 gallons, of tobacco 200,000 pounds. It has been stated that F. may at no distant date grow fruit for half the world, if she can only obtain sufficiency of capital and labour. Debt of the state, less sinking fund, $1,031,912. *History.*—Poncè de Leon, in search of an El Dorado that contained also the Fountain of Life, landed here in 1513, and gave the country its present name—the feast of flowers, so called from its having been discovered on Easter-day (Span. *Pasqua Florida*, 'feast of flowers'). It was settled by the Spaniards in 1565, ceded to Britain in 1763, re-ceded to Spain in 1784, sold to the United States in 1819, and constituted a state of the Union in 1845. In 1861 F. joined the Southern Confederacy, and was the scene of many bloody conflicts until 1865. In 1868 the state was readmitted into the Union. Area 54,240 sq. miles; pop. 391,422, of whom there are 166,180 persons of African descent, 108 Chinese, 14 Japanese, and 171 civilised Indians.

Florida-Blan'ca, Don Josefo Moñino, Count of, a Spanish statesman, born at Murcia in 1728. He studied law, became ambassador at Rome, where he ably composed many differences between Spain and the Pope, and was a chief agent in the election of Pius VI. In 1777 Charles III. made him prime minister, in which office he promoted trade and science, improved the roads and beautified the cities of Spain, and allayed a dispute with Portugal. He united Spain with Russia and Prussia in an armed neutrality, of which the aim was to cripple England, but his foreign policy ended in failure. During his administration Algiers was bombarded, which checked piracy, many heavy dues were removed, and great judicial reforms were effected. F. created many powerful enemies, and in 1792 was imprisoned in the castle of Pampeluna. After several years' confinement, he was permitted to return to Murcia, where he lived in retirement until 1808, when he was called to preside over the central junta during the war with Napoleon. He died at Seville, 20th November, 1808. F. wrote several treatises on jurisprudence.

Flor'idæ. See CERAMIACEÆ.

Florida Gulf, between the peninsula of Florida and the Bahamas, is practically the local name applied to that reach of the Gulf Stream which skirts the S.W. coast of Florida. See CURRENTS, OCEAN.

Florida Keys, a crescent-shaped group of islands along the S. coast of Florida. The gulf stream does not touch them. Cayo Largo (Long Key) is the most extensive, and has an area of about 25 sq. miles; and Key West is the next in magnitude, but most of them are quite small islets. They are of a coral formation and scarcely rise above the spring tide level. Very hard wood is grown upon them.

Florid'ia, a town of Sicily, province of Siracusa, near the Alfeo, 7 miles W. of Syracuse. It has some trade in grain, wine, and olives. Pop. 10,807.

Flor'in, at first the name of a gold coin, so called either because it was made at Florence, or because on its reverse side there was a lily (Lat. *flos*, 'a flower'). The modern English coin so designated is of silver, and of the value of 2s.

Flor'ists' Flowers. These flowers are so named from having been made the subjects of special attention by the practisers of Floriculture (q.v.). The cultivation of roses, dahlias, tulips, fuchsias, hyacinths, and many other flowers, exemplifies the results of the florist's art. The liability of many flowers when cultivated to *sport—i.e.*, to produce varieties—and the knowledge that by fertilising together flowers of different species, varieties can be produced in some cases almost at will, form two facts of great importance to florists. The fertilisation of the seeds of one species by the pollen of a different species tends to produce a union, in the hybrid progeny, of the characters of the parent-species. And hence the colours of flowers and other characters can be manipulated often with great freedom. *Double flowers* result from the conversion of the stamen and pistil into whorls of flower leaves—this process resulting in the sterility of these flowers. The Dutch have long been famous for their cultivation of flowers, particularly Tulips (q.v.). In 1636-37 a 'tulip-mania' seized Holland, and fabulous prices were given for rare varieties and bulbs. In S. Holland the cultivation of roses is also carried on with vigour, and in Britain, dahlias, hollyhocks, fuchsias, and other flowers, too numerous to mention here, are successfully grown.

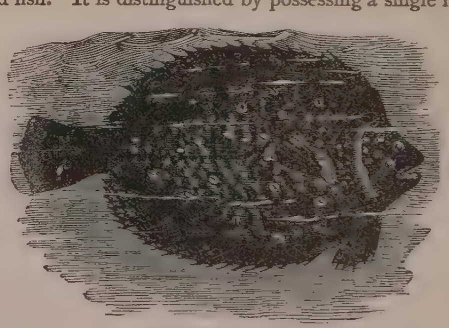
Flo'rus, L. Annæ'us, or more probably **Julius,** the reputed author of a succinct but over-rhetorical history, *Epitome Rerum Romanarum*, composed most probably in the reign of Augustus. It consists of two books, the first dealing with the foreign wars of Rome, the second with civil strifes, and ending at A.D. 20.

Flo'tant (Fr. 'floating'), an heraldic phrase applied to an unfurled flag.

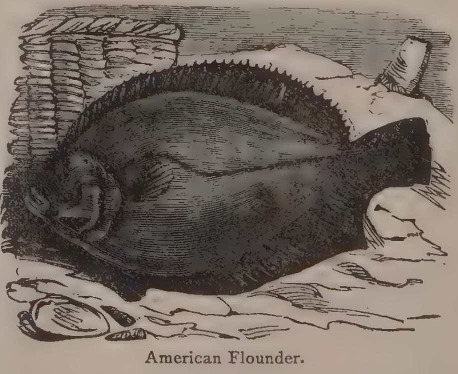
Flo'tow, Friedrich von, a German composer, born at Teutendorf, in Mecklenburg-Schwerin, 27th April, 1812. He received his musical education in Paris, where also his first successful opera, *Le Naufrage de la Méduse*, was produced in 1839. His compositions are all operatic; they are pleasant and melodious, and in many ways more like the work of a musician than those of his Italian and French contemporaries. While extremely popular, however, both in Germany and France, they are not yet, with the exception of *Martha*, so much known in this country as they deserve to be. The principal are *Stradella, Die Grossfürstin, Rübezahl, Indra, Albin, Hilan, and L'Ombri.* In 1863 F. settled at Paris, where he remained till his death, 24th January, 1883.

Flot'sam is a term of English law denoting goods floating in the sea, or goods which have been cast on shore by the sea. Where the owners are not known, F. goes to the Crown or lord of the manor. When the owners are known, they have a year and a day to claim their goods. See DERELICT, JETSAM, and JETTISON.

Floun'der, a species of *Pleuronectidæ* or flatfishes, common on the coasts of Britain and America, and esteemed as a food fish. It is distinguished by possessing a single row of teeth, the dorsal fin commencing over the eye, and the tail fin being distinct. The common F. attains a length of 10 or more inches, and a maximum weight of 5 or 6 lbs. Smaller specimens, however, are more frequently met with. The eyes are on the right side of the body, this being the upper



English Flounder.



American Flounder.

side of the animal, which swims and lies on the left side. Its colour is brown. The dab, a member of the same species, is nearly allied to the F. The common American F. is from 10 to 22 inches long, and is excellent eating in summer and autumn. The colour varies from slate to blackish-brown. The scales are small and arranged smoothly along the body.

Flour, the grain of wheat or other cereals finely ground for human food. The term is also applied to many finely-powdered substances.

Flou'rens, Marie Jean Pierre, a French scientific writer, was born at Maureilhan, Hérault, 15th April, 1794. He devoted himself from an early age to scientific study, at seventeen delivered a course of lectures on 'The Physiological Theory of Sensations,' and at nineteen obtained the degree of Doctor of Medicine, after which he went to Paris, where he made the acquaintance of St. Hilaire, Chaptal, the Cuviers, and other men of science. Admitted a member of the Académie des Sciences in 1828, he succeeded in 1832 to the professorship of natural history in the Jardin du Roi, and the following year became Perpetual Secretary of the Académie des Sciences. F. was a very voluminous writer, and from 1841 to 1851 published a number of books giving in a comprehensive form and in a singularly lucid style the 'history and philosophy' of several branches of science. F., who had been a deputy to the French Chamber for Béziers, was made in 1840 a Peer of France, and in 1864 member of the Municipal Council of Paris. He died 6th December, 1867.—**Gustave F.,** son of the above, and better known as a revolutionist than as a *savant*, was born 4th August, 1838. In 1863 he filled his father's chair in the Collége de France, published (1865) *Science de l'Homme*, and aided in the preparation of a *Grand Dictionnaire du XIX. Siècle*. From 1866-68 he took part in the Cretan insurrection, about which he wrote a book. On his return he threw himself into conspiracies against the Second Empire, aided the celebrated Rochefort in editing the *Marseillaise*, was wounded in a duel with the Bonapartist Paul de Cassagnac, and on being sentenced in 1870 to three years' imprisonment, fled to England. After the fall of the Second Empire he became commander of a regiment under the Commune, and was killed 3rd April, 1871.

Flour-Mite, a species of *Acaridæ* or mites which belong to the spider class (*Arachnida*). They exist among flour, and resemble in form the cheese-mite. The body is oval, has eight legs, and is covered with bristles. The female flour-mites are larger than the males.

Flour, St. (the ancient *Sanctus Florus*, surnamed *La Noire*), a town of France, department of Cantal, 34 miles E.N.E. of Aurillac. It stands on a basaltic highland, and is built almost entirely of volcanic *débris*. Its chief buildings are the cathedral (15th c.), the church of St. Vincent, and the corn-market. F. has manufactures of copper utensils, and trade in cattle and corn. Pop. town (which is divided into N. and S. St. F.) 5308; arrond. 51,716.

Flower (from Fr. *fleur*, Lat. *flos, floris*), the name given to the conspicuous series of organs found in higher plants, the ultimate function of which is *reproductive* in nature, and serves to mature and produce *seeds*. A perfect F. consists of four *whorls*, or concentric series of organs. Externally we find (1) the *calyx* (usually green, but sometimes coloured), composed of certain leaves named *sepals*; (2) within the calyx, the *corolla*, or showy part of the F. composed of leaves named *petals*, and coloured to attract insects to the F., for the purpose of fertilising the pistil by the conveyance of the pollen or matter of the stamens; (3) the *stamens*, forming the third whorl and existing each as a *filament* bearing a head or *anther*, consisting of two lobes, within which the *pollen*, a yellow powder necessary for fertilising the seeds, is produced; (4) the *pistil*, which is the central whorl of the F., and is composed of one or more folded leaves named *carpels*. Each carpel consists of a lower portion (the *ovary*, containing the *ovules* or *seeds*), of a neck (the *style*), and of a little head surmounting the neck, and named the *stigma*. The stigma and style may be wanting. The stigma is borne directly on the ovary (as in the poppy) when the style is wanting. The calyx and corolla are collectively named the *floral envelopes*; while the stamens and pistil are together named the *essential organs*, because they are necessary for the production of seed. Every part of the F. is a leaf more or less modified. The leaf-type of the F. may be demonstrated in cases of abnormal flowering, as in *double flowers*, where the stamens and pistil are represented by floral leaves. Conspicuous flowers are only met with in higher plants, which are hence named *phanerogamous*. In ferns, mosses, and lower plants, the reproductive organs are not conspicuous, and such plants are hence named *cryptogamous*. The F. is usually borne on a *peduncle* or F.-stalk. Where no F.-stalk is developed, flowers are said to be *sessile*. Thus in a daisy numerous sessile flowers are borne on a common receptacle, and form a F.-head or *capitulum*. When all four whorls of the F. are present, the F. is *complete*. It is *incomplete* if one or more are absent. When (as in lilies, tulips, &c.) the calyx cannot be distinguished from the corolla, or when one whorl only is present, the floral envelopes receive the name of *perianth*. A F. with calyx and corolla is said to be *dichlamydeous*; with one envelope only, *monochlamydeous*; and with no true calyx or corolla, *achlamydeous*. Flowers are *irregular* when one part of the calyx or corolla exceeds in size the other parts—as in the corolla of dead-nettle; and *regular*, when all the parts are of equal size—as in the buttercup. A F. is *symmetrical* when its parts exist in similar numbers or in multiples of one another. When flowers depart from the ordinary type of floral structure or arrangement, their modifications are due—(1) to the *absence* or *suppression* of one or more whorls; (2) to the *form* of the whorls; (3) to the *separation* or *union* of parts of whorls; (4) to the *parts* of one whorl being united to the adjacent whorl on either side; and (5) to the *position* of each whorl on the floral receptacle. Flowers are *bisexual* when each has both stamens and pistil. They are *unisexual* when each F. has one series of essential organs (stamens or pistil) only. Flowers are called *monœcious* when staminate or stamen-bearing flowers are situated on the same *plant* with pistillate flowers; and *diœcious* when staminate flowers are situated on one plant and pistillate flowers on a distinct plant. The *arrangement* of flowers on the flowering-axis is named *inflorescence*. Inflorescence is determined by the manner in which flowers open. Thus when the centre F. opens first, and the external flowers open later, the inflorescence is said to be *centrifugal* or definite; such a mode of F.-expansion is seen in buttercup, chickweed, sweet-william, &c. In wallflower, foxglove, &c., the inflorescence is *centripetal* or *indefinite*, the flowers furthest from the axis opening first. The most common arrangements of inflorescence are—(1) the *spike*, as seen in plantain, where numerous sessile flowers are arranged on a common axis; (2) the *raceme* (as in red currant, foxglove, &c.), which is simply a spike with *stalked* flowers; (3) the *capitulum* or *head* (as in daisy, clover, &c.), where sessile flowers are arranged on a common receptacle; (4) *panicle* (as in oat, horse-chestnut, &c.), which is a compound raceme, each secondary F.-stalk or pedicel again dividing; (5) the *umbel* (as in cowslip, carrot, hemlock, &c.), where the pedicels or secondary F.-stalks spring from a common point, and bring the flowers to the same level; (6) the *corymb*, where the flowers reach the same level, but where the pedicels do not spring from the same point (as in elder and hawthorn). Flowers and F.-buds spring from modified leaves named *bracts*, those of the secondary F.-stalks being termed *bractlets*. Where a circle of bracts surrounds a F.-head (as in daisy), the circle is named an *involucre*. The coloration of flowers, their physiology as concerned with fertilisation of the seed and with plant reproduction generally, and many other points, will be found treated of in other articles relating to botanical subjects.

Flowers, Artifi'cial. The art of imitating the floral beauties of nature with varied materials is extensively practised in France and Italy. The chief seat of the art is Paris, and its productions are noted for great artistic beauty. Fine cambric is mostly used for petals, and taffeta for leaves; but velvet, gauze, silk and crape are also in requisition. Stamens are represented with slender wire or stiffened silk threads, and stems are formed of stout copper wire. Veins, folds, and the peculiar markings of leaves are imitated by means of 'goffering' implements. Dyes for tinting are specially prepared. Most manufactories employ females, and produce only a component part of a flower, the parts being collected and grouped together by those who possess an intimate acquaintance with the natural objects. A. F. are much used for head-wreaths, dress-trimmings, bouquets, and table decorations. Great Britain carries on a large and annually-expanding import trade in A. F., chiefly with France. The value of the imports in 1894 were £375,366, of which £335,906 was the value of the import from France, £35,274 from Holland, £3326 from Belgium, £854 from Germany, and £6 from Canada. There would appear to be no export trade in A. F. Wax-flower making, which is almost exclusively practised in Great Britain, is quite a distinct art from the foregoing. (See WAX FLOWERS.) Other materials of the most diverse nature are employed in different countries for fabricating A. F. Feathers are widely used; the Austrians and Swiss use straw, the Brazilians gaudy insects' wings and fish-scales, and the natives of the Bahamas and Mauritius delicate sea-shells.

Flue. See CHIMNEY.

Flu'ids (from Lat. *fluo*, 'I flow') are bodies which yield without resistance to any given pressure, however small, unless they be supported by pressures in other directions. They thus embrace what are usually termed liquids and gases, and differ in this particular of non-resistance from solids, which comprehend all other known forms of matter. F., however, as we have them in nature, do not completely fulfil this condition. The *perfect* ideal fluid is not known; for in all viscosity, or what is termed fluid-friction, exists, in virtue of which work must be done to alter the relative positions of the component particles. As this viscosity gets greater and greater, the liquid fluid approaches more nearly the conditions of a plastic solid, so that in certain instances it is impossible to say whether a given specimen of matter is a solid or a liquid. See GAS, LIQUID, SOLIDS.

Fluke, the name given to various species of parasitic animals belonging to the order *Trematoda* of the class *Scolecida* (q.v.). The *Trematoda* are nearly allied to the *Tæniada*, or the more familiar tapeworms. The flukes are sometimes called *suctorial worms*, from the fact that (as implied by the name *Trematoda*) they have one or more sucker-like pores whereby they adhere to the tissues of their hosts. The flukes are found as parasites and in a mature state in birds, fishes, and other *Vertebrata*. A very familiar form is the *Distoma* or *Fasciola hepaticum* or common liver F., which inhabits the liver and biliary ducts of the sheep, and when present in numbers produces the disease in that animal known to veterinarians as 'Rot' (q.v.). In the common F. the characters of the *Trematoda* may be conveniently studied. In all the flukes, with a single exception, a digestive system is present, although no true perivisceral or body cavity is developed. The digestive system is usually of branching shape, and opens externally by a single aperture only, which therefore serves both as mouth and vent. This opening is situated within the front or anterior sucker. The *sexes* in flukes are united in one and the same individual, and a *water-vascular system* is developed. The common F. attains an average length of an inch or more, and has a body of an oval and flattened conformation. The hinder sucker is not perforated, and between the two suckers the *generative pore* is placed. The water-vascular system itself opens externally by a small aperture. The nervous system exists in the form of a ring of nerve-matter surrounding the gullet. The flukes pass through a complicated development. The young flukes appear to pass into water and gain access to the bodies of such forms as fresh-water snails. In this situation they develop into peculiar bodies called *Cercariæ* and *Cercaria-cysts*, each of which consists of a head extremity and a tail. In some cases the *Cercariæ* appear to produce other *Cercariæ* like themselves. These latter, after some further changes, escape into the water, and gain access to the bodies of sheep along with the water used for drinking. The flukes are not common parasites in man, although occasionally they are found in the human liver and its large veins. *D. lanceolatum* is another familiar species; and an Egyptian one, *D. hæmatobium*, occurs more frequently in man, and is dangerous to human life. An allied genus is *Diplostomum*, which occurs in numbers in the eyes of perches, and other fresh-water fishes.

Fluores'cence, an optical phenomenon observed in certain substances (solution of sulphate of quinine, tincture of turmeric, uranium glass, &c.), which emit a diffused blue or green light when placed in the path of dark actinic rays of high refrangibility. Professor Stokes explains it as due to the degradation of the highly refrangible actinic rays into luminous rays of less refrangibility. It suggests a method for investigating the absorption lines of the ultra violet rays of the spectrum, and is further a beautiful example of dissipation of Energy (q.v.) without the performance of useful work.

Flu'orine is classed amongst the elementary substances (see ELEMENTS, CHEMICAL). Its existence is surmised from the analogies existing between its compounds and those of chlorine, bromine, and iodine. It is, therefore, ranked with these substances, and they are called collectively the *haloids*, or salt-producers. F. occurs most abundantly combined with the metal calcium, as fluoride of calcium or fluor spar, and from this substance all compounds of F. are obtained. The only one of these of any practical importance is hydrofluoric acid, a compound of hydrogen and F., employed to etch glass. To prepare it, powdered fluor spar is heated with sulphuric acid in a leaden retort, when the gaseous hydrofluoric acid is disengaged, and may be used in this state, or conducted into water contained in leaden vessels, in which it is abundantly soluble. Solution of hydrofluoric acid must be preserved in leaden or gutta-percha vessels, as it attacks all others. The atomic weight of F. is 17, and the symbol for its atom is F.

Fluor'otype, a photographic process published in 1844 by R. Hunt. Paper is sensitised by means of a solution of bromide of potassium and fluoride of sodium, and afterwards with nitrate of silver. In developing, protosulphate of iron and weak hydrochloric acid are used; and in fixing, hyposulphite of soda is had recourse to.

Flu'or Spar, or **Derbyshire Spar,** a mineral of frequent occurrence in Derbyshire and Saxony, crystallizes in the monometric system, and is usually found in veins, often as a gangue of galena and other ores, in granite, gneiss, mica-slate, clay-slate, limestone, &c. It is the fluoride of calcium, is commonly greenish, violet blue, or topaz yellow in colour, though also found colourless, rose, crimson, or brown. It is transparent or translucent, is brittle, and of degree 4 in hardness. It is used as a flux for reducing metallic ores, and when heated with sulphuric acid yields hydrofluoric acid.

Flush, a nautical term applied to a ship's deck when it stretches from the bows to the stern in a uniform level, instead of curving upwards fore and aft.

Flush'ing (Dutch, *Vliessingen*, Fr. *Flessingue*, the town on the 'vliess' or 'channel' of the Scheldt), a fortified seaport of the Netherlands, province of Zeeland, on the island of Walcheren, at the mouth of the Western Scheldt, 4 miles S. of Middelburg and 35 W. by S. of Bergen-op-Zoom by railway. It is one of the strongest maritime forts in the Netherlands, commanding the entrance to the Scheldt, and has large harbours, dry docks, good roads, dockyards, arsenals, magazines, &c. There is a considerable Indian trade, besides active fisheries, and numerous regular steam-lines. Opposite F. is the fort of Breskens. F. was the first town that declared against the Spaniards in 1572. It was pledged by the Prince of Orange to Queen Elizabeth in 1585, and remained with the English till 1616. At the beginning of the 19th c. it was taken by the French, and was stormed and captured by the English under Chatham in 1809. In the same year it again fell to the French, who held it till 1814. Pop. 13,634.

Flus'træ, or **Sea-Mats,** a genus of *Polyzoa* (q.v.) or *Bryozoa* (q.v.). They are frequently cast ashore in great quantities on the English coasts, and present the appearance of masses of pale-brown seaweed. When microscopically examined they are seen to consist of a colony of animal forms, each member of the colony or *polypide* being enclosed in a little cell. The cells exist on both sides of the structure, and their tough outer wall or *ectocyst* remains, after the delicate living parts of the organisms have disappeared. Each little member of the colony possesses a mouth, surrounded by retractile tentacles, a digestive system, and male and female generative organs. The colony springs from a single egg, and is produced by a process of continuous *gemmation* or *budding*. The tentacles of *Flustræ* are arranged in an *infundibulate* or funnel-shaped manner. Hence *Flustræ* are included among the Infundibulate *Polyzoa* or *Gymnolæmata*.

Flute (Old Fr. *flaüte*, from *flaüter*, and that from Lat. *flatare*, 'to blow'), a wind instrument of ancient origin. It remained for a long time a very defective instrument, but recent improvements (especially those of Boehm) in the size and position of the holes, and in the fingering mechanism generally, have removed most of its imperfections. The natural scale of the concert F. is that of D major, and its compass is nearly three octaves. It is sometimes called a 'C' F. because its lowest note is C. The *piccolo*, or octave F., has nearly the same range as the concert F., but an octave higher. The sounds of the F. are produced by the vibration of the column of air in the tube, the length of that column being determined by the fingering. They are very nearly Simple Tones (q.v.), and therefore somewhat wanting in richness.

Flute, in classical architecture, is a vertical channel or hollow moulding on the shafts of columns. In a horizontal section of a fluted Doric column, the flutes, twenty in number, are segmental concaves, and sharply intersect each other. In Doric, also, the F. is not terminated before reaching the base and capital, as in the other orders. The Tuscan is the only column that is never fluted; the Ionic, Corinthian, and Composite have each twenty-four flutes. In Romanesque the F. was bent from the perpendicular into curved and twining forms. See CABLING.

Flute'work, a general name given to those stops in organs in which the sound is not produced or qualified by the vibrations of a metal tongue or *reed*.

Flux (Lat. *fluxus*, from *fluo*, 'I flow'), a substance easily fusible added to assist the fusion of refractory materials. Limestone, fluor spar, borax, nitre, sal-ammoniac, common salt, crude tartar, and glass are used as fluxes. *Black F.* is used in the reduction of metallic ores. It is formed of two parts of tartar to one of nitre, mixed in small quantities in a red-hot crucible. *White* or *refining F.* is composed of equal parts of the same ingredients.

Flux (Lat. *fluxus*, from *fluo*, 'I flow'), an extraordinary issue or evacuation, generally from a mucous membrane. Formerly the term was applied to a variety of diseases, such as diarrhœa, dysentery, cholera, bilious attacks, &c., but it is now seldom used. Dysentery was long known as *bloody F.*

Flux'ions, the mathematical method invented by Newton which corresponds to our modern Calculus (q.v.). It is founded upon the kinematical considerations of the motion of a point, a manner of procedure fundamentally identical with that of *limits*, which is now generally recognised as the only true logical method of establishing the first principles of the differential and integral calculus. The *fluxion* of x was written $\dot{x}$, and corresponds to $\frac{dx}{dt}$, the differential coefficient of x with respect to time; $\ddot{x}$ corresponds to $\frac{d^2x}{dt^2}$, and so on. The notation, though now superseded in investigations in pure mathematics, is yet very convenient in many physical problems, where time is the only independent variable. $\dot{x}$ was the *fluxion* of x, and x was the *fluent* of $\dot{x}$; and the integral $\int z\,dx$ was written by Newton $\boxed{z\dot{x}}$ and called the fluent of z.

Fly, a name given popularly to many insects, but zoologically restricted to members of the order *Diptera* (q.v.), or flies in which only two wings—the front pair—are developed, whilst the metamorphosis is perfect, and the mouth suctorial.

Flycatcher, the name given to a large family (*Muscicapidæ*) of Insessorial birds belonging to the section *Dentirostres*, and also to various typical species of the family. The characters of the family are found in the bill being curved above and compressed at the tip. The tail and toes are long, and the tarsi short. The flycatchers are usually of small size, and their colours sober but pleasing. The familiar flycatchers of Britain are the pied F. and the spotted F. The former is found mostly in the N.W. of England, and appears to visit Norway and Sweden in summer. The colour of the female is a delicate brown above, and greyish beneath; the male being coloured dark brown above, the forehead having a white patch; while the tail is black, and the under parts white. The average length is 5 inches. The spotted F. arrives in England in May. It has been seen in S. Europe and S. Africa. Its general colour is a light brown above, the breast being white, and the sides yellowish brown. Its song is very feeble. The nest is ingeniously constructed of long hairs, grasses, mosses, &c.; and the eggs, numbering five, are bluish-white spotted with red. Exotic species are the paradise F. of India and the fork-tailed F. of tropical America.

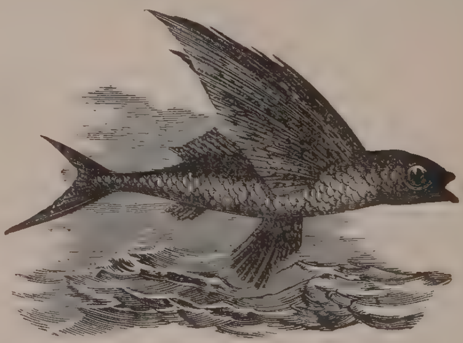
Fly'ing is the motion through the air of birds, insects, and bats. It does not include the leaping of fish, reptiles, and small quadrupeds, which is frequently assisted by membranes or fins acting as parachutes. As compared with walking and swimming, F. obviously is accompanied by the minimum of resistance from the atmosphere and the maximum of displacement. The travelling surfaces or wings have therefore to be greatly increased; they act like twisted inclined planes. When the wing ascends and descends, it rotates within the *facettes* or depressions situated on the scapula and coracoid bones. The curves described by the wing and body in F. form waved lines intersecting at each beat of the wings. Bell Pettigrew maintained that walking, swimming, and F. all take place in figure-of-8 curves; that wings (consisting of arm, forearm, and hand) are really screws, and reverse their planes at every stroke; and that they act not merely as elevators, but as buoys after the manner of kites. His experiments have been continued by Marey, Senecal, Ciotti, and others. The muscles being arranged in a certain cycle, the shortening of the flexor halves and the lengthening of the extensor halves diminish the angles formed by the lever bones, and by the opposite muscular actions these angles are increased, and this alternation makes F. The power of F. varies with the size of wing, the dragon-fly and the albatross being conspicuous examples. The weight of the bird is indispensable to flight, the body by its fall elevating the wings, which are opposed obliquely to the air. A good deal of exaggeration occurs in the descriptions of the air-sacs and hollow bones found in some flying animals. The fifteen air-sacs described by Sappey are more probably connected with respiration; they do not occur at all in the bat. The rapidity of vibration in wings has also been exaggerated; it has been said that the blow-fly vibrates its wings 300 times per second. The actual velocity of the wing is probably greater in the case of insects, as it arises from the thoracic muscle, while birds have muscles distributed upon the pinion. The *libellulæ* of the dragon-fly, however, enter the root of the wing. The buzzing, whirring, and whistling noises produced by wings have some relation to the rapidity of stroke. In the case of birds which skim, sail, or glide, the pinion is greatly elongated and ribbon-shaped, but generally there is a relation between the weight of the animal, the area of its wings, and the rate of oscillations. Most flying animals seem to have much more wing than they absolutely require, as considerable portions have been detached without seriously affecting F. It is maintained by De Lacy that the larger the animal the smaller relatively are its flying surfaces. The pigeon weighs eight times less than the stork, and has twice as much surface. A singular mode of F. is that practised by the large-winged oceanic birds, which begin by beating the water with the tips of their wings so as to force the body up. An account of the manner in which the feathers are arranged to make the wing impervious to air in the down stroke, and to increase or diminish its area, is given in Pettigrew's *Animal Locomotion*, p. 180. By the flexing of the wing in flight the *remiges* or 'rowing feathers' are opened up and the air permitted to escape. The wing is elevated by the muscle *pectoralis minor*, and depressed by the *pectoralis major*. Professor Pettigrew is of opinion that the effective stroke is given downwards and forwards, but the weight of observation seems to be against this view. Attempts have been made to fly, not by a machine specifically lighter than air, but by the use of rigid inclined planes driven forward in a straight line, or revolving planes (aërial screws), and also by the vertical flapping of wings. The *aërostat* of Henson and Stringfellow was invented in 1843. Its vanes or paddles were driven by a small steam-engine one-third of a horse power. It had huge fixed bamboo frames covered with canvas, and a rudder also made of canvas, but movable within limits. Its weight was 12 lbs. (including superimposed planes of canvas, or aëroplanes, added by Wenham in 1867), and its sustaining area 36 feet. This machine was started by being run rapidly down hill, the sails being set at a small angle to the ground. Sir George Cayley's *aërial screw* consisted of two corks, in which wing feathers were stuck. The corks were connected by a shaft, and a thread wound on to a bow of whalebone caused the corks to rotate in opposite directions. Phillipps, also, made a small metal steam-engine with fans (weighing 2 lbs.), which flew across several fields. In 1863 the Frenchmen, Nadar and De la Landelle, completed several clockwork models (*orthoptères*), but their chief success was in the *helicopteric*, in which the steam-driven screws were arranged in tiers upon two masts. As regards artificial wings, the earliest (not reckoning mere parachute falls) seem to be those constructed by Borelli (*De Motu Animalium*, Prop. 196, 1680). The wings consisted of a rigid rod in front, and flexible feathers behind. He conceived that the air's pressure drove the bird forward like a wedge in the direction of its base. It is generally admitted that the horizontal impulse depends on the yielding or *elevation* of the free extremities of the quills in the downward stroke. Marey further says that the converse takes place in the up stroke, the posterior margin of the wing in both cases making an angle of 30° with the horizon (*Méchanisme du Vol chez les Insectes*, 1869). The wings constructed by Marey and Straus-Durckheim do not seem to differ in principle from Borelli's. Pettigrew's wave wing, on the other hand, closely resembles the actual construction of a bird's wing. It has no rigid margin, is twisted on itself, and tapers from the root to the tip. Elastic reeds or fine steel rods are covered with silk, india-rubber, linen, &c. The wing is valvular, so that during the up stroke the superimposed air passes through, and it is made to vibrate obliquely, not vertically. The experiments made seem to destroy Chalvier's theory that all the work of F. was done by the depressor muscles, the air forcing the wing upwards to its original position. Recently a F.-machine was put forward by Maxim as likely to solve the problem of artificial locomotion through the air. Experiments were made, and were deemed to be so far satisfactory, but no further steps would appear to have been taken in the matter. The chief difficulty which inventors have to contend against is the impossibility of reducing the weight of a machine to the required minimum.

Flying Bridge, a ferryboat attached by a long chain or rope to a buoy anchored in the centre of a river or to the opposite bank. The position of the buoy depends upon the width of the river and the rapidity of the current, but when properly chosen the action of the current, combined with the resistance of the chain, causes the boat to move across the river. By setting the boat obliquely to the current, by the help of the rudder, the action of the current is resolved into two forces—one tending to separate the boat from the chain, and the other to move it at right angles to the chain. The resistance of the chain to breaking counteracts the first of these, and the second only takes effect, the boat thus sweeping across the stream in an arc of a circle of which the buoy or the middle of the stream is the centre. Flying bridges are often used for military purposes.

Flying Drag'on or **Lizard,** a species of *Lacertilia*, or lizards, found in the E. Indies and Indian Archipelago, and so named from the possession of a *patagium* or wing-like membrane, enabling the animal to take flying leaps from tree to tree. The skin on each side of the body is extended and supported on six of the anterior ribs, which extend in a straight manner from the spine. This apparatus acts merely as a kind of parachute, and can in no sense be said to represent wings or organs of true *flight*. The colour of the F. D. is an olive brown, and the average length about 5 or 6 inches. An allied species is the fringed dragon of Sumatra and Java. (See DRAGON.) These lizards form the modern representatives of the great extinct reptiles known as *Pterodactyles* (q.v.).

Flying Dutchman, The, like many other mediæval legends, is a growth by accretion rather than a single independent creation. It is traceable to the 16th c., and is typical of a time of rude religious feeling and of wild seafaring adventure. The germ of the story, in its varied forms, is akin to that of Odysseus and the Wandering Jew. For some great sin an accursed mariner is doomed to perpetual and aimless cruisings. In modern forms of the legend he is rescued from his fate by some holy interposition—a religious amulet or a faithful woman's love. According to a late version, the F. D. was an Amsterdam vessel, the master of which, Van der Decken, swore on a certain tempestuous night to make the Cape or to be 'eternally damned,' and 'though he should beat there till the day of judgment'; and there he is still to be seen, with crowded sail, tearing along in the wildest weather. Heine has made the legend the subject of a beautiful tale; Wagner weaves it into one of his finest operas, treating it as symbolical of the universal longing for rest from the storms of life.

Flying Fish, a name popularly given to all fishes which, from the large development of their pectoral fins, possess the power of leaping from the water and of supporting themselves for short distances in the air. The typical F. F. is the Teleostean species *Exocœtus volitans*, belonging to the family *Esocidæ*, or that of the pikes. In this fish, found in warm seas, the pectoral fins are elongated, as is also the lower lobe of the tail-fin. No teeth are borne on the palate. The swimming or Air Bladder (q.v.) is of very large size. The 'flight' of the F. F. is short and imperfect, and appears to result in greater part from the impetus which the fish gains in its primary rush from the water, though the distance covered by a series of flights is sometimes hundreds of yards, the fish striking the surface of the water and darting upward and forward without becoming submerged. In this way escape from its enemy is often attained. Scores are caught every night on the main decks of steamers and ships crossing the Indian Ocean. Another species also known by the name F. F. is the Flying Gurnard (q.v.). The true F. F. swim in large shoals, and form the prey of other fishes. They are much esteemed on account of the delicacy of their flesh, and



European Flying Fish.

may be caught at night by exhibiting a torch or other light, this process seeming to attract them. The dolphin-fish or *Coryphæna* is the natural enemy of the F. F., and pursues them with great dexterity.

Flying Fox. See KALONG.

Flying Gur'nard, a species of *Triglidæ* or Gurnards (q.v.), so named from the large development of the pectoral or breast fins, by aid of which they are enabled to raise themselves from the water. The common F. G. is the *D. volitans* of naturalists, and is very common in the Mediterranean Sea. It attains a length of from 10 to 15 inches, and is of a brown colour above, variegated with bluish hues. The under parts are rose-coloured, and the fins are black and spotted with blue. An allied species is the Indian F. G. of the Indian Ocean, which is distinguished by the possession of two elongated filaments placed in front of the dorsal fin. Like the true flying fish it is pursued by the dolphin-fish.

Flying Le'mur, or **Colu'go,** a peculiar genus of *Mammalia*, so named from the possession of an expansion of the skin along the sides of the body, uniting the fore and hind limbs, and also extending between the hind-limbs and tail. The possession of this membrane enables the animal to effect springing leaps from tree to tree, but does not confer upon it any power of true flight. The flying lemurs have been by some naturalists associated with the lemurs or lower *Quadrumana*, or monkeys, while other authorities have regarded them as forming a connecting link between the order *Insectivora* (moles, shrews, &c.), and that of the *Quadrumana*.

Flying Lemur.

The F. L. of the Eastern Archipelago is the most familiar species. The toes are free, and not united by or connected with the membrane. Each foot has five toes, but neither the great toes nor the thumbs can be opposed to the other digits, so as to convert the feet into hand-like organs, as in many monkeys. The teeth resemble in many respects those of *Insectivora*. There are four upper and six lower incisors, and two canines, four præmolars, and six molars in each jaw. The six lower incisors are divided into narrow strips or portions, like the teeth of a comb. The flying lemurs average in length about $1\frac{1}{2}$ feet, are nocturnal in habits, and live chiefly on fruits, small birds, and insects.

Flying Mouse. See FLYING PHALANGER.

Flying Phalan'ger or **Oposs'um,** a group of Marsupial (q.v.) mammals, allied to the kangaroos, &c., and included in the family *Phalangistidæ*, or that of the phalangers. The most familiar examples are the flying-squirrel, the great F. P., the Ariel P., and the Taguan. The opossum mouse, or flying mouse, is also nearly allied. Like the Flying Lemur (q.v.), the F. P. has a fold of skin along each side of the body, uniting the fore and hind limbs. It is nocturnal in habits, and its *patagium* or fold of skin enables it to take flying leaps among the trees. The tail is not prehensile. The F. P. is confined in its distribution to Australia. The flying mouse attains a length of about $3\frac{1}{2}$ inches, while the other species vary in length from $1\frac{1}{2}$ to 2 feet. The prevailing colour is brown, and the fur is soft and glossy.

Flying Squid, a genus of *Cephalopoda* (q.v.), or cuttle-fishes. These animals derive their popular name from their habit of leaping from the water, sometimes with force sufficient to land them on the deck of a ship. They belong to the Dibranchiate cuttles, and to the section *Decapoda* ('ten-armed'). They are included in the family *Teuthidæ*, or that of the Squids. The flying squids are most frequent in tropical seas, but are also found in temperate regions.

Flying Squirr'el, the name given to various genera of Rodent *Mammalia*, resembling the Flying Lemur (q.v.), and Flying Phalanger (q.v.), in that the body is provided with lateral expansions of the skin, forming a kind of parachute serving to sustain the animal in its flights from tree to tree. The flying squirrels occur in S. Asia, Polynesia, N.E. Europe, N. America, and Siberia. They belong to the genera *Pteromys* and *Sciuropterus*, and are included in the squirrel family (*Sciuridæ*). The Taguan F. S. has no relationship with the phalangers. It inhabits India. The Assapan is an example of the second genus, this form occurring in N. America, and attaining a length of 5 or 6 inches. The colour is brownish grey above, and white below. The fur is not of high value, but is frequently used along with that of other species of Squirrels (q.v.).

Flying Squirrel.

Fly-Pow'der is the name given to a compound of metallic arsenic and arsenious acid sold on the Continent for the purpose of killing flies. Such a dangerous compound should never be used for such a purpose. Flies and gnats are repelled by the odour of the oils of turpentine and rue, and quassia acts upon them as a poison.

Fly'trap. See DIONÆA.

Fly'wheel, in mechanism, a wheel fixed upon a revolving shaft and having a heavy rim, its use being to equalise the motion of the shaft, which without it would at some times rotate much faster than at others. Its theory can be most easily explained by reference to the F. of a steam-engine driving the machinery of a factory. Here, in ordinary cases, the resistance (due to the machinery) which has to be overcome by the engine changes continually throughout the day, but for any small interval of time (as that in which the engine makes one revolution) it is practically constant. The mean effort exerted by the engine in that period has been equal to the mean resistance to be overcome; but instead of being constant, it has varied continually, being at one instant smaller and at another greater than the resistance. *Of itself*, therefore, it could not drive the machinery continuously, but only by jerks. A heavy F. placed upon the shaft, however, entirely obviates this difficulty, and by its means any required degree of steadiness can be obtained. The engine expends energy, at starting, in accelerating the velocity of the mass forming the F., and this energy remains stored up in the wheel after it has attained the required velocity. When the resistance becomes greater than the effort, the deficiency is supplied from this storehouse of energy, the velocity being retarded in consequence; when the effort exceeds the resistance, the surplus is absorbed by the F. again with a corresponding acceleration. By making the F. heavy enough, the proportion borne by this surplus and deficiency to the whole energy stored up may be made as small as we please, and thus the fluctuations of speed may be made correspondingly small. In ordinary machinery the ratio borne by the difference between the maximum and minimum velocities to the mean velocity is about 30 : 1.

Any machine (as a punching machine, for instance) in which the resistance varies very greatly periodically should be fitted with a F. of its own besides the one on the engine. It may be mentioned that in certain cases flywheels, or their equivalent, are employed to store up energy in order that, by being brought suddenly to rest, they may be able to exert an enormous pressure through a very small distance, as in stamping a coin.

Foch'abers (Gael. *Faichaber*, 'the plain of the confluence'; anciently *Beul-ath*, 'the mouth of the ford'), a neat, well-kept village of Elginshire, on the Spey, 9 miles E. of Elgin. F. is beautifully situated in a valley, and consists chiefly of a square and four main streets. The principal buildings are the Established, Free, and Episcopalian churches; and the Milne Free School, founded by A. Milne, a native of F., who died at New Orleans, U.S., and left 100,000 dollars for the purpose. Near F. is Gordon Castle, a seat of the Duke of Richmond and Gordon. Pop. 1101.

Fo'cus (Lat. 'a fireplace'), in physics, is the point at which rays of light, heat, or sound meet after reflection or refraction. From certain important geometric properties of the conic sections with respect to certain points, the name was applied to these points, and has now undergone a much wider extension of signification in mathematics.

Fodd'er (Old Eng. *foder*, Dutch, *væder*, Ger. *futter*), a name given to the food of cattle. The term is vaguely employed, but generally it is restricted to such plants and crops as are consumed in a green or fresh and succulent condition. F. is also an obsolete term for a weight of lead or other metal in England, the precise amount of which varied in different localities.

Fœ'nus Naut'icum (Lat. 'interest on ships') is the rate of interest proportioned to the risk which a person lending money on a ship, on Bottomry Bond (q.v.), as it is called, is entitled to demand.

Fog (of Danish origin), or **Mist** (Old Eng. *mist*, 'darkness') is produced by the condensation due to cooling of the aqueous vapour in the air into the form of minute drops of water. The direct cause of its presence may therefore be either the indraught of a cold current into a warm mass of air, or of a warm current into a cold mass of air. The rapid cooling of the ground in contact with air is also frequently attended with the appearance of F., as in the case of the evening mists. Morning mists are often vaporised and dispelled as the day advances by the heat of the sun.

Fogarasy, János, a Hungarian scholar and lawyer, was born at Käsmárk in 1801. He gained considerable reputation for his works on jurisprudence, filled several public offices, and in 1848 was made a member of the financial council of Pesth. F. zealously studied the Magyar tongue, and made important contributions to philology. Among his writings are *A' Magyar nyelo' metaphysicája* (1834), *A' Magyar nyelo szelleme* (1845), a Magyar-Latin dictionary (1855), and various legal and linguistic works. F. and another eminent Hungarian scholar, Czuczor, are the authors of the Dictionary of the Hungarian Academy.

Foggia, a town in the S. of Italy, in the province of the same name, 80 miles E.N.E. of Naples, on the river Cervara. It is the commercial centre of Apulia, and has great cornstores, and a trade in cattle and wine. It possesses several fine squares and churches, a cathedral, theatre, library, botanic garden, museum, &c. F. is said to have been built from the remains of the old Arpi. The Emperor Friedrich II. held a parliament here in 1240. It was the scene of his wife's death in 1241, and of Manfred's victory over the Pope's troops in 1254. In 1731 F. was almost destroyed by an earthquake. Towards the end of the 18th c. it was the seat of the court of Ferdinand I. Pop. 41,125.

Fog-Signals, audible signals used on board ship, on the sea-coast, on railways, and elsewhere during fog or mist, when the ordinary visible signals cease to be of use. The signals commonly used at sea are the striking of a bell or gong, or the blowing of a horn or steam-whistle; the latter, where it can be used, being probably the most effective. Fog and mist very greatly interfere with the transmission of sound through the air, but further experiments are required in order that precise conclusions may be arrived at on this subject. Experiments made by Tyndall have shown that an optically clear atmosphere is not always the best for transmitting sound, and that the report of a gun in certain circumstances is superior as a fog-signal to a horn or steam-whistle. Such signals as are mentioned above do no more than announce the presence, and approximately the position, of a vessel. In the navy a code of F.-S. is in use, by which the ships of a fleet can communicate in thick weather; there does not seem any reason to prevent the use in the merchant service of an alphabet 'of longs and shorts' (like the Morse alphabet), which would render communication, at present impossible, very easy. The F.-S. used on railways are small packets of detonating material, placed upon the rails and exploded by the wheels of the engine passing over them.

Föhr, one of the North Frisian islands belonging to Denmark, lies off the W. coast of Slesvig, in the North Sea. Area, 28 sq. miles; pop. 4150, mostly Frisians. It exports to Hamburg large quantities of oysters, cheese, and hosiery. Wyk, the chief town, is a bathing-place, and has had steamboat communication with Cuxhaven on the Elbe since 1833.

Foil, a sword-like weapon used in fencing, is a pliable, highly-tempered bar of steel, from 31 to 38 inches long. The blade is edgeless, and is protected at the point by a 'button.' The F. is used only for thrusting.

Foil (Fr. *feuille*, Lat. *folium*, 'a leaf'), in the arts, plates of metal beaten or rolled out to a state of great tenuity. Tin-F. not exceeding $\frac{1}{1000}$th of an inch in thickness is much used for lining boxes and packages in order to exclude moisture, or to preserve the flavour and aroma of their contents. When covered with mercury it is also employed for silvering looking-glasses. Till 1840 tin amalgam was exclusively employed for that purpose, but the pernicious effects its preparation had upon the health of the workmen has chiefly led to the adoption of other methods of silvering. F. of copper and its alloys has long been manufactured at Nürnberg and Fürth in Bavaria; hence it is sometimes called *German F.* The manufacture of bronze powders is simultaneously carried on there in order to utilise the F. waste. Highly-polished thin sheets of silvered copper constitute jeweller's F., which is coated with transparent-coloured varnishes, and placed under precious or factitious gems to enhance their brilliancy and colour.

Foils, in architecture, are the compartments of an arch or spandril formed by arcs of circles in Moorish and Gothic styles. The foils in an Arabian arch are always uneven in number.

Foils.

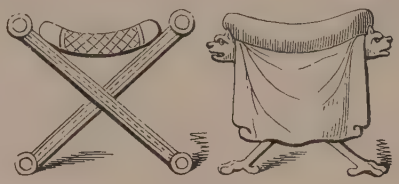
Foix (Lat. *Fuxum*), a small French town in the department of Ariège, 467 miles S. of Paris. It stands on the Ariège, is very irregularly built, and is overlooked by three towers, part of the old château of the Counts of F. The chief building is the Gothic church of St. Volusien. F. has ironworks and some trade in pitch. Pop. commune 7568; arrond. 77,030.

Foix, Comtes de, an old French family which arose in the 11th c. Among its chief members are **Roger**, who received from his uncle, Comte de Carcassonne, the lands of F., now the department of Ariège, whence he took the title Comte de F. He died in 1064. His nephew, **Roger II.**, joined the first crusade, and died in 1125. Roger II.'s grandson, **Roger-Bernard I.**, received large additions to his estates from Raymond V. of Toulouse, and in 1185 obtained the marquisate of Provence from Alfonso II. of Aragon. His son **Raymond-Roger** was the ally of Raymond VI. of Toulouse in the Albigensian crusade, and after a determined resistance to Simon de Montfort, in which he proved himself a brave and skilful soldier, died in 1223. He was a patron of the Troubadours, and wrote several poems. **Roger-Bernard II., the Great,** was the sole ally of Raymond VII. of Toulouse against the forces of Northern France. He was twice excommunicated, and died in 1241. His grandson, **Roger-Bernard III.**, one of the best French poets of the 13th c., fought against the house of Armagnac, a feud maintained after his death in 1302 by his son **Gaston I.**, and ended at the time of his grandson, **Gaston II.**, who contributed greatly to the victory of the Navarrese over the Castilians at Tudela in 1335, did good service against the English in France, and died in 1343. He was succeeded by **Gaston III.**, who was born in 1331, and surnamed *Phœbus* from his beauty. He was made king's lieutenant in Gascony and Languedoc, married a daughter of the King of Navarre, served against the Sclavic heathens of Prussia, rescued the royal princesses when they were shut up in Meaux during the Jacquerie, and died in 1391. He was famous for his chivalrous courage and devotion to the chase. He is said to have kept 1600 dogs, and wrote a work, *Phèbus des deduitz de la Chasse des Bestes sauvaiges et des Oyseaulx de Proye*, which remained popular with the great nobles and gentry long after the Middle Ages had expired. Froissart, who spent a considerable time in Gaston III.'s residence of Orthes, where he picked up many of the most interesting tales in his Chronicle, has given a careful but over-flattering portrait of this prince. On his death the F. estates passed to another branch of the family. **Gaston IV.**, ably opposed the English in Guienne, received the seignory of Carcassonne and the counties of Roussillon and of Cerdagne from Louis XI., and died in 1472. His grandson, **Gaston de F., Duc de Nemours,** was the most famous of the family. He was a son of Jean de F., Vîcomte de Narbonne, and of Marie d'Orléans, sister of Louis XII.; was born in 1489; was made Duc de Nemours in 1505, and in 1511 commander of the French in Italy. He defeated the Swiss at Como and Milan by his brilliant strategy, routed the besiegers of Bologna, beat the Venetians near Brescia and routed that city, and on 11th April, 1512, gained the crowning victory of Ravenna over the Spaniards, but was killed through his rash daring, and his death rendered the success fruitless. He was surnamed the *Thunderbolt of Italy*, and is almost unsurpassed as an example of youthful military genius. On his death the estates of F. passed to the King of Navarre, and in the time of Henri IV. were united to the French Crown.

Fok'shan, Fokchani, or **Focsani,** a town of Roumania, on both banks of the Milkova, which partly separates Moldavia and Wallachia, 45 miles W.N.W. of Galacz. It is larger on the Moldavian side, and has a total pop. of 17,039. There is an active river trade, chiefly in corn, with Galacz, and in the vicinity is produced the best wine of Moldavia. The Turks, who were defeated at F. with great loss by the Greeks, 1st June, 1821, set fire to the town in September, 1822.

Folc'land, or **Folkland,** was the land belonging to the state, corresponding in the old English constitution to the Roman *ager publicus*, and opposed to *bocland* or hereditary estate. With the growth of the kingly power the people's land changed into the king's land, and, after the Norman conquest, the F. became the *terra regis*, the personal estate of the sovereign. When the hereditary nature of the English monarchy was established, any private estates which might belong to the several rulers were fused with the F., which from William I. to William III. was viewed as the king's personal property. Now, however, it is placed at the disposal of Parliament, to be used in the people's service in the same manner as the other state revenues. See Freeman's *Growth of the English Constitution*, chap. iii.

Folding-Stool, or **Faldstool,** a chair or stool which folded up like our camp-stool, and was made of metal or wood, and covered with silk or any other rich fabric. Formerly the bishops carried about folding-stools, and used them as their seats in any church other than their own.



Folding-Stool.

Földvar (Magyar, 'land-fortress'), or **Földvar Duna,** a town of Hungary, on the right bank of the Danube, in the county of Tolna, 80 miles S. of Buda-Pesth. It is strongly and beautifully situated on a hill, is noted for its sturgeon-fishery, and has trade in wine, corn, and salt. Pop. 13,728.

Foley, John Henry, R.A., a sculptor of rare force of genius and artistic accomplishment, born in Dublin, 24th May, 1818, distinguished himself in the drawing and modelling schools of that city, and, removing to London, entered the Royal Academy at the age of sixteen. He was elected Associate in 1849, and R.A. in 1855. He first exhibited in 1839, when his two models, 'Innocence' and 'Death of Abel,' attracted favourable notice. His 'Ino and Infant Bacchus' (1840), purchased by Lord Ellesmere, his 'Death of Lear' (1841), 'Lear and Cordelia' (1842), 'Venus rescuing Æneas' (1843), bear witness to the industry with which he followed up his first success. He afterwards produced 'Prospero and Miranda,' 'The Mourner,' 'Egeria,' &c. He was chosen by the Queen to execute the figure of the Prince Consort for the Albert Memorial in Hyde Park. His fame, indeed, most securely rests on this magnificent statue, his fine marble statue of 'Hampden' in Westminster Palace, his 'Lord Hardinge,' now at Calcutta, and the magnificent equestrian statue of 'Sir James Outram'—a work inspired with vigour and heroic feeling, and the artist's masterpiece. Like the 'Hardinge,' the 'Outram' is now in Calcutta. F. died in London, 27th August, 1874.

Folia'tion, in geology, is, according to Sedgwick, a 'separation into crystalline layers of different mineral composition,' differing thus from cleavage, which is merely a disposition to *split* without mineralogical changes. Darwin gives many fine examples in his *Geology of South America*, and suggests that F. and cleavage are really parts of the same process.

Folign'o, a town in the province of Perugia, Central Italy, on the Torpino, 15 miles S.E. of Perugia by railway. Walls surround the town, but are no longer used as fortifications. It has a fine cathedral, a Palazzo Communale, a theatre, promenades, &c. The 'Madonna di F.' by Raphael is now in the Vatican. The chief manufactures at F. are parchment, wax-candles, woollens, silks, and playing-cards. There is considerable trade in cattle, and the neighbourhood is plentifully covered with vineyards, and olive and mulberry groves. The waterfalls of the Torpino near the town are very fine, and there is a splendid cavern of stalactites. F. is the Umbrian Fulginii and the Fulignum of the Middle Ages. It was partly destroyed by an earthquake in 1832. Pop. 23,202.

Folkes, Martin, F.R.S., an English antiquary, was born in London, 29th October, 1690, studied at Cambridge, was elected Fellow of the Royal Society in 1714, and in 1741 became its president. He was afterwards president of the Antiquarian Society, and a member of the Academy of Sciences at Paris. Oxford honoured him with the degree of D.C.L., and his own university with that of LL.D. He died 28th June, 1754. F. contributed many dissertations to the *Transactions* of the Royal and Antiquarian Societies. One of these, *A Table of English Gold Coins*, was reprinted in 1745 with additions, and a new edition appeared in 1763 under the title of *A Table of English Silver and Gold Coins, new reprinted with Explanation* (2 vols.).

Folkes'tone (Lat. *Lapis Populi*, 'the stone or fortress of the people'), a thriving seaport and a fashionable bathing-place in the S.E. of Kent, lies in a hollow at the base of high cliffs, 5 miles W.S.W. of Dover, and 83 E.S.E. of London by railway. It has a good harbour and a pier, from which a view may be had of the French coast, and coastwise from Dover to Hastings. There is a considerable trade and regular steam communication with Boulogne, distant about 30 miles. The fine parish church occupies the site of the ancient church of the priory of St. Eanswith, founded in 1095, which in its turn had succeeded the nunnery of St. Eanswith, the first house established in England for female devotees. The harbour has been greatly extended and improved, and the esplanade, promenades, and terraces of houses are spacious and well built. Harvey, whose statue has been placed here, was born at F. The imports in 1894 were considerable, the chief of which were 553,881 lbs. of leather, 187,068 pairs of leather gloves, 483,158 great hundreds of eggs, 413,583 gallons of wine, and £5,762,883 worth of silk goods. F. forms part of the Hythe parl. district, which returns one member. Pop. mun. bor. and civ. par. (each) 23,905; and reg. sub-dist. 30,293.

Folk'-Lore (Ger. *Volks-Lehre*), a term borrowed from the German to describe that floating mass of legendary narrative, song, and saying which takes its rise during the early life of a nation, and exists solely in the memory of the people, unless at a later date its remains be gathered up and preserved in literary form. F.-L. in its wide sense belongs to anthropology and antiquarianism as much as to literature, since religious myths, ethnic peculiarities, physical conditions, mental characteristics, and social customs, all come within its scope. The term is, however, generally restricted to the literature originating in that period of national history which the Germans call *sagenzeit*, or tradition-time, a period through which all peoples pass. In regard to these early sagas, it must be noted that they are not, even in their most fantastic dress, deliberate fictions, but are believed by teller and hearers; and that they grow insensibly by a very natural process of accretion, until what has been a legend or a ballad may result in a complete cycle of connected traditions. There is a further tendency in many cases to group a set of tales and poems round the centre figure, such as Beowulf was to the Low German, Karl the Great to the Frank, Arthur to the Briton, Fingal to the Gael, the Cid to the Spaniard, or Hiawatha to the American Indian. F.-L. is seen at its perfection in Hesiod and Homer, in the poetical traditions of the Greeks, 'the abundance, the beauty, and the long continuance' of whose early literature Grote pronounced a 'phenomenon which has no parallel elsewhere.' The F.-L. of Rome, if less rich and splendid, is even more eminently national than that of Greece; her early history is but a collection of F.-L. recast by subsequent historians. Modern Italy has produced another legendary growth of a different character, exhibited in the collection of Busk (*Roman F.-L.*). The literary history of Oriental nations is marked by a F.-L. equally abundant, of which the Arabian or Arabico-Egyptian *Thousand and One Nights*, the Persian *Sindibad Nameh*, the *Pantschatantra*, and the Hindu Vedistic and Brahmanical legends present distinctive phases, while the Slavic races have also their stock of popular traditions. (See Eichhoff's *History of Slavic Literature*, Ralston's *Russian F.-L.*) Among the Gothic peoples of early Europe, however, their F.-L., which flourished with great luxuriance, exercised an influence on the formation of national character not equalled in the case of any other people. Tacitus mentions the 'old songs' of the Germans, and Jacob Grimm (in his *Deutsche Mythologie*) has thoroughly investigated the growth of these ancient traditions, which comprise, among many others, the *Niebelungen Lied*, the *Volsunga Saga*, the *Eddas*, and the *Lay of Beowulf*. (See also Murray's *Manual of Mythology*, Baring-Gould's *Myths of the Middle Ages*.) The Welsh *Mabinogion* is a collection of Celtic F.-L. As specimens of French F.-L. may be mentioned the *Amadis de Gaul*, the *Chronique de St. Denis*, *Chronique de Turpin*, *Roman de Garin le Loherain*, and the *Chansons de Geste* (Fauriel's *Origine de l'Epopée Chevaleresque*, Paris's *Romans des Douze Pairs de France*). In this country the antiquarian side of F.-L. has been treated of by such writers as Browne (*Antiquitates Vulgares*), Brand (*Observations on Popular Antiquities*), Hone in his *Every-Day Book*, Chambers in his *Book of Days*, and Swanson in his *Handbook of Weather F.-L.* English F.-L. in its purely literary aspect, is of great antiquity and interest. Geoffrey of Monmouth's *Chronicle* is apparently constructed of F.-L.; while *King Horn*, the *Romance of Alexander*, *Guy of Warwick*, *Bevis of Hampton*, *Havelok the Dane*, the *Proverbs of Hendying*, the *Robin Hood Ballads*, and *Chevy Chase*, are well-known instances of English popular traditions and ballads. See Percy's *Reliques*, Campbell's *Tales of the W. Highlands*, Warton's *History of English Poetry*, Scott's *Border Minstrelsy*, &c.

Folk'mot (Old Eng. *folc-gemot*, 'meeting of the folk or people'), the name given in early English times to the popular assembly of the shire, which was composed of representatives from hundreds and townships. The scirgerefa or sheriff presided over the F., by which he was at one period probably elected, though not within historical knowledge. The F., according to Edgar's law, was held twice in the year, but it assembled in arms on any occasion of emergency. It is incorrect to suppose, as Kemble does, that this was the origin of the Witenagemote, since the F. exercised no legislative authority, but only judicial functions, and the Witan was at no time a representative body. See Stubbs's *Constitutional History*, vol. i., Freeman's *Norman Conquest*, vol. i.

Folk'right or **Folcright**, an old English law term denoting the rights of the people by common law. F. would seem to have been first mentioned in the laws of Eadward the Elder.

Fomenta'tion (Lat. *fomentatio*, from *foveo*, 'I keep warm'), an application of warmth and moisture to a diseased or painful part. This may be done by means of a cloth moistened with water and covered with gutta-percha cloth, to prevent evaporation; or by cloths wrung out of hot water, and frequently renewed. The water may be medicated with vegetable infusions, and in this manner opium, belladonna, camomile, turpentine, &c., are used as topical applications.

Fonblanque', Albany William, a journalist of high ability and character, was born in London in 1797. His father was an equity barrister of Huguenot descent, and F. was for a time a pupil of Chitty, the special pleader; but before he was twenty years of age took to journalism. From 1820 to 1830 he wrote for the *Times* and *Morning Chronicle*, while he contributed to the *Examiner*, the *London Magazine*, and the *Westminster Review*. From 1830 to 1847 he edited the *Examiner*, and showed a humour and a trenchancy of style which have been compared to those of Swift. F. was a singularly conscientious and honourable, as well as an able, writer. In 1847 he retired from the *Examiner*, and in 1852 was appointed to the post of statistical secretary to the Board of Trade, but continued to write at intervals for journals and magazines. He died 13th October, 1872. In 1837 a number of his articles from the *Examiner* were reprinted under the title *England under Seven Administrations.* See *Life and Labours of F.*, edited by his nephew.

Fon'di, a decayed town in the province of Caserta, S. Italy, 50 miles S.E. of Rome, near the miasmic *Lacus Fundanus*, and on the Appian Way, which is here in a very perfect state. It is enclosed in part by cyclopean walls, and has a fine cathedral, while the vicinity still produces the *vinum Cæcubum* of classic times, though, it is to be feared, of somewhat poorer quality. Pop. 7731.

Fond du Lac (Fr. 'bottom,' *i.e.*, 'inner end of the lake'), the capital of a county of the same name, Wisconsin, U.S., on Lake Winnebago, at the mouth of F. du L. River, 148 miles N.N.W. of Chicago. It is the junction of several railways, and has regular steam communication with the ports on the lake. There are some fine churches, a public library, public gardens, &c. Water is supplied by about 1000 artesian wells, and is noted for its mineral properties. Among the principal works are steam saw-mills, planing-mills, flour-mills, foundries, waggon and carriage factories, paper-mills, and cigar factories, besides large blast-furnaces and tanneries. Pop. 12,024.

Fonseca, Bay of, or **Gulf of Concagua,** a Central American inlet of the Pacific, between San Salvador on the N.W., Honduras on the E., and Nicaragua on the S.E. It is 50 miles long from S.E. to N.W.

Font (Lat. *fons*, *fontis*, 'a spring or well') is the name given to the receptacle for the water used in Christian baptism. As this was performed in the early centuries by immersion, the F. was a large basin in the centre of the Baptistery (q.v.), generally about 6 feet across, and 3 or 4 deep, and below the level of the floor, like a tomb, with symbolic reference to the believer's being buried with Christ by baptism. The descent into it was generally by three steps, symbolical of the believer's renouncing the world, the flesh, and the devil; and the ascent by three, symbolical of his professing belief in the Trinity. The step on which the bishop stood celebrating the rite made up the sacred number, seven. When the innovation of baptism by aspersion was introduced in the Western Church, the F. took the form of a small vessel, such as is used at the present day. The *material* as a rule was stone, the basin marble. In *form* fonts were originally merely circular basins. In the 13th c., however, they were made octagonal, probably with reference to the eighth day of the child's life being the proper time for baptism, as it was for circumcision, between which and baptism the early Church held there was a strong analogy, the eighth being regarded as the first day of independent existence (*cf.* Gen. xvii. 12; Lev. xxii. 27). In the 14th c. and 15th c. they were richly sculptured. They were not at first raised on supports, but were afterwards supported on pillars, usually five, to represent our Lord and the four Evangelists. A F. at Hildesheim of the 13th c. rests on personifications of the rivers of Eden, for the four cardinal virtues; one at Salzburg, on four lions, and one at Liège, like the brazen sea of Solomon's temple, on twelve oxen. Latterly, too, the supports rested on a pedestal of three steps, for the same reason, as there were three steps in the old immersion F. As regards its *position*, as baptism is the rite of admission into the Church, the F. properly stood not far from the entrance of the church. Originally a F. was placed only in the bishop's church, which was therefore called 'the mother-church,' but latterly in all churches.

Fon'tainebleau, a town and château in the department of Seine-et-Marne, France, 2 miles from the left bank of the Seine, and 35 miles S.S.E. of Paris. The town owes its origin to the château, which is one of the most magnificent buildings in France. As early as the time of Louis VII. it was a fine feudal structure, and it has been splendidly remodelled or extended by almost every succeeding king. It is a *mélange* of styles, and among its more interesting portions are the chapel of the Sainte Trinité, erected by François I., the gallery of frescoes of the 16th c., the gallery of Diana, restored by Napoleon I., the hall of council, decorated with pictures by Boucher, the ornate throne-room, and, grandest of all, the gallery of Henri II., containing a fine series of mythological pictures. The château, with its beautiful gardens, courts, and fountains, is surrounded by the grand old forest of F., which covers an area of 65 sq. miles. Of the historical events connected with the château, the more important are the execution of Monaldeschi in the Galerie des Cerfs by order of Christina of Sweden; the signing of the revocation of the Edict of Nantes by Louis XIV. in 1685; the celebration of Napoleon's marriage with Marie-Louise; and the imprisonment of Pope Pius VII. in 1816. The town has, among other good buildings, two large hospitals, one the gift of Madame de Montespan. There are large manufactures of porcelain and crockery, and an active trade in sandstone, grain, grapes (the famous *chasselas de F.*), and other fruits, horses and cattle. Pop. commune 14,222; arrond. 86,291.

Fonta'na, the name of several Italian painters in the 16th and 17th centuries, of whom the most famous is **Domenico F.**, who was born at Mili, on Lake Lugano, in 1543. Trained to the profession of an architect at Rome, F. became the favourite of Cardinal Montalto; and when the latter succeeded to the popedom as Sixtus V., he was made papal architect, and as such completed the cupola of the basilica of St. Peter, placed on its piazza the obelisk which had been brought from Egypt in the reign of Caligula, designed the library of the Vatican, and restored the columns of Trajan and Antoninus. The successor of Sixtus V., Clement VIII., disgraced F., who took the post of architect to the King of Naples, and designed a royal palace and harbour, which, however, he did not live to complete. F. died in 1607.—**Giovanni F.**, brother of the preceding (born 1540, died 1614), distinguished himself by his skill in hydraulic architecture.—**Carlo F.** (born 1634, died 1714) was also papal architect.

Fontanelles, membranous intervals or spaces found in the skulls of infants and of young animals, which the process of ossification has not reached. See SKULL.

Fontanes', Louis, Marquis de, known for his style of rhetoric and poetry as 'Racine's latest descendant,' belonged to an old Protestant family of Languedoc, and was born at Niort, 6th March, 1757. He first became known in literature as the translator of Pope and Gray, and as the writer of two original poems, *Le Cri de mon Cœur* and *Le Verger*, both published in 1778. In politics F. was originally a royalist, then a republican, although of a very moderate type, editing, during the Revolution, a journal entitled *Le Modérateur*. Compelled to take refuge in England after the 18th Fructidor, he there made the acquaintance of Chateaubriand. Returning to France after the 18th Brumaire, he became an ardent admirer of Napoleon, on whose fall he transferred his service to the Bourbons, and was raised to the peerage under Louis XVIII. His later years were devoted to an epic, *La Grèce délivrée*. His death took place 17th March, 1821, in which year also a collection of his speeches was given to the public. A collection of his works both in prose and verse was edited by Sainte-Beuve in 1839.

Fon'tenay is the name of thirty-four places in France, of which the most important is **F.-le-Comte** (called during the Revolution *F.-le-Peuple*), a town in the department of Vendée, France, on the river Vendée, 25 miles S.E. of Napoléon Vendée. It has a fine Gothic church, with a crypt dating from the 11th c., a church of St. Jean, notable for the beauty of its spire, a Renaissance fountain, some manufactures of linen and coarse cloths, and a trade in timber, grain, hemp, wine, &c. F., which owes its origin to the château of the Comtes de Poitou, was ceded to the English, from whom it was taken by Du Guesclin after a heroic defence. It suffered ten sieges during the religious wars, and was dismantled under Louis XIII. The Vendéens gained one of their greatest victories here over the Republicans. Pop. commune, 9864; arrond. 143,578.

Fontenelle', Bernard Le Bovier de, a once famous French author, born at Rouen in 1657, was the son of a local procurator and of Martha, a sister of Pierre and Thomas Corneille. He began literary life at Paris under the auspices of his uncle. Here he made the friendship of St. Pierre, and soon joined in the great literary quarrel of Moderns *versus* Ancients, vehemently criticizing the masterpieces of Greek art, held up as models by Racine and Boileau. Of Theocritus he said, 'Ses bergers sont trop bergers,' a phrase which has become classical. A few operas, his *Dialogues des Morts*, the *Entretiens sur la Pluralité des Mondes* (the speculative part of which is based on the Cartesian hypothesis of *vortices*), a translation of Van Dale's *History of Oracles*, in which and in his *Doutes sur le Système Physique des Causes Occasionelles* (of Malebranche) there is much covert scepticism, were the chief products of his pen down to 1688, when his *Poésies Pastorales* appeared. These were highly artificial in tone, and by no means justified his hard words against the great poets of antiquity. In 1699 he became perpetual secretary to the *Académie des Sciences*, of which he wrote a history; and during the next forty years he composed and pronounced those *Éloges des Académiciens*, which are the real monument of his literary fame. The range of knowledge required for the task may be inferred from the fact that the list includes Vauban, Malebranche, Leibnitz, Newton, Boerhaave, &c. His judgments, generally just, are always expressed with marvellous clearness and grace. He died in his hundredth year at Paris, 9th January, 1757, a living connection between the 17th and 18th centuries of French literature. F.'s *Œuvres Complètes* have been frequently published, the best edition being that of Paris (1818).

Fon'tenoy, a village (pop. of commune 703) in the department of Yonne, Burgundy, France, 18 miles S.W. of Auxerre, has, among several places of the same or similar name in that department, the best claim to be considered the old *Fontanetum* or *Fontanidus in pago Ætiodorensi*, where, on the 25th July, 841, was fought the memorable battle between the sons of Hlodowig the Pious, which finally severed the connection between the Western and Eastern Franks and from which we begin to date the separate existence of 'France' and 'Germany.'—F. is also the name of a village in the province of Hainaut, Belgium, 4 miles S.E. of Tournay, where was fought 'the battle of F.,' a decisive contest in the war of Austrian succession, in which the French under Marshal Saxe, defeated the English, Dutch, and Austrian allies, 11th May, 1745. The forces were each some 60,000 strong, and the total loss amounted to about 7000 men. Pop. of commune 818.

Fonte'vrault (*Fons Ebraldi*), a small town in the department of Maine-et-Loire, France, 35 miles S.E. of Angers. It was formerly the seat of a celebrated abbey, the nucleus of the rich, influential order of F., founded by a Breton monk, Robert d'Arhissal, in 1099. The rule of the order was that of Benedict, but the monks were placed under abbesses, who were generally of illustrious family. In the 18th c. it had lost much of its wealth and power, but even at the time of the first French Revolution, when it was abolished, it held fifty-seven priories. The abbey is now occupied as a central prison. At F. are the tombs of the English Henry II., of his queen Eleanor of Guienne, and of Richard I. Pop. of commune 2698.

Fontina'lis, a genus of *Musci* or mosses distinguished by possessing the fructification within the leaves. The best-known species is the greater water-moss, found growing on rocks and stones in the neighbourhood of water.

Food is whatever goes to the building up of the tissues and substance of a living being, and enables it to perform its necessary functions of life. All organisms, vegetable and animal, have their proper food which is essential to their existence. As a rule, vegetables build up, from the unorganized elements of the mineral kingdom, those compounds which serve for the nutrition of the animal kingdom. Animals, on the other hand, by feeding on the substances thus elaborated, decompose them, and return their constituents to the mineral kingdom; and thus the cycle of inter-dependent existence continues. Animals are classed according to their diet, as graminivorous or vegetable-eating, carnivorous or flesh-feeding, and omnivorous or eaters of both vegetable and animal F.; but primarily all animal F. is obtained from the vegetable world, carnivorous creatures only taking it at second-hand through the bodies of the animals on which they prey.

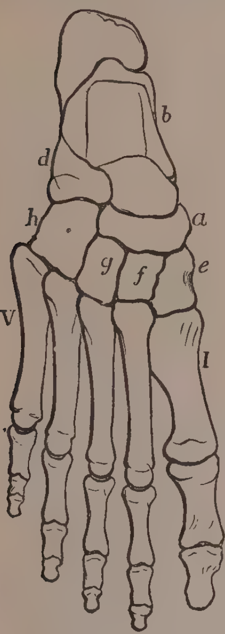
Human F. is frequently classified in a popular way under the two heads, F. and drink, which are regarded as functionally distinct, but such a subdivision is altogether fallacious, as there is no physiological or chemical ground to warrant the separation. Man is of all animals the most thoroughly omnivorous, drawing his F. from an endless variety of sources, and this he further varies indefinitely by cooking and compounding in every fashion that art can suggest. Notwithstanding this incalculable variety, the F. of man, as of every animal, is composed essentially of a limited number of alimentary principles. Analysis shows these principles to be—(1) Nitrogenous compounds, represented by casein in milk, and analogous substances found in cereals, peas, beans, &c., with a small proportion of albumen and other albuminates; (2) fat or butter; (3) a carbo-hydrate; (4) water; and (5) saline substances or ash, consisting of combinations of calcium, magnesium, sodium, &c., with chlorine, phosphoric acid, and other acid substances. Each of these five classes must be represented in every proper form of diet, and for the purpose of adequate nutrition they must be consumed in certain proportions, varying with conditions of climate and habits of life. The peculiar function of each has, however, not yet been definitely determined. The nitrogenous substances, the fats, and the carbo-hydrates, become oxidized within the human body, and are thrown out as effete matter in the form of urea and carbonic acid. In becoming oxidized they give off within the human body the stores of energy which they contained, and that energy is manifested as vital heat, nerve and muscular action, &c. Water and saline substances, and the oxygen of the air inhaled by the lungs, are essential as oxidizing agents. In addition to these principles there are, however, a variety of other substances taken into the human body, the functions of which obviously do not depend upon their being oxidized. They are various in their constitution, and are to be regarded as regulating the nutrition, or as having certain specific auxiliary or medicinal effects upon the essential ingredients of F. All kinds of F. thus come under one or other of the following heads, which are modified from a physiological and chemical classification of F. drawn up by Huxley and Frankland:—Class I., Alimentary or necessary F. containing the five groups given above; and Class II., Medicinal or auxiliary F., subdivided into four groups, namely—(1) alcoholic substances, represented by beers, wines, and spirits; (2) spices and condiments, containing volatile oils, such as pepper, cinnamon, cloves, nutmegs, and mustard; (3) acid substances, such as apples, oranges, rhubarb, &c.; and (4) substances containing alkaloids or special active principles which act upon the nervous system as stimulants or sedatives, a most important group, embracing tea, coffee, and cocoa, with the various narcotics habitually indulged in by almost all races of mankind. See COOKERY DIETETICS.

Fool. See COURT-FOOL.

Fools, Feast of (Lat. *Festum Stultorum*, *Festum Fatuorum*), was a festival instituted by the early Christian Church to take the place, in the people's regards, of the Roman Saturnalia (q.v.) or New Year festival. The great peculiarity of that festival, besides an unbounded extravagance of merriment, was that while it lasted all the ordinary conditions of society were reversed, *e.g.*, slaves taking the place of their masters, arrayed in their clothes, and waited upon by them. And a similar inversion of the ordinary relations between the clergy and laity formed the principal feature in the F. of F. The festival extended from Christmas to the last Sunday of Epiphany, but the chief celebration was on Innocents' or New Year's Day. At first only the choristers took part in the ceremonies of the day, which consisted of the performance, with mock solemnity, of the ordinary religious rites, while the clergy formed the audience or part of it. But latterly all the servants of the Church, and even laymen, took part, and as time went on extraordinary license was introduced. A president being elected under the name of Pope of Fools, Archbishop of Dolts, Abbot of Unreason, Lord of Misrule, &c., the performers repaired to the church, where, dressed in the priests' vestments outside in, they read prayers from books turned upside down, with spectacles of orange-peel, and burned an old shoe or filth in the censer; or, not sparing even the Church's most sacred rite of the Mass, ate sausages and puddings off the altar, or played at dice upon it. During and after the mock service, the church, which was thronged with a motley crowd of spectators, was a scene of the wildest riot and confusion, the maskers leaping and dancing like madmen, and singing obscene songs, some of them being dressed up as dragons, hobby-horses, &c. Long before the Reformation the F. of F. had become such a scandal from the way in which everything sacred was turned to ridicule, that the clergy, who had themselves set the stone rolling, did everything in their power to put a stop to it; but all their attempts were unavailing, till the institution got its death-blow at the Reformation.

Fool's Pars'ley, a species of poisonous *Umbelliferæ*, so named from its producing narcotic symptoms, and from its having been sometimes eaten in mistake for Parsley (q.v.). F.P. is a common British weed. It is distinguished from other and allied *Umbelliferæ* by its flowers having deflexed *involucres* or circles of *bracts*. Probably, as is the case with 'dead-tongue,' a near ally of F.P., the poisonous properties of the plant depend greatly on the locality and mode of growth.

Foot. This important part of the body is formed of (1) the tarsus; (2) the metatarsus; and (3) the phalanges. The *tarsus* is composed of seven bones, namely, the os calcis (*d*), astragalus (*b*), cuboid (*h*), scaphoid (*a*), and the three cuneiform, internal (*e*), middle (*f*), and external (*g*). The astragalus articulates with the lower end of the tibia and fibula. The *metatarsus* is formed of five bones (I. to V.), which are shafted bones, like those forming the metacarpus, or palm of the hand. The *phalanges* are attached to the extremities of the metatarsal bones, and are usually numbered first (1), second (2), and third (3), from behind forwards. It will be observed that the great toe has only two phalanges. Structurally the F. is an arch supported on three piers, two in front and one behind. The posterior pier of the arch is formed by the heel, and the anterior piers by the balls of the great and of the little toes. The weight of the body is transmitted to this arch from the tibia to the astragalus. The F. is also slightly arched transversely. These characteristics of the F. of man adapt it to the support of the body in the erect position, and to biped progression. It wants the prehensile power seen in the F. of the anthropomorphic apes. On the whole the human F. is, in proportion to the size of the whole body, larger, broader, and stronger than that of any other mammal save the kangaroo. The plane of the F. is at right angles to that of the leg, its sole is concave, its great toe is usually unopposable, and the upper surface of the astragalus looks almost vertically upwards. All of these peculiarities distinguish the F. of man from that of the ape. The great toe, though in man one of the largest digits, is rudimentary or entirely absent in many mammals. In climbing animals it is considerably developed, and has prehensile characteristics, as in the gorilla and orang.



Bones of the Foot.

Foot, a measure of length, in almost universal use, and doubtless derived from the length of the human foot. The numbers expressing the length of the English foot in terms of the corresponding measures in other European countries and states were as follow:—Austria, ·964; Baden, 1·016; Bavaria, 1·044; France (Paris F.), ·938; Prussia and Denmark, ·971; Russia, 1; Saxony, 1·076; Würtemberg, 1·064. The metrical system is now followed in most countries. An English mile contains 5280 English feet. The actual length of the English F. is the distance between two gold pins in the bronze bar, called 'Bronze 19, No. 1,' which is measured when the bar is at a temperature of 62° Fahr. The F. of the U.S. of America was taken from the old English standard.

Foot, in organ-building, is sometimes used to qualify the word *tone*, as '4-foot tone,' '8-foot tone,' &c. It here indicates the length of an open organ-pipe which would produce the required sound. Thus middle C is 2-foot tone, &c. The expression '4-foot,' '8-foot,' &c., applied to an organ-stop indicates the length of the lowest C pipe in that stop.

Foot-and-Mouth Disease (synonyms, *Eczema contagiosa* or *E. epizootica*, *Epizootica Aphtha*, and *Murrain*), a contagious disease of a febrile nature, chiefly affecting cattle and sheep, and characterized by the presence of a vesicular eruption in the mouth, between the toes, and around the coronets. The mouth or feet alone may be affected. In cows, the eruption may extend to the mammary gland, and necessarily affects the milk. Pigs, poultry, dogs, and more rarely man, are subject to F.; but horned cattle are the chief sufferers. The temperature first increases, and a vesicular eruption appears after an incubatory period of from three to four days. The animal exhibits great restlessness and uneasiness; saliva runs from the mouth, and a watery discharge from the eyes. The disease is one of a specific type caused by the presence of a specific poison. Pasture lands receive the contagious material or virus, and the disease thus spreads. One attack is not a protection against a subsequent attack, but the animal is usually attacked only once in a season. Microscopic examination of the discharges has as yet failed to detect any specific form of fungus or other parasitic organism which might be credited with causing the disorder. The febrile symptoms may cease in a week; but if the weather be unfavourable or the animals be exposed, a rough tracheal cough with expectoration may persist for a long time. The treatment consists in giving the animals plenty of cold water to drink, in which nitrate of potash (one ounce to a bucketful) may be dissolved. Soft food—mashes, &c.—should be given, and the sores on the feet should be dressed with a mild astringent solution—*e.g.*, by one ounce of carbolic acid lotion (made by adding one part of pure carbolic acid to sixteen of hot water) added to twelve ounces of white lotion or a solution of acetate of lead. Stimulants may be demanded in extreme cases of prostration, but bleeding and purging are carefully to be avoided. Sheep, as a rule, suffer most violently in the feet, and require more careful watching and treatment than cattle. An affected flock should be made to walk or wade once or twice daily through a shallow trough containing the solution of acetate of lead and carbolic acid above mentioned. Contagious diseases, such as pleura-pneumonia, sheep scab, F.-and-M. D., which affect animals, are now dealt with by various statutes with a view to preventing their spreading. Importation of animals from affected districts and countries may be forbidden, and animals affected must be slaughtered; and there are many other provisions.

Foot'ball, a popular national sport, played during the winter months in the British Isles, but all the year round in many of our colonies. There are two distinct types of game played, and some public schools in England have their own peculiar modifications. Both types make use of a ball and two goals, each of which consists of two upright posts with a cross-bar or tape at the height of about ten feet. The goals are placed at the extremities of the course, which has fixed boundaries. If the ball is sent beyond these boundaries it is for the time out of game, and must be returned according to rule. In the *Association* game, the ball is round, and must not on any account be touched with the hand, except by the goal-keeper of each side or when it is 'dead.' One goal is scored when the ball is sent through the posts beneath the tape, each side working the ball towards the adversary's goal. In the *Rugby* game the ball is oval; and any player, if *on-side*, is entitled to catch or pick up the moving ball, and run with it towards the adversary's goal. If stopped, however, he has to relinquish the ball, and put it *down* to ground, when a *scrimmage* takes place, each side striving to drive it through towards the other's goal. A goal is won when the ball is kicked *over* the cross-bar between the goal-posts or the goal-posts produced. International matches, between chosen teams of English, Scotch, Welsh, and Irish are yearly played according to both Association and Rugby rules, and excite great interest in F. circles.

Football is a very ancient game, and seems to have been as widespread as it was popular. But, although reference is made to it in the Greek classics, the writers have not handed down to us any information concerning the rules under which it was played. We know that a game somewhat resembling F. has been popular for centuries among the Malays, and that another, in some way a combination of cricket and F., has been a pastime among the Esquimaux from time immemorial. In the reign of Edward II. F. would appear to have rivalled archery in its attraction both for men and boys. Not a hundred years ago in some of our counties an inter-village F. match was an annual affair, at which all the villagers, headed by the parsons, assembled at some central position between their villages, where the ball was 'kicked off,' and forthwith *en masse* strove their very uttermost to force it through hedges and streams, across fields, woods, and ditches, towards the goal posts, to wit, the churchyard of their opponents. Then there were no such terms as *offside, time, umpire, referee, touch, back, half-back*, &c., for the game, as thus played, recognised no such paltry distinctions as to whether a player lay up too close beside his opponents' church steeple with no adversary between him and the churchyard; as to time, the ball was started soon after early breakfast and it must have been a bad business indeed if neither side should prove the stronger before sun-down. The presence of the clergy in the ranks of the players was understood to be sufficient guarantee of fair-play on both sides, and therefore neither umpire nor referee was required; and as for expecting a man to keep to one particular part of the field when the field could be measured by miles and contained every possible natural obstacle; why, the bare idea of such a thing would have been laughed to scorn, had anyone ventured to suggest it, and that indeed with much reason, as the course taken by the ball was as uncertain as it was wide, and might upon occasion even extend into a neighbouring parish, whereupon the outraged inhabitants of the third village would at once join issue and the game, already somewhat confused, would become still more confounded.

Until 1870 few clubs existed besides those at the larger public schools and universities. But in 1871-72 the English F. Association Cup was offered as a prize, and forthwith F. clubs started up on all sides. In 1873-74 competitions became an established fact in Scotland, and Wales followed the example in 1877-78, and Ireland in 1879-80. The principal schools where the rules were nearest to those adopted by the Association were Westminster, Charterhouse, and Harrow; and, perhaps, Eton should also be included, although the game at Eton, quite apart from the *wall*, is peculiar to the school and not played anywhere else except among old Etonians.

In the North and Midlands professionalism was soon introduced, and though the south country clubs opposed the practice of paying players for services rendered, the practice spread and has now become general, with, it is to be feared, most injurious effects upon F. as a game and a pastime, since it has become more or less a purely business transaction, and the best professional assistance may be obtained by the clubs that offer the highest salary. That the skill of the players has become greater since men took to the game as a livelihood, no one can well deny, but F. of all athletic games is, in our opinion, the best able to dispense with *mercenary* help, and the sooner the clubs all round view the matter in the same light, the better, we venture to think, for F. At the present time there is no more popular game than F. among our Indian, Malay, and Chinese fellow subjects. The last-named have developed considerable skill at the game and are now competing with other local clubs, Indian and European, and that often successfully. The Malays are very expert in kicking, and will pass a 'wickerwork' football from one to another, in a party of six and more, for a long time without touching the ball with the hand and without letting the ball fall to the ground.

Foote, Andrew Hull, rear-admiral in the American navy, was born at New Haven, Connecticut, 12th September, 1806. He entered the navy 4th December, 1822, became a commander in 1852, and a captain in 1861. In February, 1862, he received the command of the western flotilla, took Fort Henry, on the Tennessee River, without waiting for the land co-operation of General Grant, attacked Fort Donelson, where he was wounded, and on 7th April took Island No. 10. He received the thanks of Congress, and was made rear-admiral in July, 1862. F. was appointed to relieve Admiral Dupont, at Charleston, but died at New York, 26th June, 1863. Admiral F. was not only a gallant, chivalrous naval officer, but a man of singularly strong moral character. He wrote *Africa and the American Flag* (1854) and *Letters on Japan* (1857).

Foote, Samuel, a famous English wit and dramatist, was born at Truro, Cornwall, in 1720, and entered at the Temple, but finding the law uncongenial, went on the stage, and made his *début* as Othello in 1744. He was a comic writer as well as an actor, and led a brilliant and dissipated life, until in 1766 he lost his leg by falling from his horse. This misfortune did not extinguish his mercurial gaiety. He appeared in parts which turned the want of his limb to stage account, and remained to the last recklessly improvident and irresistibly vivacious. He died at Dover, 21st October, 1777. F. was an admirable mimic, and the cleverest manufacturer of *bon-mots* of his day, but many of his witticisms are vulgarly broad and personal, and would no longer be tolerated in society. Among the pieces are some of the most amusing farces in the English language, but it is a sort of profanity to call him 'the modern Aristophanes.' A collection of his dramatic works appeared at London (1778-97). They were translated into German (Berl. 1796-98). See Clarke's *Memoirs of Sam F.* (Lond. 1805).

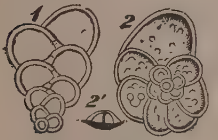
Foot-Guards. See GUARDS.

Foot-Pound is the work required to raise the weight of one pound through the distance of one foot at the surface of the earth; or it is the work which such a weight could perform in falling through the same distance in the same circumstances. The corresponding French unit of work is the *kilogrammètre*, which equals 7·233 foot-pounds.

Foot-Rot, a disease of sheep, characterized by the presence of cracks or fissures in the hoof, and by the subsequent appearance of ulcerated sores arising from the irritation consequent on the presence of dirt, sand, and other foreign particles. Occasionally the ulcerated action may proceed to a very great extent, the lesion being then termed 'foul-foot.' The milder forms of F.-R. appear to arise from unequal development or wearing of the hoof, consequent on the sheep being enclosed in soft meadow-lands where the hoof is subjected to the least amount of attrition. But in the more severe forms, F.-R. is probably connected with, and arises from, constitutional causes; and in the latter case, great attention to the general health is necessary, as well as the adoption of local treatment. The latter consists in the use of astringents and caustics where the ulceration is of any great extent. In mild cases, tar is a safe application, and butter of antimony, or a paste of flowers of sulphur and sulphate of copper in equal weight mixed with lard, is also to be recommended as useful in this complaint.

For'age (Low Lat. *foragium*, from the Goth. *fodur*, 'fodder'), the food of horses. In the army, field-officers, surgeons, and adjutants of infantry regiments receive an allowance in lieu of F. for every horse allowed by the regulations. The ration allowed for horses is 10 lbs. oats, 12 lbs. hay, and 8 lbs. straw in barracks; and 8 lbs. oats, 18 lbs. hay, and 6 lbs. straw in quarters. The troops in Great Britain and Ireland are supplied with F. under contract entered into by the commissariat department. The forage, paillasse, straw, and stable allowance provided for in the Estimates for 1895-96 is £436,000 for both the home and colonial services.

Foraminif'era (Lat. *foramen*, 'an opening,' and *fero*, 'I carry'), an order of *Protozoa* (q.v.), or lowest animals, included in the class *Rhizopoda* (q.v.). The F. are distinguished by the possession of a shell or test of carbonate of lime, although the structure may occasionally be composed of sandy or *arenaceous* particles. Through holes or *foramina* in the shell the soft protoplasmic matter of their bodies can be protruded in the form of delicate interlacing filaments or *pseudopodia*. From the interlacing nature of these filaments, the name *Reticulosa* was given to the F. by Dr. Carpenter, who described the appearance of the pseudopodia as resembling 'an animated spider's web.' These filaments are used for grasping food-particles, and also subserve locomotion. In some cases (*e.g.*, *Miliola*) the pseudopodia are emitted, not through foramina, but by the mouth-opening or single aperture of the shell. The shells of F. have been divided into (*a*) the *porcellanous*, or those in which there are no foramina in the shell-wall; (*b*) the *arenaceous* shells, consisting of sandy particles; and (*c*) the *vitreous* or *hyaline* shells, which are glassy, transparent, and have their walls perforated. The shells of F. may be also divided into those consisting of a single chamber (*Monothalamia*), and those composed of many chambers (*Polythalamia*). The latter are originally single-chambered, and are produced by budding. If the budding of new segments proceeds in a straight line, a shell like that of *Nodosaria* is produced; whilst the spiral form of this process gives rise to a test like that of *Rotalina* or of *Discorbina*, &c. The shell-wall of F. appears to be perforated by a system of canals in addition to the foraminal apertures. The living matter of their bodies is of the simplest character, their protoplasm being destitute even of the nucleus and other structures found in most *Protozoa*. The F. are for the most part of microscopic size, and require the microscope for their investigation and recognition. Some extinct forms—notably the Nummulites (q.v.) —attained a larger size, the latter being found as large as a shilling, and frequently attaining even larger dimensions. The F. are found in the present day in waters of the sea, and in the bed of all our oceans, and most notably in those areas traversed by warm currents. Their shells form a thick layer of calcareous matter in the sea-bed. True chalk is a Foraminiferous deposit which was formed in this way in an ancient sea-bed. F. first appear as fossils in the Laurentian rocks where *Eozoon* (q.v.) is found. They occur in all the stratified formations up to the present day. Some species (*e.g.*, *Miliola* in Eocene rocks and *Nummulites* in the Middle Eocene) have attained a vast development in certain geological epochs.



Foraminifera.

1. Textiraria globulosa.
2. Rotalia globulosa.
2'. Side view of Rotalia boucana.

Forbach, a town of Alsace-Lorraine, about 11 miles N.W. of Saargemünd. The fight, which took place on the height of Spichern on 6th August, 1870, has been called by the French the battle of F. Steinmetz, and Prince Friedrich Karl defeated the French under Frossard, and since then the town has been held by the Germans. The neighbourhood is rich in coal. Pop. 9580.

Forbes', Duncan, of Culloden, one of the ablest and best men that Scotland has produced, was the second son of the proprietor of the estate of Culloden, and was born at Bunchrew—another estate belonging to the family—10th November, 1685. His father, a staunch Presbyterian, had suffered much at the Restoration, and finally received a strange compensation in the privilege to distil whisky, under a merely nominal duty, on a third estate called Ferintosh, which privilege he used so extensively that to this day, 'Ferintosh' in many parts of Scotland is synonymous with whisky. Duncan was sent to Edinburgh University when nineteen years of age, and lost his father the same year. Next year he was sent to Leyden, where he studied both law and Oriental languages. He returned home at the end of two years, passed as advocate in Edinburgh, was, through the influence of the Duke of Argyll (both a patron and a relation), appointed sheriff of Midlothian, and married Mary, a daughter of Rose of Kilravock. In 1715 he exerted himself to the utmost in suppressing the insurrection headed by the Earl of Mar; and when it was brought to a close, he showed the most active kindness in mitigating the fate of the unfortunate prisoners, who were treated with utmost rigour by the Government. He collected money for their defence, and publicly remonstrated with the Government on the cruelty they displayed. Some time after he proposed the plan, which Pitt sixty years later adopted with entire success, for the pacification of the Highlands, viz., restoring to the chiefs their forfeited estates, and employing the people in the service of the country. In 1716 F. was appointed depute to the Lord Advocate; in 1722 he was returned to Parliament for the Inverness burghs, and three years after was raised to the office of Lord Advocate. While in London he was on intimate terms with Lords Mansfield, Lyttelton, and Hardwicke, as well as Sir R. Walpole, and was a valued member of the literary society in which Pope, Arbuthnot, and Swift held sway. In 1734, owing to the death of his elder brother, he succeeded to the family estate, and in 1737 was appointed President of the Court of Session. According to his best biographer, Dr. Hill Burton, he effected a thorough and most beneficial change in the proceedings of this court, having raised it to a state of efficiency which it has never surpassed. But it was in connection with the rebellion of '45 that he rendered the most important services to the state. The members of the Government were singularly destitute of all resource, and for a length of time anything that was done in Scotland to save the country was mainly the work of Forbes. He kept the more reasonable of the Jacobites from rising, especially the great MacDonald and MacLeod clans in Skye and the islands, who themselves could have brought 8000 men into the field; and having restrained these, he may be said in a certain sense to have saved the Hanoverian throne. He gave not merely his great influence to this work, but he expended on it all the money he could raise, straining his credit to the utmost, yet the Government refused to repay him any portion of what he thus expended; and he died 10th December, 1747, pressed by creditors whose claims he was unable to meet. Bishop Warburton calls him 'one of the greatest men that ever Scotland bred, as a judge, a patriot, and a Christian.' See Hill Burton's *Life of Duncan F.*

Forbes, Edward, a British naturalist, was born at Douglas, in the Isle of Man, 12th February, 1815. At an early age he showed a bent towards the natural sciences, and when only seven had made a small collection of zoological and botanical specimens. In 1831 he entered Edinburgh University as a medical student. Here he studied till 1839, ultimately concentrating his whole attention on botany, zoology, and geology, to the exclusion of medicine, adding meanwhile to his stores of knowledge by excursions to Norway, the Alps, Austria, Algeria, and Southern Europe. In 1834 he became a member of the British Association, and in 1836 was one of the founders of the Edinburgh Botanical Society, to both of which he contributed many valuable papers and reports. In 1841 he accompanied the *Beacon* in its surveying expedition to Asia Minor as naturalist, and from numerous dredging operations showed that the laws of geographical distribution in the depths of the sea were similar, and depended upon conditions similar, to those which held on land. On his return in 1842 he found that he had been elected Professor of Botany at King's College, London. In 1844 he became curator of the museum of the Geological Society, and palæontologist to the Ordnance Survey. In 1853 he was President of the Geological Society, and in May, 1854, succeeded Professor Jamieson in the natural history chair at Edinburgh. This position he filled with great ability for only one short summer course, since his death occurred on 18th November of the same year. The peculiar merit of F. lay in his wide grasp of the whole range of the natural sciences, no one department being his peculiar study to the relative exclusion of the others. To a quick perceptive faculty of observation, and a retentive memory, he added a rare power of abstraction and generalisation, which is perhaps best displayed in his beautiful theory of the derivation of the present flora of the British Islands. His chief works are a *History of British Starfishes* (1841), *Travels in Lycia, Milyas, and Cibyratis* (1846), and, with Hanley, a *History of British Mollusca* (1850-53); but his great services to science can only be estimated from a consideration of his numerous memoirs on the classification of medusæ, mollusca, &c., on geographical distribution, and on subjects connected with every phase of natural science, all of which teem with novel and accurate information of varied description. He also drew up the valuable maps on distribution in Keith Johnstone's *Physical Atlas*. See *Memoir of Edward F.* by G. Wilson and A. Geikie.

Forbes, James David, was born at Edinburgh, 20th April, 1809, and passed most of his early life at his father's residence at Colinton, where he received private tuition along with his brother Charles. From 1825 to 1830, with the break of one year, he studied for law at Edinburgh University, devoting every spare moment, however, to astronomy, meteorology, and the physical sciences. In 1833 he threw up all legal pursuits, and was elected the successor of Sir John Leslie in the chair of natural philosophy at Edinburgh, a position which he resigned on account of failing health in April, 1860, four months after he had become Principal of the United College in the University of St. Andrews. He died at Clifton, 31st December, 1868. F. was a member of numerous scientific societies at home and abroad, and received the Royal and Rumford medals from the Royal Society of London, and two Keith medals from the Royal Society of Edinburgh, for his contributions to science. The most important of these are the discovery in 1836 of the polarization of heat by refraction and reflection, the subsequent investigations in its refrangibility and depolarization, the observation in 1846 of the conditions of temperature at different depths in the soil, and experimental inquiry into the laws of thermal conduction in metal bars in 1861 and 1865, besides numerous valuable papers on climate, meteorology, and geology. His most famous work, however, is in connection with the motion of glaciers. The results of his investigations (see GLACIERS) are given in his *Travels through the Alps* (1843), *Norway and its Glaciers* (1853), *Tour of Mont Blanc and Monte Rosa* (1855), and *Occasional Papers on the Theory of Glaciers* (1859). These works display at once his high faculty as an observer of natural phenomena, his rare skill as an experimentalist, and his literary power as a graceful and lucid writer. His *Life and Letters* has been published since his death.

Forbes, Sir John, a very able and successful physician, was born 18th October, 1787, at Cuttlebrae, Banffshire. Educated at the universities of Aberdeen and Edinburgh, he was first a naval surgeon, but leaving the service in 1816, graduated at Edinburgh, and practised as a physician there, in Chichester, and finally in London, where he rose so much in favour with society that he was knighted and became Physician in Ordinary to the Queen in 1853. His death took place at Whitechurch, Oxfordshire, 13th November, 1861. F., besides being a very successful practitioner of medicine, was a zealous man of science. He may be said to have introduced the stethoscope into this country, was one of the editors of the *Cyclopædia of Practical Medicine* (1835), translated the works of Auenbrugger and Laënnec on auscultation, helped to found the British Medical Association, and started the *British and Foreign Medical Review*, editing it for twelve years. Among the other works of F., who during his latter years was one of the most distinguished and popular members of his profession, may be mentioned his *Physician's Holiday* (1849), and *Nature and Art in the Cure of Diseases* (1857).

Forbes, Sir William, Bart., of Pitsligo, was born at Edinburgh, 5th April, 1739, became a partner in the bank at Edinburgh of Messrs. J. Coutts & Co. in 1761, and in 1773 rose to be head of the eminent firm of F. Hunter & Co., eventually converted into the Union Bank of Scotland in 1830. He purchased the estate of Pitsligo, forfeited by Lord Forbes during the rebellion of '45, and erected the village of New Pitsligo. Often residing in London, he was one of the earliest members of the Literary Club, along with Johnson, Burke, Reynolds, &c. He wrote a life of his friend Dr. Beattie, printed with a 4to edition of his works in 1805, and the *Memoirs of a Banking House*, published in 1860. His nobility and rectitude of character are happily delineated in one of the introductions to *Marmion*. He died 12th November, 1806.

Forbes Macken'zie Act. This is the title of a very stringent 'Act for the better regulation of public-houses in Scotland' (Statute 16 & 17 Vict. c. 67). It is so named after the author of the measure. It continues the classification of spirit-dealers, as under former statutes, into (1) inn or hotel keepers, (2) public-house keepers, and (3) grocers and provision dealers. The sale of spirits in the first class is only permitted between eight o'clock in the morning and eleven o'clock at night during week days, except to *bonâ fide* travellers and lodgers. On Sunday the sale is prohibited except to lodgers and *bonâ fide* travellers. The same regulations apply to the second class, without any exception in favour of lodgers or travellers. No certificate is allowed to be granted to any grocer or provision dealer for the sale of excisable liquors to be 'drunk on the premises,' if in these premises a sale is carried on of provisions to be consumed elsewhere. This latter class is also prohibited from keeping their premises open on Sunday, and from any sale of liquor between eleven at night and six in the morning. These are the leading provisions of this Act, which has given rise to so much vehement controversy N. of the Tweed. The supporters of the Act have cited voluminous statistics, which they contend prove that the Act has diminished drunkenness in Scotland. Its opponents, again, by a different manipulation of the figures, maintain that these statistics show a contrary result, and that even if they do show an apparent diminution in Sunday-drinking, the fact proves nothing; because to diminish public drinking on Sunday is only to increase drinking in private and in illicit houses. And public drinking, they maintain, is the smaller evil of the two; because it is better, they hold, that people should drink where the law can take cognisance of them than in places where it cannot. A bewildered public is thus almost led to acquiesce in Sydney Smith's celebrated dictum, that, except facts, there is nothing so misleading as figures. A Royal Commission was appointed in 1859 to inquire into the working of the Act. Its report, with two large volumes of conflicting evidence, threw little light on the vexed question. The *bonâ fide* traveller has also been a source of infinite perplexity to magistrates. The Act has been in some degree amended by Statutes 25 & 26 Vict. c. 35, and 50 & 51 Vict. c. 38.

Forbidd'en Fruit, a species of the genus *Citrus*, belonging to the *Aurantiacea* or orange order, also known by the name, 'Adam's apple.' The Shaddock (q.v.), another species of *Citrus*, is sold under the name of F. F. in the shops. F. F. is common on the Continent, and appears to have been originally brought from China. The fruit is pear-shaped and has an irregular surface. The rind is thick, and constitutes the chief part of the fruit, the pulp being present in small quantity, and of an acid taste. The name F. F. has been occasionally given to the fruit of the *Tabernæmontana dichotoma* of Ceylon, a plant nearly allied to the cow-tree of Demerara, both species belonging to the Dogbane order (*Apocynaceæ*).

Force, according to Newton, is any cause which alters or tends to alter a body's state of rest or of motion; and the change of motion is proportional to the impressed force, and takes place in the direction in which the F. acts. (See MOTION, LAWS OF.) This at once gives a method for measuring F., and implies that forces are to be composed and resolved in precisely the same manner as velocities, or indeed as any directed quantities. (See QUATERNIONS.) Now, change of motion is an evidence of a transformation of energy from a less to a more apparent form, and is the direct consequence of such a transformation, so that our definition leads us to regard F. as merely a convenient term for transformation of energy, and as having, therefore, no objective reality. When the effects of forces acting on a material system mutually balance, the result is equilibrium, and the study of this branch of dynamics is called Statics (q.v.) See ENERGY.

Force and Arms were words always inserted in an indictment and formally inserted in a declaration for trespass, but have been rendered unnecessary since the passing of the Common Law Procedure Act of 1852.

Forcelli'ni, Egid'io, an eminent Italian lexicographer, was born near Padua, 26th August, 1688. Although his education was so much neglected that he had almost reached manhood before he commenced regular study at the seminary of Padua, his industry and abilities soon attracted the attention, and secured him the lifelong favour, of Facciolati, its chief. The two co-operated in the production of a great Latin dictionary, entitled *Totius Latinitatis Lexicon Consilio et Cura Jac. Facciolati, Opera et Studio Æg. Forcellini Lucubratum* (4 vols. Pad. 1771). F. died at Padua, 4th April, 1768, three years before the publication of this great work. Various editions of it have since appeared, the most complete being that of Furlanetto (Pad. 1828-31). It is the basis of all later lexicons of the Latin tongue, and is really a splendid treasury of scholarship and skill. Two new editions have appeared in Italy, that of Corradini (1859 *et seq.*), and De Vit (1860 *et seq.*).

For'ceps (Lat.), in surgery, are pincer-like instruments used for seizing, cutting, or removing substances that cannot be readily got at by the fingers. A complete set of F. are employed in tooth-drawing. Special kinds are required for securing a bleeding artery, extracting bullets, cleansing internal sores, &c. Bones of great thickness can be cut by Liston's F.

For'cible En'try, in English law, is the public offence of violently taking or keeping possession of land or of a tenement without legal authority. Both a civil and a criminal offence are committed by the offending party. The corresponding Scotch law terms are Ejection and Intrusion (q.v.).

For'cing, in horticulture, consists in stimulating the vegetation and growth of native or acclimatized plants at seasons other than their natural period of activity. It is practised by the application of artificial heat in hothouses and F. frames, and is resorted to in order to obtain fresh vegetable products in succession during periods when they cannot be procured by cultivation in the open air. In Great Britain F. is extensively prosecuted for obtaining early crops of culinary plants and vegetables, such as rhubarb, potatoes, and green peas. The strawberry, tomato, melon, and cucumber are also forced, besides vines, peach-trees, &c.

Ford, John, an Elizabethan dramatist, was the second son of a Devonshire gentleman, and was born at Ilsington, N. Devon, in 1586. He entered at the Middle Temple in 1602, and in 1606 published *Fame's Memorial*, an elegy on the Earl of Devonshire. He was never called to the bar. As a dramatist he produced *The Lover's Melancholy* (1628), a beautiful romantic comedy; *The Broken Heart* (1633), a tragedy of intense power, which is one of F.'s greatest works; *Love's Sacrifice*, a tragedy (1633); *The Chronicle Historie of Perkin Warbeck* (1634), an historical drama; *The Fancies Chaste and Noble*, and *The Lady's Trial*, comedies (1638). F. was a part author with Dekker, and probably with Rowley, in the domestic tragedy entitled *The Witch of Edinarton* (1623), and his masque *The Sun's Darling* (1624) was seemingly founded on Dekker's *Phaeton*. He appears to have retired to his birthplace before his death in 1640. The genius of F. is profound and sombre, but limited. He is wanting in variety, ease, and lightness; of humour and wit he has almost none, his comic scenes being the grossest and most tedious in the Elizabethan drama. As a tragic poet, however, he depicts passion with unerring subtlety and thrilling force. F.'s language is pure and vigorous; his verse has neither the effusive sweetness nor the charming felicities of Fletcher's; it is limpid and equably musical, though at times somewhat hard and unspontaneous. See *The Works of F.* by Gifford, Swinburne's *Essays and Studies*, Minto's *English Poets*, and Ward's *English Dramatic Literature*.

Fords (from Old Eng. *faran*, 'to go,' hence 'to cross') are shallow parts of a river, which can be crossed simply by wading, without the aid of a bridge or a boat. They are of special importance in military operations; and in choosing a ford, great consideration must be given to its position, its depth in relation to the flow of water, the nature of its bottom, and the manner in which it may possibly be affected by changes of season, &c. For infantry the depth should not exceed 3 feet, and for cavalry 4 feet. Many of our towns, such as Oxford, Bedford, Bradford, Stratford, &c., indicate by their names their own origin, as well as the position of ancient and important F. now superseded by bridges.

For'dun, John of, a 14th c. chronicler, belonging (according to the slender authority of Camden) to Fordun, Kincardineshire, who is supposed to have died about 1385. He was probably a chantry priest of Aberdeen Cathedral. F. wrote what is now known as a *Scotichronicon*, or Chronicle of Scotland, tracing the history of the Scots from the times of Noah to 1153. He had collected additional materials before his death, which passed into the hands of Walter Bower, Abbot of Inchcolm, who carried the Chronicle of F. as far down as 1437, and whose work in 16 books, bearing the title of *Scotichronicon*, appeared between 1440 and 1447. A comparison of Bower's so-called 'Continuation' with the best MSS., especially with the Wolfenbüttel MS., has revealed the startling fact that Bower has so grossly tampered with the text of F. that the original is often unrecognisable and its character completely misrepresented. The best, indeed the only valuable, edition of F. is by Skene (Edinb. 1871) in the series of *The Historians of Scotland*.

Fore'castle (pron. *foks'le*), in a ship, strictly an elevated foredeck (see DECK) above the maindeck or the spardeck. Vessels are not frequently built with such a F. now, and the name is generally given to that portion of the fore part of the ship which constitutes the quarters for the crew.

Foreign Bill of Exchange. A bill is said to be foreign when drawn by a merchant abroad upon his correspondent in England, or the reverse; or when it is drawn and accepted abroad. Even England, Scotland, and Ireland were at one time so far foreign to one another that a bill drawn in any one of these countries on a person in any other was held to be a F. B. of E., but by statute 19 & 20 Vict. c. 97 any such bill has been held to be an *inland* bill. Formerly, foreign bills were held by the law to be more important than inland ones, but now they are on nearly the same footing. Every bill drawn in this country must be stamped, and a bill drawn abroad, if no adhesive stamp of *ad valorem* value be already affixed and cancelled, must be stamped before it is presented for payment or endorsed, or transferred, or negotiated, or paid. In enforcing a bill drawn and accepted abroad, the courts of the United Kingdom will hold that whatever relates to the nature of the obligation—*ad valorem contractus*—is ruled by the law of the country where the contract is made, but that the mode of remedy is according to its own forms. The holder of a F. B. of E. is bound to protest when the bill is not paid, or is not accepted so soon as the acceptance may have become necessary. See BILL OF EXCHANGE.

Foreign Debts, Recov'ery of. See DEBTS, RECOVERY OF; ENGLISH DEBT.

Foreign Enlist'ment Act. Under the statute of 1870, any British subject who, without the license of Her Majesty, enlists in the service of any foreign state at war with any friendly state, or who induces another to do so, is guilty of an offence punishable by fine and imprisonment. The master or owner of any ship who takes illegally-enlisted persons on board, is guilty of an offence punishable in the same way. Penalties are also imposed on any one who, without Her Majesty's leave, builds, or agrees to build, any ship for the service of a foreign state at war with a friendly state. The Act gives special power to the Secretary of State for carrying out its provisions. It makes regulations with regard to foreigners enlisting in the Queen's service.

For'eigner. See ALIEN.

Foreign Law, Applica'tion of. It has been provided by statute 24 Vict. c. 11 that the High Court of Justice may remit a case with queries to the courts of foreign countries, with which a convention exists for that purpose. If no such convention exists between our country and that to the court of which the case is sought to be remitted, then no remission can take place. Should the case be remitted and the queries be answered, then the High Court may apply the information to the case before it.

Fore'land, North (the *Cantium* of Ptolemy), is a chalky headland, 184 feet high, in the N.E. extremity of Kent, 2 miles E. of Margate. It has a light visible at a distance of 24 miles.—**South F.,** a promontory, also of chalk, 16 miles S. of the N. F., and between Deal and Dover. It supports two lights, at an elevation respectively of 372 and 275 feet above the sea. Between the two Forelands are the Downs and the Goodwin Sands.—**Bloody F. or Farland** is the promontory on the N.W. of Donegal, Ireland, and stretches out to a distance of 38 miles.

Foreshort'ening, in painting and drawing, is the representation in correct perspective of an object presented obliquely to the eye, and the effect should be to give the object the appearance of projecting from the canvas. Cimon of Cleonæ was the first to apply the method to the human figure in any attitude, and in more recent times the art has been carried to perfection by Raphael, Angelo, Tintoretto, and Correggio.

For'est Fly, the name given to flies belonging to the family *Hippoboscidæ* of the *Diptera* (q.v.). In this family the head is distinct, the legs short, and the fifth joint of the tarsi longest. The wings are large, and the nervures or supporting ribs do not extend to the tip. The *horse F. F.* is the most familiar species. It receives its popular name from its inhabiting forests, and its specific name of *horse* from its attacking horses by means of its suctorial mouth. The F. F. is about one-third of an inch in length, and is of brown colour, with yellow markings on the thorax. The eggs are retained within the body of the female until the larvæ are hatched, and ready to pass into the pupa stage.

Forest Mar'ble, a local deposit in the southern and midland counties of England, belonging to the Lower Oolites of the Jurassic period, and overlying the Great Oolite group. It consists of hard limestones, marls, shales, and fine oolitic freestone, and contains numerous lamellibranch shells characteristic of this period.

Foresters, Ancient Order of, a very flourishing association, which may be described as a benefit society. In 1790 a Court of Foresters was opened at Leeds and was called Court No. 1, of the Royal Ancient Order of Foresters. In 1834 a split occurred in the association, which led to the founding of the A. O. of F. and the depression of the older body. In 1835 the first meeting of the A. O. of F. took place at Salford, and by that time 16,510 persons had been certified as members. In 1840 a Juvenile Foresters' Society was formed at Hull for funeral benefits only, but before then Forestry had been introduced into Canada and the U.S. of America, and had eminently thriven. The funds of the Order now amount to £5,266,824, and the list of members contains 724,375 male adults, 3657 female adults, 16,829 contributing widows, and 112,227 juveniles, besides 19,405 honorary members. The general meeting in 1895 took place at Brighton.

Forest Oak, a species of Australian trees, belonging to the *Casuarinaceæ* or beef-wood order. They are named beef-wood trees from the dark-red colour of their wood, which is hard and heavy, and used for ornamental upholstery.

Forests, Chas'es, Parks, and Warr'ens. By the common law of England, the possessor of land has the exclusive right to all the wild animals found upon it, and he may pursue and kill them. Besides the absolute right which the owner of land has over the soil, there may be a privilege of taking or killing wild animals to the exclusion of others, in virtue of a franchise to have a forest, chase, park, or warren. A forest is a royal domain for the preservation of the Queen's beasts and fowls of forest, and is subject to its own laws, courts, and officers. Before the *Charta de Foresta*, the sovereign could make a forest of any extent over the lands of his subjects. It is the highest franchise relating to game. There are sixty-nine forests in England, the three principal of which are New Forest in the county of Southampton, Forest of Dean in Gloucestershire, and Windsor Forest.

A *chase* is a franchise whose nature is between that of a *forest* and that of a park. It may be held by a subject, and is governed by the common, not by the forest, law. It is not enclosed, yet certain distinguishable bounds must be provided for it. A man may have the right of chase over the ground of another, with privilege to keep royal game on it, protected even from the owner of the land. There are, we believe, thirteen chases in England.

To constitute a *legal* park there must be a royal grant; it must be enclosed by pale, wall, or hedge, and it must be stocked with deer; and if the deer be all killed, it is no longer a legal park, which is composed of *best venison* and *enclosure*, and failure in one is a total disparking. There are in England 780 parks.

The *warren* is a place privileged by prescription or royal grant for the keeping of beasts and fowls of the warren, which are hares and rabbits, partridges and pheasants. Some add quails, woodcocks, and waterfowl. Twenty years' undisturbed exercise of a claim of a warren or park will afford presumptive evidence of right in the party who has exercised it for the period. The owner of a warren may lawfully kill any dog found injuring the warren.

The rights of any forest, chase, or warren are not affected by the Game Laws (q.v.). The franchises mentioned above may be destroyed by reversion to the Crown, or by surrender or forfeiture in consequence of a breach of the trust for which they were granted. In Scotland, lands granted by the Crown with a right of forestry carried all the privileges of a royal forest, which were very oppressive to the country, and accordingly the right was reprobated in 1680 by the Court of Session. Nevertheless, the pretensions of royal foresters have survived to present times. In 1862 the Duke of Athole, in virtue of his supposed right of forestry, claimed the right to prevent his neighbour, the Laird of Lude, from killing deer on his own lands, and maintained that he, the Duke, and his servants, were entitled to enter the lands of Lude and drive any deer found on them into the forest of Athole. Both points were decided against the Duke (1st March, 1862).

In England there were *Forest Courts*, which are now no longer held. They were courts of justice-seat (courts of *record* and where the cases were tried before the judge on circuit), seveinmote (courts of freemen), of attachments (verderers' courts), and of regard.

For'far, the capital of Forfarshire, in the valley of Strathmore or 'Howe of Angus,' near a small lake, 15 miles N.E. by N. of Dundee and 485 from London, by railway. It has a large parish church, with a spire 150 feet high, a handsome townhall, and a considerable manufacture of brown linen and 'brogues.' F., along with Montrose, Arbroath, Brechin, and Inverbervie (the Montrose District), sends one member to Parliament. It is supposed to be the ancient *Orrea*, and received a royal charter in the reign of David I. There was formerly a royal castle here. F. was a great place for hunting out witches, and the 'bridle' or gag, used at the burnings, is said to be still kept here. A dispute arose at one time between the inhabitants of F. and those of Dundee as to the ownership of the bell of the parish church. The silver clapper was lost and in order to obtain it the F. folk were compelled to purchase the ground it passed over between the Quay and the Dundee boundary. Pop. parl. and royal burgh 11,982; civ. town and royal burgh 12,057.

Forfar'shire, or **An'gus,** a county on the E. coast of Scotland, bounded N. by Kincardine and Aberdeen, E. by the North Sea, S. by the Firth of Tay, and W. by Perthshire. It is entered in the N. by many spurs of the Grampians, known as the Braes of Angus, alternating with many romantic glens, as the Esk, Clova, Prosen, and Isla. The flat fertile belt of Strathmore bisects F. from S.W. to N.E., while to the S. the Sidlaw Hills run at a distance of 8 miles from, and in a direction parallel to, the Firth of Tay. The chief rivers are the Isla, an affluent of the Tay, and the N. and S. Esks. F. has a coast 45 miles long, part of which, from Arbroath to the promontory of Redhead, is a line of sandstone cliffs worn into many deep caverns. Buddon Ness juts out at the entrance of the Tay Firth, and 13 miles to sea rises the Bell Rock Lighthouse. The soil of F. is partly fine alluvium, partly peat; and the chief formation is Old Red Sandstone. Of the 562,162 acres, comprising the area of F., 89,908 are under corn crops (oats 51,534); 48,795 under green crops (potatoes 12,386); 82,214 under clover, sainfoin, and grasses in rotation; and 31,391 under permanent pasture or grass not broken up. Small fruit is cultivated over 179 acres, and bare fallow or uncropped arable land represents 91. Mountain and heath land, used for grazing, amount to 186,995 acres, and 84 are laid out as nursery grounds. Woods and plantations cover 34,733 acres. See also CATTLE, HORSE, PIG, and SHEEP. The chief manufactures are coarse linen and jute, the former chiefly at Arbroath, the latter at Dundee; there are also at the latter place iron and engine works, and iron shipbuilding. Quarries of limestone, whitestone, and sandstone are worked in the county, and cod, herring, and ling fisheries are very productive. Among the towns are F. (the capital), Brechin, Montrose, Arbroath, and Kirriemuir. The county sends one member to Parliament. Angus, which was a possession of old Celtic Maarmors, was known as an earldom in the 12th c., and became subsequently a seat of the Umphravilles, the Stewarts, and Douglases. The antiquities are numerous, including several Roman camps, a vitrified fort at Finhaven, many sculptured stone pillars, the round tower and cathedral at Brechin, the ruins of Arbroath Abbey, Restennet Priory, the 'Bonnie House of Airlie,' and Edzell, a noble ruin overlooking the North Sea. The old baronial castle of Glammis is one of the finest in Scotland. Cortachy Castle, belonging to the Earl of Airlie, is imposing, but does not occupy a commanding site. Pop. civ. co. 277,788; parl. co. 67,515.

For'feiture and Corrup'tion of Blood was formerly a penalty consequent on Attainder (q.v.) for treason or felony.

Forfeiture of Lands was in feudal law the penalty incurred by a tenant for an act of disloyalty to his over-lord.

Forfic'ula. See EARWIG.

Forge (Fr. *forge*, Prov. *faurga*, from Lat. *fabrica*, 'a workshop'), a place in which wrought-iron in the shape of bar or scrap is fashioned into the forms required in construction. Where only light work has to be done the F. is generally called a *smithy*. In such a F. the furnaces for heating the iron are open hearths, air being supplied to each fire through a blast-pipe entering at the bottom of it. In the smithies of engineers a fan or Blowing Machine (q.v.) is employed to produce the blast, each hearth having a valve by which to regulate the quantity of air passing through it. Each hearth is attended to by at least two men, a smith and a striker, whose names sufficiently show their respective shares in the work. All the smaller forgings, which are hammered by hand, are made by these men. All smithies, except the smallest, are furnished with one or more Steam-Hammers (q.v.) to be used for larger work. In the F. proper, heavy forgings, such as crank shafts, armour plates (when not rolled), rudder posts, wrought-iron guns, &c., are made. Here large air-furnaces take the place of the open hearths, and all hammering is done by large steam-hammers instead of by hand. The 'portable F.' is a small iron hearth supported upon a movable framework (generally upon wheels), and fitted with a pair of bellows, or a small blowing machine worked by hand.

For'gery ('the art of fabricating') is the fraudulently making or uttering of a document to the injury of another, or the making or falsifying of a stamp to the loss of the revenue. To constitute F. it is not necessary that the whole instrument should be fictitious. Making a fraudulent insertion, alteration, or erasure in any material part of a true document, by which another may be defrauded, the fraudulent application of a false signature to a true instrument, or of a real signature to a false instrument, the alteration of the date of a bill after acceptance with fraudulent intention, are forgeries. A note being payable at a banker's who fails, to fix a piece of paper over the name of that banker, writing over it the name of another banker, is F. So is it also to put a fictitious signature to a bill of exchange. The essence of F. is an intent to defraud; therefore where the imitation of a signature or alteration of a writing can injure no one, the offence is not committed; but if the act can injure any one, there will be a presumption of fraudulent intention. If the counterfeited document be such as would be ineffectual if real, the crime may still be committed. Uttering (q.v.) is essential, and merely to show the forged instrument is not uttering. To have, without lawful excuse, the proof of which lies on the accused, forged bank-notes, or any appliances for making them, is punishable with penal servitude. (See BANK-NOTE.) Knowingly to make a false entry in any public register is F. Further provisions have been made against the crime by the Statute 24 & 25 Vict. c. 98, which imposes severe penalties on the F. of stock certificates issued under the National Debts Act, and on the personation of owners of stock, and on engraving plates for stock certificates. The extreme penalty for F. is now penal servitude for life. Five years are the minimum punishment of penal servitude, and two years the maximum of imprisonment. Companies and local boards have been relieved from the liability of compensating an innocent loser by reason of a forged transfer or transfer under a forged power of attorney (Statute 54 & 55 Vict. c. 43).

Forget'-me-not, a well-known species of plants belonging to the *Boraginaceæ* or borage order. It is sometimes known also by the name of 'scorpion grass,' from its peculiar inflorescence. F. is a herb of annual or biennial nature. The calyx is five-cleft, and the corolla is *rotate* or *salver-shaped*. The flowers are blue, the leaves being alternate, and the stem of rounded form. An allied species is *Myosotis sylvatica*, which has its calyx covered with stiff expanded hairs. *M. Azorica* occurs at the Azores, and *M. versicolor* is a common garden weed, the flowers of which are first coloured yellow, and then develop a blue colour. *M. Alpestris* is a mountain-growing species.

Forisfamilia'tion is a term of Scotch law denoting the separation of a child from the family of its father. Where a child has a separate estate from the father, the profits of which become its own, it is held to be forisfamiliated even though it remains in its father's family. F. takes place when a child is married or lives in a separate family with the consent of its father. The term is also used to signify either an onerous or gratuitous renunciation of *legitim* by a child. See LEGITIM, AGE.

Fork (Old Eng. *forc*; comp. Lat. *furca*), an instrument with two or more metal prongs, used, when small, at table for eating with, and, when large, in several farming and gardening operations. The nations of antiquity generally put their fingers to the use to which a table-F. is now applied; but a two-pronged bronze F. was found at Nineveh by George Smith in 1874. Previous to this discovery, nothing had been known of the existence of forks in times so remote. They are first heard of as an article of luxury brought by a Greek princess from Constantinople to Venice at the end of the 11th c. The name is occasionally met with in inventories of the 12th and later centuries, but the paucity of the references only goes to prove the extreme rarity of forks before the 15th c. In the following century they were in general use in Italy; the gastronomic art had then reached the greatest degree of magnificence and refinement in Venice, Florence, and Rome. A table instrument formed of a spoon and a two-pronged F. joined together was known in England long anterior to that time, even in the pre-Norman epoch, but its use was for serving, not feeding. Coryate, the English traveller, visited Italy in 1608, and in his *Crudities* (1611) gives an interesting though quaint account of the use of the 'little F.' in that country. On his return to England he continued its use at meals, and was ridiculed for doing so. Slowly, thereafter, the F. became general at table, not however without opposition on the part of the clergy, who denounced the innovation as 'wicked,' and 'an abominable violation of primitive manners.' The washing of the hands before and after meals, which was rendered necessary by the primitive mode of eating, then fell into disuse. In Ben Jonson's comedy *The Devil is an Ass* an allusion is made to that circumstance—

> 'The laudable use of forks,
> Brought into custom here, as they are in Italy,
> To the sparing of napkins.'

The earliest forks were made of silver, and the introduction of others with steel prongs assisted in spreading the custom of using them among all classes. Asiatics do not use the F.; in China *chopsticks,* two slender rods of wood or ivory, take its place. An instance of the use of the F. among savages is reported of the Fijians, who fifty years ago were the most inveterate cannibals known; when eating human flesh, a large F., made of the hard wood of the *Casuarina*, was used, whereas at ordinary repasts the mode more befitting savages was followed.

For'li (the Roman *Forum Livii*), a walled town and capital of a province of the same name, N. Italy, between the rivers Ronco and Montone, at the base of the Apennines, 40 miles S.E. of Bologna by railway. Pop. 41,720. It is the seat of a bishop, and has many splendid buildings, chief among which are the Palazzo Guerini, designed by Michael Angelo, and the cathedral, containing pictures by Carlo Maratti, Guido, &c. There are some silk and salt industries, and a trade in hemp, corn, woad, and carthamus. The sulphur mines of F. produce about 24,900 tons of sulphur annually. F. was founded by Marcus Livius Salinator in 207 B.C. In the Middle Ages it formed a republic, and suffered greatly in the time of the Guelph and Ghibelline factions.

Forlorn' Hope, in warfare, is the name given to a body of picked troops or volunteers devoted to some desperate enterprise. The corresponding name in German is *Die verlornen posten*, in French *Les enfants perdus*.

For'mâ Pau'peris, In, in the law of England and of Scotland, is the term denoting the mode in which an action may be maintained by one who is too poor to follow the usual way. In England it is provided by statute that any one having just cause of suit, who can take oath that, beyond the subject matter of the cause and his clothes, his possessions are not worth £25, shall be entitled to sue without paying any fee to counsel, attorney, or clerks in court; provided the case for himself has been submitted to counsel for opinion, and provided this opinion and an affidavit of his own or of his solicitor be produced in court, when the court will decide whether he, the pauper, be admitted to sue or not. If the pauper be allowed to sue, then the court may assign him counsel, or solicitor, or both, to act for him gratuitously. In this way the poor man, in this country, is assisted to bring his action when he has good grounds for doing so.

Forma'tion, in geology, is a somewhat vague term applied to a group or series of conformable strata, differing in lithological character and even in their fossil contents.

Formi'ca. See Ant.

For'mic A'cid derives its name from the fact that it is secreted by the ant (*formica*). When the insect is irritated it ejects the acid, which is at once recognised by its peculiar odour and by the stinging sensation it produces if it comes in contact with the skin. It also occurs in the free state in the nettle (*Urtica urens*), and is the cause of the disagreeable effect produced when the plant is touched. It may easily be obtained in a dilute state by distilling oxalic acid with its own weight of glycerine. The glycerine takes no apparent part in the decomposition of the oxalic acid, but simply exercises a catalytic action (see Catalysis) whereby the oxalic acid is split into formic and carbonic acids. In order to prepare it pure and anhydrous, dry sulphuretted hydrogen is passed over gently warmed formate of lead. Pure F. A. is a pungent liquid, having a peculiar odour, and exercising a very corrosive action on the skin. It boils at 99° C., and crystallizes when cooled to — 6° C. Its only compound of any practical importance is formic ether or artificial essence of rum, which is prepared by distilling a mixture of starch, alcohol, binoxide of manganese, and sulphuric acid.

Form'ings Island, in the Pacific, to the N. of the Sandwich Islands, has a good harbour, on which account it was occupied by the English in 1860.

Formo'sa (Span.; Lat. *formosa*, 'beautiful'; Chinese, *Tai-wan*, 'terrace'; Malay, *Pekan* and *Pakkando*), an island in the Chinese Sea, 90 miles off the province of Fukien, from which it is separated by the F. or Fukien Channel. It is 237 miles long, with an average breadth of 70 miles, and is of great natural beauty. A central range, rising to about 12,000 feet, divides F. into a fertile western plain, and an eastern Alpine region. The mountains are of volcanic origin, fantastic in outline, and cleft by deep gorges running up from the sea, clothed with bright verdure and watered by many cascades. The western plain is cultivated like a garden by Chinese, who have settled there in some numbers; while the eastern high lands are held by wild tribes named Peppohoans, of Mongolian origin. The area is estimated at 15,000 sq. miles, and the pop. at 3,500,000. Rich coal-mines have been opened in the N. of F. by the Chinese, who have also spread over the E. coast. The mining is carried on very primitively, but much coal is exported to China, especially to Foo-chow. The interior has veins of sulphur and various metals. Besides coal, the chief exports are rice, for which F. is famous, tea, brimstone, timber, &c. The principal places are Tai-wan, the capital, opened to foreigners in 1858, and Ke-lung, a rising port in the N., and the centre of the coal trade. An atrocious massacre of some Japanese sailors who were wrecked on the E. coast of F. in December, 1871, compelled the Japanese Government, who could obtain no redress from the Chinese authorities, to invade the island. General Saigo landed in May, 1874, with a force of 3000 men, and inflicted severe punishment on the guilty tribes. The Chinese were greatly excited, and for some time war seemed imminent between the two empires, but peace was finally maintained, and on the 2nd or 3rd of December the Japanese troops withdrew. One of the conditions of peace, insisted on by the Japanese in 1895, was the handing over of F. to the victors. Directly the Chinese agreed to this, the inhabitants of F. declared themselves to be a republic, and obstinately opposed the landing of the Japanese forces, which, however, before the end of the year, succeeded in capturing all the principal places, and in driving off their opponents either across the seas or into the wildest parts of the island.

Formosus, a bishop of Porto and missionary among the Bulgarians, who incurred the displeasure of Pope John VIII., and was charged with being implicated in the latter's death. The new pope, Marinus, however, raised the anathemas and loaded him with honours. F. crowned Pope Stephen V. and was chosen as his successor. The election led to much protest and disorder, caused by the partisans of Sergius and two other candidates for the papacy. F., having sided with the German Arnulf, was placed over Rome, that had revolted from F., when the city was captured by the German host. Arnulf then proceeded on his conquest of Italy, but was suddenly struck down by paralysis. Had not F. died at that time (896), he would very probably have fared badly at the hands of the Italians, who at once rose against the forces of the dead champion.

Pope Stephen VI. had the body of F. disinterred and tried before an ecclesiastical court; and there being no defence, the corpse was found guilty and was cast into the river, whence it was taken out by some fishermen, and at once commenced to work miracles. This produced a revulsion of popular feeling; the remains of F. were buried with every token of honour and respect, and the judgment of the court, already mentioned, was annulled by Pope John IX.

Forms of Address are as various as the rank of those addressed, and a knowledge of the following may prove useful.

THE ROYAL FAMILY.

The Queen—Superscription, 'To the Queen's Most Excellent Majesty.' Commencement, 'Madam;' conclusion, 'I remain, Madam, Your Majesty's most faithful subject and dutiful servant.'

The Prince of Wales—Sup., 'To His Royal Highness the Prince of Wales.' Com., 'Sir;' conclusion, 'I remain, Sir, Your Royal Highness's most dutiful, and most obedient servant.'

Princes of the Blood Royal—Sup., 'To His Royal Highness the Prince ——.' Com., 'Sir;' conclusion, 'I remain, Sir, Your Royal Highness's most dutiful, and most obedient servant.'

The Princess Royal—Sup., 'To Her Royal Highness the Princess Royal.' Com., 'Madam;' conclusion, 'I have the honour to be, Madam, Your Royal Highness's most obedient and humble servant.'

Princesses of the Blood Royal—Sup., 'To Her Royal Highness the Princess ——.' Com., 'Madam;' conclusion, 'I have the honour to be, Madam, Your Royal Highness's most obedient and humble servant;' refer, 'Your Royal Highness.'

Princes of the Blood, embracing the sovereign's nephews and cousins—Sup., 'To His Highness the Prince of ——.' Com., 'Sir;' conclusion, 'I have the honour to be, Sir, Your Highness's most obedient and humble servant.'

Princesses of the Blood, embracing the sovereign's nieces and cousins—Sup., 'To Her Highness the Princess —— of ——.' Com., 'Madam;' conclusion, as above, substituting *Madam* for *Sir*.

NOBILITY AND GENTRY.

Dukes—Superscription, 'To His Grace the Duke of ——.' Commencement, 'My Lord Duke.'

Duchesses—Sup., 'To Her Grace the Duchess of ——.' Com., 'Madam.'

Marquesses—Sup., 'To the Most Honourable the Marquess of ——.' Com., 'My Lord Marquess.'

Marchionesses—Sup., 'To the Most Honourable the Marchioness of ——.' Com., 'Madam.'

Earls, Viscounts, Barons—Sup., 'To the Right Honourable the Earl of ——.' 'To the Right Honourable the Lord Viscount ——.' 'To the Right Honourable the Lord ——.' Com., 'My Lord.'

Countesses, Viscountesses, and Baronesses—Sup., 'To the Right Honourable the Countess of ——.' 'To the Right Honourable the Viscountess of ——.' 'To the Right Honourable the Lady ——.' Com., 'Madam.'

Baronets—Sup., 'To Sir William ——, Bart.' Com., 'Sir.'

Knights—Sup., 'To Sir John ——.' Com. as above.

The Wives of Baronets and Knights—Sup., 'To Lady ——.' Com., 'Madam.'

Sons of Peers—The younger sons of Dukes and Marquesses are also styled Lords, and addressed as such with the addition of their Christian names, as, 'Lord John ——.' The younger sons of Earls, and all the sons of Viscounts and Barons, are styled Honourable, as, 'To the Honourable William ——.' Com., 'Sir.'

Wives of the Sons of Peers—Sup., 'To Lady William ——.' 'To the Honourable Mrs. ——.'

Daughters of Peers—Sup., 'To Lady ——.' 'To the Honourable Miss ——.' Com., 'Madam.'

Privy Councillors—Sup., 'To the Right Honourable Thomas W——.' Com., 'Sir.'

Army and Navy—Admirals when addressed officially have the rank of their flag added to their name and title, as, 'To the Right Honourable the Earl of ——, Admiral of the Fleet.' Commodores and captains take their rank and title *after* their designation on the *Naval List*. In the army all officers take their name and title *after* their rank in the *Army List*.

Governors of Colonies, &c.—Sup., 'To His Excellency Sir ——,' or, 'To His Excellency General ——, Governor of ——,' or, 'Governor and Commander-in-Chief.' Com., 'Sir.'

Archbishops—Sup., 'To His Grace the Archbishop of Canterbury.' Com., 'My Lord Archbishop.'

Bishops—Sup., 'To the Right Reverend The Lord Bishop of ——.' Com., 'My Lord.'

Deans—Sup., 'To the Very Reverend the Dean of ——.' Com., 'Very Reverend Sir.'

Archdeacons—Sup., 'To the Venerable the Archdeacon ——.' Com., 'Venerable Sir.'

Lord Advocate (of Scotland)—Sup., 'Her Majesty's Advocate for Scotland,' but by courtesy, 'The Right Honourable the Lord Advocate.' Com., 'Sir,' but by courtesy, 'My Lord.'

Lord-Lieutenant of Ireland—Sup., 'His Excellency the Lord-Lieutenant.' 'His Grace the L.-L.' (if a Duke).

Lord Mayors are six in number, those of London, York, Liverpool, Manchester, Belfast, and Dublin—Sup., 'To the Right Honourable the Lord Mayor of ——.' Com., 'My Lord.'

Lady Mayoresses are addressed in the same style as their husbands.

Lord Provost of Edinburgh—Sup., 'The Right Honourable the Lord Provost.'

Forms of Proced'ure. See PROCESS.

Forr'es, an old royal burgh of Scotland, in Elginshire, on the Findhorn, 2 miles from the sea, and 10 miles W.S.W. of Elgin by railway. It stands on an old sea-terrace at the base of the Cleeny Hills, four gravelly elevations, on the highest of which—on the site of ancient fortifications—is the Nelson Tower (66 feet), erected in 1806. F. was formerly the seat of the Archdeacon of Moray, and there still remains a portion of the 'mantle wall' which once surrounded the college or cathedral kirk, and which contains the Paris Port, or bishop's entrance. To the W. are the ruins of a castle; to the E. a rudely-hewn pillar, 25 feet high, called Sueno's Stone, or the 'Stan'in' Stane,' a sandstone pillar, 20 feet high, and carved with representations of men and animals said to have been erected in 1014 to commemorate the expulsion of the Danes by Malcolm II. The chief industries are distilling, brewing, and dyeing. F., along with Inverness, Nairn, and Fortrose, forms the Inverness District, and returns one member to Parliament. Pop. parl. and royal burgh 3691; civ. par. 4801; royal burgh and civ. town (each) 3971.

Forr'est, Edwin, a celebrated American actor, born in Philadelphia, 9th March, 1806, first appeared on the public stage at the age of fourteen as Douglas (27th November, 1820). After playing in the chief western cities during a long professional tour, he appeared at the Park Theatre, New York, as Othello, in 1826, and at once achieved reputation. He visited England in 1835, again in 1837, when he married Catherine Sinclair, and a third time in 1845. On the third visit to England the friendly relations that had previously subsisted between F. and Macready, were severed; and on the occasion of the professional tour of the latter in America, F.'s partisans were the cause of a riot, 10th May, 1849, from which the English tragedian barely escaped with his life. F. continued to play till 1871, after which he gave a few Shakespearian readings. He died at Philadelphia, 12th December, 1872. F. added a fine presence to a distinct and even powerful histrionic genius. He is said to have left a fortune of over one million dollars, the greater part of which he devised for founding an institution for aged and destitute actors. His splendid library was destroyed by fire at his house in Philadelphia in 1873. See W. R. Alger's *Life of E. F., the American Tragedian*.

For'ster, Johann Reinhold, a celebrated naturalist and traveller, was born at Dirschau near Danzig, 22nd October, 1729. Educated for the Church, F. for some time after 1753 officiated as a pastor at Nassenhuben, but being devoted to philosophy, science, and mathematics, was employed by the Russian Government to investigate the condition of a colony at Saratov. He afterwards removed to England, and taught natural history and the French and German languages at Warrington, Lancashire. In 1772 he accompanied Captain Cook in his second voyage round the world as naturalist. On his return, in 1775, the University of Oxford conferred on him the degree of LL.D., and three years later he published the results of his botanical observations, and *Observations made during a Voyage round the World*. Some disputes arising between F. and his English friends, he took the position of Professor of Natural History, &c., at Halle, in Saxony, and produced a number of works. F. was a good scholar in classics and literature, and is said to have been able to speak and write seventeen different languages. He died at Halle, 9th December, 1798.—**Johann Georg Adam F.**, son of the preceding, was born at Nassenhuben, 26th November, 1754. He was with his father in Russia and England, accompanied him in his voyage along with Captain Cook, and became Professor of Natural History first in Hesse Cassel (1778), and then in Wilna (1784). He settled in Mainz as a bookseller, and as librarian to the Elector. In 1790 he accompanied Alexander von Humboldt to Britain, France, and the Netherlands; finally he embraced republican opinions, and in 1793 was sent to Paris to solicit the incorporation of Mainz with the French Republic. When Mainz was taken by the Prussians, F. appears to have lost his books, MSS., &c., and was on the point of leaving for India and Turkestan when he died in Paris, 12th January, 1794. He wrote on ethnology, philosophy, politics, geography, and natural history. A collection of his letters was published by his widow, a daughter of Heyne (Leipz. 1828-29), and his complete works were edited by his daughter (Leipz. 1843-44).

For'ster, John, an eminent journalist and biographer, was born at Newcastle in 1812. Educated for the bar, he devoted himself to literature and journalism. He succeeded Charles Dickens as editor of the *Daily News*, but retired from the post in a year. A connection which F. formed with the *Examiner*, during the brilliant editorship of Albany Fonblanque, lasted for eighteen years, F. in the course of it becoming editor in 1846, and retiring from the office in 1856, on his having been appointed the year previous Secretary to the Lunacy Commission. Five years later he became Commissioner in Lunacy. He died 1st February, 1876. F. will be chiefly memorable for his historical and biographical works. He devoted himself largely to the period immediately prior to the advent of Cromwell, and in discharge of his duty of 'righting wronged reputations,' as Fonblanque styled it, wrote *Statesmen of the Commonwealth of England* (1831-34), *Arrest of the Five Members*, and the *Grand Remonstrance* (1860), and *Sir John Eliot, a Biography* (1864). F. was the intimate friend of a number of the most eminent literary men of the day, such as Landor, Dickens, and Carlyle. He published a biography of Landor in 1868, and of Dickens in 1871-74. He also wrote a *Life of Oliver Goldsmith* (1848), and shortly before his death published the first volume of a *Life of Swift*.

Forster, Rt. Hon. William Edward, was born at Bradpole in Dorset, 11th July, 1819, was educated at the Friends' School, Tottenham, and became engaged in the worsted trade at Bradford. He married Jane, the eldest daughter of Dr. Arnold of Rugby. He was elected for Bradford in 1861, and during the following 25 years retained the seat in the House of Commons. In 1865-66 he was Under Secretary of State for the Colonies, and in 1868 became Vice-president of the Council of Education, and was sworn in a member of the Privy Council. In 1870, as a member of the Cabinet he brought forward and passed the Education Act, which altogether changed the elementary education system of the country. In 1872 he also passed the Ballot Bill. In 1875 he was elected Lord Rector of Aberdeen University. In 1880 he again became a Cabinet supporter of Mr. Gladstone, and this time as Chief Secretary for Ireland, which post he held for two years, and during that time he was vilified by the Nationalist party, threatened by the 'Invincibles,' and in the end deprived of the support of his colleagues. Thereupon F. resigned office, but continued to take an active part in parliamentary affairs. He showed himself to be an opponent of Mr. Gladstone's policy both in Irish affairs, in S. Africa, and in the Sudan. He was nominated at the general election for his old constituency of Bradford, and elected, though he was too ill to be present. On 5th April, 1886, F. died, and in him the country lost a bold, honest, earnest, unselfish patriot, whose influence in the House of Commons arose more from straightforward and vigorous dealing and speaking than from oratory and tact.

Fort, Fort'ress (Lat. *fortis*, 'strong'), a place of strength, within the defences of which a small body of men may repulse a considerable force. The name *fort* is commonly applied to a star-shaped or bastioned work of military engineering; the term *fortress* is of wider application, and may be used to designate a group or series of fortified works. See FORTIFICATION.

Fort, in British North America, is the name applied to the different posts or trading stations of the Hudson Bay Company (q.v.) or other fur-trading corporations. These posts, usually log-built structures with sleeping, dining, and store rooms, are not in any sense strongholds.

Fort Augus'tus (Gael. *Cilla-Chuimein*, 'the cell or church of Cumin,' probably the 'Cumineus albus' who was abbot of Iona 657-669), a small fort at the S. end of Loch Ness, 29 miles from Inverness, and in the very centre of the great glen of Scotland, built in 1716 with the view of bridling the N. Highlanders. It received its present name in 1730 in honour of the Duke of Cumberland. F. A. is a quadrangle with bastions, and was well fitted for about a hundred soldiers. It was in 1857 sold by Government to Lord Lovat, whose son handed it over to the Benedictine order. Since 1882 it has been used as a college, abbey, &c., of the Benedictines.—F. A. is also the name of a village in the immediate vicinity of the fort, having a pop. of 611.

For'te (Ital. 'strong or loud'), used in music as a mark of expression, and signifies 'loud.' *Fortissimo* means 'very loud.'

For'tescue, a noble English family said to have sprung from a certain Richard *le Fort* who accompanied William of Normandy to England, and at the battle of Hastings covered him with his shield, on account of which he received the name *Fort-escue* ('strong shield'). This pretty legend is embodied in the motto of the F. arms, *Forte scutum, salus ducum*. The most distinguished member of the family was **Sir John F.**, son of one of the bravest generals of Henry V. He was born about 1395, studied at Oxford, and in 1442 was Chief-Justice of the King's Bench. On the outbreak of the Wars of the Roses, he sided with the Lancastrians, and in 1461 fled with Queen Margaret to the Continent, where he wrote (1463) for the young Prince Edward his famous treatise in dialogue, *De Laudibus Legum Angliæ*. In 1471 F. returned to England, submitted to the House of York, and died in 1485 at his estate of Ebrington in Gloucestershire. Another valuable work of F.'s is *The Difference between Absolute and Limited Monarchy* (Lond. 1714). In both of these F. proves himself a sound English Constitutionalist. **Sir Hugh F.**, a lineal descendant of Sir John, became Baron F. in 1746, but the first earl in the family was **Hugh F.** (born 1753, died 1841). **Hugh, second Earl F.** (born 1783, died 1861), took an active part in the great debates on the first Reform Bill, and was Lord-Lieutenant of Ireland till the fall of the Whig Government in 1841. **Hugh, third Earl F.**, born 4th April, 1818, was educated at Harrow, entered Parliament in 1841, as Viscount Ebrington was called to the Upper House in his father's Barony of Castle Hill, Devon, in 1859, and in 1861 succeeded his father, the second Earl F. He has throughout his public career been an indefatigable sanitary reformer. He has written several pamphlets on social, political, and educational questions.

Fort George (Gael. *Aird-nan-saor*, 'height of the carpenters'), a fort in the county of Inverness, on a sand-spit in the Moray Firth, 12 miles N.E. of Inverness. It has barrack accommodation for over 2000 men, and unlike the two smaller forts at one time connected with it, Fort Augustus and Fort William, is still kept in use. It mounts seventy guns, and is very scientifically defended, but would be of little avail against the artillery of the present day. It was built shortly after the Jacobite rising of the '45, at a cost of £160,000, and embraces an area of 12 acres. The depot of the Seaforth Highlanders (the Duke of Albany's Ross-shire Buffs) is located here—Regimental District No. 72.

Forth, one of the most picturesque rivers of Scotland, rises in the N.W. of Stirlingshire, and has a direction mainly E. by S., forming part of the boundary between the shires of Perth and Stirling, and expanding into the Firth of F. near Alloa, after a very sinuous course of 70 miles. Its upper waters are the Duchray, 16 miles long, from the E. base of Ben Lomond, and the Avendhu, 12 miles, from the W. side of Ben Venue. The latter flows through Lochs Chon, Dhu, and Ard, and the united stream leaves the romantic region of the Highlands at Aberfoyle. From the N. the F. receives the Teith, Allan, and Devon; the principal town it passes is Stirling, to which it is navigable for vessels of 100 tons. Below Alloa the estuary gradually widens, occasionally contracting, as at Queensferry (three-quarters of a mile), till it reaches its greatest breadth of 25 miles between Musselburgh and Largo Bay. The *Firth of F.* separates the counties of Stirling, Linlithgow, Edinburgh, and Haddington on the S. from Clackmannan, Perth, and Fife on the N.; and the chief towns on its shores are Leith, Portobello, North Berwick, Queensferry, Grangemouth, Culross, Burntisland, and Kirkcaldy. At its entrance from the sea stand the Bass Rock and Isle of May. It contains the islands of Inchcolm, Inchkeith, Cramond, and others. It receives from the S. the Carron, Avon, Almond, and Esk, from the N. the Leven, and its waters have a maximum depth of 30 fathoms. St. Margaret's Hope, above Queensferry, is one of the safest of British roadsteads.

Fortifica'tion, the art or science of strengthening a military position by means of defensive works, is resorted to equally by forces in attack and on defence. In warfare, the ultimate purpose of defensive works is to oblige the enemy to fight under the most disadvantageous circumstances, mainly by making use of natural or artificial cover as a protection against his fire, and as a shield from under which counter-fire may be delivered. Natural F. is the utilisation of natural objects—rivers, marshes, forests, ravines, &c.—to delay the assault of an enemy, and to render it more or less ineffectual when made. Artificial F. is constructive, and has been described as military architecture, or the art of strengthening natural obstacles to an enemy's advance, or, where such natural obstacles do not exist, of constructing works to serve the same purpose, by the skill of the engineer. The latter division of the subject falls to be considered under the two headings *Permanent* and *Field or Temporary F.* The purposes of both permanent and field works are identical, and in their construction the same principles are brought to bear. The principal features of both are a ditch to impede the enemy's assault, and a parapet on the side of the ditch occupied by the defence to afford the defenders protection against the enemy's fire, and at the same time enable them to deliver their own fire without exposing themselves to the enemy's marksmen. Field-works, thrown up for a temporary purpose, by unskilled labour, and with such materials as the locality affords, are often rude and slight; permanent fortifications, however, intended for the permanent protection of countries, capitals, arsenals, dockyards, &c., are deliberately built by the most skilful engineers, and with the best materials the age and the country can command, and are, so far, perfect as works of military engineering.

Permanent Fortification.—In the history of military science, the art of defence has gradually developed so as to meet the exigencies of a gradually-developing art of attack. In early days enclosing walls—the original *enceinte*—were considered sufficient to protect a city against a besieging force. Later the walls were strengthened by projecting towers at bowshot distance from each other, and from the loopholes of which an effective flank fire could be delivered along the face of the wall. After the invention of gunpowder and the introduction of artillery, the defensive wall and tower were lowered, so that guns mounted upon them might be fired at a level low enough to sweep the ground occupied by the enemy, and thus the tower became practically a *bastion*, and one of the chief features of modern F. was created. The bastioned system of F., due originally to the ingenuity of the Italian engineers of the early part of the 16th c., was developed by the genius of Vauban (q.v.), Cormontaigne, and other engineers, and all the French and many of the Continental fortresses of our own day are built on this system. The favourite type of permanent F. at present, however, the adoption of which has doubtless been due to the changed conditions of war consequent upon recent improvements in artillery, was advocated a century before Vauban's day by no less a person than Albrecht Durer, who in his work on F. in 1527 recommends what has always been known as the 'polygonal system.' This system was first adopted in Germany early in the present century, was subsequently employed (with modifications) by Belgium, and more recently by Great Britain in the construction of the defences of the great English dockyards. Of the polygonal system the chief characteristics are that the lines of parapet are traced with reference to the space they have to enclose and the direction from which it is probable an attack would be made, and not with reference to the reciprocal *flank defence of the ditches.* Still, in the polygonal system, the defence of the ditch is provided for, in the event of its being reached, by placing casemated buildings (masked batteries in fact) within the ditches, and in such positions as to sweep them to right and left, or otherwise, by reverse galleries in the counterscarps. The profile and arrangements of the works of the bastioned and polygonal systems of F. are similar though not identical. The accompanying figure will readily familiarise readers with the names, relative positions, &c., of the principal parts of the Enceinte (q.v.) of all regularly-fortified works. The *rampart* (*a*) is a mound of earth raised above the natural level of the country, and formed of the soil obtained by excavating the ditch, which extends in front of it all round the work. The *terreplein* (*b*) is the platform on which the guns are placed and worked. The *banquette* (*c*) is a tread or step of earth upon which the infantry stand to deliver their fire. The *parapet* (*d*), the highest part of the rampart, is a *breastwork* 30 feet thick and about 8 feet higher than the terreplein, the purpose of which is to protect the troops working the guns and the infantry on the banquette from the musketry and cannon of the enemy. The parapet is pierced with embrasures, usually about 18 feet apart, through which the guns are fired. The *crest* of the parapet (*c*) is usually about 22 feet above the natural level of the country. The *superior* or *upper slope* of the parapet is about 18 feet broad, and has a slope of 1 in 6. The *exterior* or *lower slope* (*e*), the remaining part of the parapet, has a slope of nearly 1 in 3. At the foot of the exterior slope in bastioned works is the *berm* (*f*), a narrow level space or path which affords a means of communication round the outside of the works. The same purpose is served in polygonal F. by the *chemin des rondes*. The *escarp* (*g*) is the inside wall of the ditch, lined with mason-work to

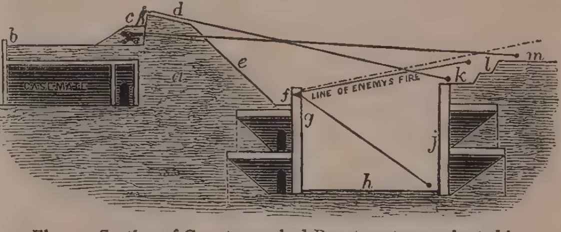


Fig. 1.—Section of Counter-arched Revetments, as adopted in England.

retain the earth of the rampart in its place. (The strong structure of mason-work is called the *revetment.*) The *main ditch* (*h*) is usually about 12 feet deep, and is often from 100 to 180 feet wide, though usually its width is from 13 to 18 feet wide. The *counterscarp* (*j*) is the wall round the outside of the ditch. The *covered way* (*k*) is a space of about 30 feet extending round the counterscarp, enclosed or covered from fire by a parapet. The *glacis* (*m*), with a banquette (*l*), is the sloping space beyond the covered way. The slope of the glacis brings the troops of the enemy within direct fire of the cannon and musketry from the parapet. The enceinte, consisting of the ditch and rampart, with its subdivisions of parapet, banquette, and terreplein, runs completely round the fortress whatever be its shape, and presents the same profile of glacis, covered way, ditch, rampart, parapet, and terreplein on all sides of it. Where water can readily be procured the ditch is flooded, and its depth of 12 feet obliges the enemy to construct rafts to cross it, and thus delays the assault at the very moment when the defenders are delivering their most destructive fire. The defensive works of a fortress are not all on the interior side of the ditch. There are *outworks* placed outside the ditch but within the glacis. The chief outwork in either of the systems of F. above mentioned is the *ravelin,* a large *Redan* (q.v.), which is useful as affording an advanced position for artillery to flank the glacis and enfilade the enemy's trenches. It is defended by ditches, which in the bastioned system are flanked by the guns of the bastions, and in the polygonal system by low casemated batteries in flanks connected with the ravelins themselves. *Advanced works* are open works beyond the glacis, under the protection of the guns of the enceinte, and the use of which is to protect ground unprotected by the guns of the fortress. *Retrenchments* are works *within works,* so that when the outer lines are carried, the defence may still be maintained by the inner lines. In the bastioned system, retrenchments are of frequent occurrence, especially within the bastions of the enceinte and in the ravelins, portions of the faces of which are isolated by a small ditch and parapet called a *coupure. Casemates* are arched chambers, which are bombproof under all ordinary circumstances. Magazines are always casemated. In a gun casemate the embrasure is made in the end wall of the casemate. In the Spithead Forts, Portsmouth, these end walls of casemates are constructed of iron. *Caponieres,* in the polygonal system, are large casemated stone structures built within the ditch, the purpose of which is to defend the ditches of polygonal fortifications. In German enceintes, the caponieres are detached from the escarps, are built in two stories, and are situated in the middle of each long *face* or *side* of the angle. In England they are generally attached to the escarps, have only one floor, and are placed at the angles of the ditches, so as to command both faces of the work. Communication between the works and the caponieres is maintained by a tunnel, which, when it also communicates with the ditch and outworks, is called a *postern.* A novel feature in modern F. is the mortar casemate, a vaulted chamber, without a front wall, in which the mortar is secured against vertical fire, and from which its fire can be brought to bear on the enemy advancing over the glacis. Mortar casemates are placed behind the rampart of the enceinte. Unseen by the enemy, they are the means of a most destructive fire of large shells being thrown among his advancing troops. Having reached the covered way, there is nothing to obstruct an enemy's entrance into the works of a fortress except the escarp, for the counterscarp wall may readily be blown in by mining. Nor in these days does the escarp offer a very serious obstacle, for the accuracy of the curved fire of the present day, and the weight of the shells now used, enable the artillerist to strike and destroy the strongest escarp, unless the latter be well concealed below the crest of the glacis. To neutralise as far as possible the great improvements in the accuracy and range of large guns used in attack, the tendency in modern F. is to make the ditch narrower and deeper, so that the top of the escarp wall shall be 10 or 15 feet lower than the crest of the glacis. In the profile of the English forts (Fig. 1), in which a *chemin des rondes* (*f*), or path of communication, extends round the works, between the escarp and the exterior slope of the parapet, this plan has been adopted. It may here be stated, that in *counter-arched revetments* the pressure or lateral thrust of the earth of the rampart falls upon the arches, and not upon the actual wall of the revetment. The arches are arranged usually in two tiers, and the space they afford is sometimes converted into loopholed galleries for musketry-fire through the escarp. These galleries, known as escarp or counterscarp galleries, are utilised in English and German fortresses to flank the caponieres, and thus aid in defending the ditch. In the bastioned system, bastions are connected by a curtain, in front of which is an outwork called a *tenaille,* with a parapet for the musketry defence of the ditch. The tenaille also acts as a counter-guard, and to protect the postern and escarps of the curtain and flanks from being breached. The main differences between the bastioned and polygonal systems of F. having already been adverted to, it remains to describe Fig. 2, which exhibits the arrangement of works on a front of the German polygonal system, merely premising that the great fortified works of England are constructed on similar, if not identical, principles. The figure given represents a portion of the enceinte which surrounds the work (if it be circular), and the profile of which is the same on all sides of the polygon. Beginning from the *interior* of the F., A A is the 'body of the place,' or the space enclosed by the enceinte; B B are casemated flanks in the *escarp of the rampart,* the purpose of which is to defend the ditch of the caponiere; C is a casemated caponiere, provided with two tiers of five guns, and built in the middle of the main ditch, which it commands to right and left; D is a ravelin with a ditch in front defended by the casemated flanks E E; F F are casemates in the ravelin to defend the ditch in front of the counter-guards G G; H H is the covered way, and J J the glacis.

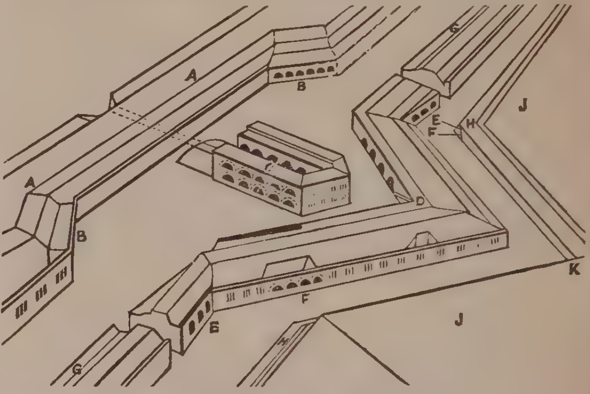

Fig. 2.—Arrangement of Works in a Front of the German Polygonal System.

The original works of Vauban were arranged, as to dimensions, &c., to be in harmony with the range, weight, &c., of the firearms of 1650, and are now obsolete. But apart from the matter of dimensions or relative proportion, the general arrangement of the fortified works of which he was the designer is still retained throughout France, and forms the basis of all the modern French systems, as exemplified in the fortifications of Paris, Metz, Lille, &c. One of the chief disadvantages of the Vauban or bastioned system, still prevalent in France, is the liability of the works to be swept by Enfilade (q.v.) or reverse fire. In the Franco-German war, Forts Issy and Vanvers in Paris, and a number of the bastions of the Paris enceinte, were thus swept by the enemy's cannon, and the great number of *traverses* or covering parapets which the French found it necessary to erect along the lines of, and at right angles to, their covered ways and terrepleins, so as to afford protection against enfilade fire, is sufficient evidence to prove that, to this extent, they were forced to acknowledge the defect of their system. Perhaps the most complete and most interesting permanent works of modern Europe are the magnificent fortifications of Antwerp constructed by General Brialmont. They consist of a most formidable and extensive enceinte, strengthened by a series of detached forts along the line at a distance from each other of about 2000 yards. A similar arrangement of defences—a continuous enceinte and a cordon of forts—may be seen at Paris, Metz, Lyon, Cologne, Coblentz, Mayence, &c., but Antwerp is *sui generis*, from the circumstance that in the construction and arrangement of its works the principles and details of the polygonal system have been applied and utilised with the greatest possible success.

Field Fortification.—The object of field as of permanent works is to enable a smaller to resist the attack of a larger body of men. When time is afforded for their careful construction, they are found to present a profile similar to that presented by permanent works, viz., a sheltering rampart, with parapet, ditch, and glacis. Field-works are of two kinds—open and closed. The simplest *open work* is a straight line, useful to close a gorge or defend an isthmus, but in ordinary ground liable to be destroyed by enfilade. The redan or *flèche* (Fr. 'arrow'), consisting of two straight lines or faces, forms what is called a *salient angle*. The line bisecting this angle is called a *capital*, and a line between the open ends of the two lines or faces is called the *gorge*, which, being undefended, exposes the work to the liability of being taken in rear. A Russian redan was captured at Borodino by French cavalry riding in at the rear of the work by the gorge. Another defect of this field-work is that no provision is made for the defence of its ditch. Redans are commonly constructed for the defence of a bridge, defile, or any narrow passage. When flanks are added to redans at an angle of 100°, the work is vastly strengthened, as the flanks command the ditch as well as the ground in front of the salients. A *lunette* is a redan with two flanks running parallel to the *capital* or bisecting line of the two faces or lines forming the redan. A double redan is a work in which two redans are joined together, and provision is thus made for the reciprocal defence of the inner ditches. *Enclosed field-works*, or such as are entirely surrounded by a parapet, are called *forts* when the ditches are flanked by the parapets; but where no flanking defence is afforded by the parapets, the work is called a *redoubt*. *Redoubts* may be of any shape, regular or irregular, provided the fire from any face of the rampart does not defend any line of ditch. Such works are readily constructed, and are defended by fewer men than forts. In redoubts, however, as in the polygonal system of F., the defence of the ditch is often provided for by placing caponieres so as to sweep it right and left, or by the construction of loopholed galleries in the counterscarp. Field-works comprise three kinds of forts—star, demi-bastioned, and bastioned forts. The bastioned fort is an elaborate work, constructed only in cases in which an important spot is to be fortified and an obstinate defence intended. Its ditch should be 12 feet deep, and its parapet 10 feet high and 16 feet thick, to resist a fairly heavy gun. *Blockhouses*, usually formed of logs of wood, loopholed, and arranged vertically in the shape of a rectangle, polygon, or cross, are proof against rifle bullets, but offer no defence against artillery, and are only valuable in mountainous or thickly-wooded country, impracticable for field-guns. When built in the form of a cross, the blockhouse permits of a flank defence. In the Turko-Russian war (1876), field-works of this description were eminently serviceable. *Fortified lines* are either continued or interrupted by intervals. *Continued lines* are a connected line of field-works, the purpose of which is to enclose a front or connect isolated forts by a continuous parapet. They are now seldom used, from the circumstance that a parapet broken by salient and re-entering angles requires more men for its defence than are required for an ordinary line of battle, and that when once broken by the enemy, the lines may be regarded as lost. *Redan lines*, designed by Vauban, consist of a series of redans, the salients of which are 240 yards apart, and the inner faces connected by curtains. *Indented* or *cremaillère lines* consist of a series of alternate long and short faces, forming salient and re-entering angles of 90°. The defects of this trace are that the fire from the short faces is ineffective until the enemy arrives at the counterscarp of the line, and that they are exposed to enfilade fire. *Bastioned lines* consist of a series of connected bastions. The salients of the bastions are 360 yards apart, the perpendiculars are not more than 45 yards. In this trace the faces are much exposed to enfilade. *Lines with intervals* have, for almost all purposes, superseded continued lines, (1) because, as there is less extent of parapet to defend, they do not drain the garrison to an equal extent; (2) because, when one part of the line is forced, the whole does not fall; and (3) because the defending force can readily advance to the attack between the intervals. *Têtes-de-pont* or *bridge-heads* are bastioned works thrown up to cover the advance or retreat of an army across a river.

Obstacles.—In field F. the parapet is practically the only actual defensive work, and is usually constructed in haste, and often—in cases in which an earthen rampart cannot be thrown up—of materials which afford only insufficient cover. During the American civil war a favourite form of parapet was constructed by cutting down trees and of these raising a rude breastwork. All such parapets, however, may be readily taken by assault, unless the approach to them (the glacis) is rendered difficult by what are termed obstacles. The purposes of obstacles are to impede the advance of the enemy at those points upon which the defenders can pour their most destructive fire. Obstacles may be of endless variety, dependent upon the ingenuity and resources of the commander; but 'good' obstacles must be placed well within the defenders' fire, must be sheltered from the artillery fire of the enemy, must afford no cover to the assailants, and must be so constructed as not to be easily removed or destroyed. The following are the obstacles most commonly used in field F.:—The *trou-de-loup* ('wolf-hole'), a pit of the form of an inverted cone, from 6 to 10 feet deep, 6 feet diameter at the surface, and 1 foot wide at the bottom, into which a pointed stake is driven—a contrivance which, peculiarly successful in disabling cavalry, was used with effect at Bannockburn, and is still held in esteem; *pickets* or pointed stakes, one or two inches broad, and three feet long, driven firmly into the ground close together, also effective against cavalry, and when planted on the brow of a parapet (above the escarp), cause much trouble to escaladers; *crow's feet*, which fall so that they may always present an upward-pointing iron spike,—another contrivance *pour encourager* the enemy's cavalry; *Abattis* (q.v.); *entanglements*, young trees or brushwood picketed down to the ground; *Chevaux-de-frise* (q.v.); and *fougasses*, small mines filled with stones or shells, charged with gunpowder, and fired either by a hose or by electricity.

Fortiguerr'a, Niccolo, an Italian churchman and poet, attached as Chamberlain to the household of Pope Clement XI., was born at Pistoia, 7th November, 1674, and died at Rome, 7th February, 1735. His fame rests chiefly on his light epic poem *Ricciardetto* (first published at Venice in 1738), abounding in comic incident and in satire on the morals of the clergy.

Fortrose', or **Fortross',** a royal burgh and seaport in Ross-shire, on the W. side of the Moray Firth, 10 miles N.N.E. of Inverness, and opposite Fort George, with which it has communication by ferry. It was formerly a centre of culture in the N., and had a cathedral and bishop's palace, the stones of which were taken by Cromwell to build a fortress at Inverness. There is still some trade in grain, pork, eggs, &c. F., along with Inverness, Forres, and Nairn, sends one member to Parliament. Pop. entire village and parl. burgh (each) 871.

Fort Royal' (properly Fort-de-France), fortress, seaport, and capital of the island of Martinique (French) in the West Indies. Its bay of the same name is said to form the best port in the Antilles. There are grand promenades, some fine edifices, an art school, a law college, and 17,190 inhabitants.

Fort St. Da'vid, formerly a maritime fortress of India, in the province of Madras, 1½ mile N. of Cuddalore. It was a strong position during the contests of the French and English, and was dismantled by the former in 1758, who restored it in 1783; but after it came into the possession of the British it fell into the ruined condition which it now presents.

Fort St. George ('white town'), the first fortified settlement of the British on the mainland of India, erected in 1639, and the nucleus of the present city of Madras (q.v.). It was captured by the French in 1746. Three years later the British re-entered it and forthwith improved the fortifications and made it as it now appears—a strong place, but not against modern artillery. The place is mainly occupied by government offices.

Fort Sumt'er, a celebrated stronghold of the Confederates during the War of Secession in S. Carolina, U.S., on the S. side of the entrance to Charleston inner harbour, and 3 miles from the city. It was begun in 1829, and at the time of secession was not completed, and only a few of the guns were mounted. It was held by a small body of troops under Major R. Anderson. Occupying a commanding position in the harbour of Charleston, it early became the centre of interest. The civil war was begun here by the Confederate batteries of General Beauregard on the 12th of April, 1861, and the fort was surrendered on the following day. It was held undisturbedly for two years, repulsed a force of nine Northern ironclads, 17th August, 1863, was partly demolished by the land batteries, but was not evacuated till the final surrender of Charleston, 18th February, 1865.

Fortu'na, among the Greeks **Tyche,** was the goddess of chance or luck. She was extensively worshipped in Greece and Italy, and was held in special honour at Rome. The Romans applied to her numerous epithets, such as *publica, privata, muliebris, conservatrix, regina*, indicative of the circumstances under which, and the persons to whom, she showed favour. F. was represented with a rudder, an emblem of her guiding power, and with a globe, to express her mutability.

For'tunate Is'lands. See CANARIES.

Fortuna'tus, the hero of an old popular story, who after undergoing great sufferings, obtains a wishing cap and exhaustless purse of gold, which eventually ruin F. and his sons. The story is of German origin, and has been recast in various forms in most of the languages of Europe. Its author is unknown, but F. seems at first to have been identical with Fortunio, another character in popular tales. The first printed edition of the story appeared at Augsburg in 1509. A Danish version was published at Copenhagen in 1664, a French at Rouen in 1670, an Italian at Naples in 1676, an Icelandic about 1690, and a Swedish in 1694, and a Dutch version at Amsterdam in 1796. The tale was dramatized in Hans Sachs' *Der F. mit dem Wunschseckel* (1553), and in Dekker's *Pleasant Comedie of Old F.* (1600). The tale is related poetically in Tieck's *Phantasus* (Berl. 1816), and the exhaustless purse reappears in Chamisso's story of *Peter Schlemil*, who sold his shadow for it.

For'tune, Robert, a Scottish botanist, was born in Berwickshire, 1813, and was engaged at the Botanical Gardens of Edinburgh, and later at those of Chiswick. In 1842 he was sent by the Botanical Society of London to N. China, and the result of his visit appears in *Three Years' Wanderings in China* (1847). He spent other three years in China in the interest of the East India Company, and produced his *Two Visits to the Tea Countries of China* in 1851. This was followed by his *Residence among the Chinese Islands on the Coasts and at Sea, being the Third Visit*, 1853-56. In 1859 F. collected in China for the United States Patent Office the seeds of the tea-shrub and other plants. His work, entitled *Yedo and Pekin* (1863), treats of the natural products of Japan and China. Died 16th April, 1880.

For'tune-Telling. Every person pretending or professing to tell fortunes, or using any subtle craft, means, or device, by palmistry or otherwise, to deceive and impose on any of Her (His) Majesty's subjects, is to be deemed a rogue and vagabond, and any Justice of the Peace may commit the offender (being thereof convicted before him by his own confession or by the evidence on oath of one or more credible witness or witnesses) to prison with hard labour for any time not exceeding three months (see statute 5 Geo. IV. c. 83). This law also applies to Scotland (by statute 34 & 35 Vict. c. 112) where F.-T. was at one time punishable by death but afterwards by imprisonment for one year and compulsion to find a surety for future good behaviour.

Fortu'ny, Mariano, a modern Spanish painter, was born of poor parents at Reus, near Barcelona, 11th June, 1839. His first experience in art was gained by assisting his grandfather, a showman, to paint wax figures. Later he studied at Madrid, and made two journeys through Marocco during the Spanish war, producing a vast number of oil and water-colour drawings. On his return he painted, on commission of the Spanish Government, his great picture, 'The Battle of Tetuan,' which procured for him a high reputation as a bold, original draughtsman, and a master of sunny, scintillating colour. He eventually settled at Rome, where he founded a school which sought inspiration from nature, and threw discredit on the 'Masters.' His splendid studio latterly became one of the public sights on account of its rare collection of enamels, ceramics, tapestries, &c. He died 21st November, 1874. Among his best-known works are 'The Beach at Portici' (sold for £3952), 'The Siesta,' 'Academicians of Arcadia,' 'Marriage in the Cathedral of Madrid,' 'Snake-charmers,' and 'Madrid Procession Caught in the Rain.' He mainly held to Southern or Oriental *genre* painting. 'Le joli F.' was a perverted genius, cynical and frivolous, whose theatrical subjects lack the genuine feeling of humanity, and whose execution is always more or less feverish and flashy. He was influenced banefully by the artistic necromancy of his brother-in-law, Madrazo, and fell under the weird spell of Gérôme. The criticism of Théophile Gautier greatly helped to raise to a fabulous height the price of F.'s pictures. The works left unfinished at his death alone brought over £16,000. See *F., sa Vie, son Œuvre, sa Correspondance*, by Baron Davillier (Par. 1875).

Fort Wayne, a city and capital of Allen county, Indiana, U.S., situated at the point where the St. Joseph and St. Mary form the Maumee river, 94 miles S.W. of Lake Erie. It is a great railway centre, having the workshops of the Pittsburg, Fort Wayne, and Chicago Railway. The Wabash and Erie Canal (1840) passes through it. F. has manufactures of machinery, agricultural implements, boilers, woollen goods, leather, cabinet works, &c.; also several charitable institutions and excellent schools. About 7 millions of dollars are invested in the industries of F. W., and of these railway cars, &c., are produced annually to the value of $1\frac{3}{4}$ million of dollars; foundry work, $1\frac{2}{3}$ million; carpentering, $\frac{1}{2}$ million, &c. The city derives its name from General Wayne, who built a fort here in 1794. It possesses three splendid parks. Pop. 35,393.

Fort Will'iam (Gael. *Inbher Lochaidh*, 'the mouth of the dark river'), a burgh and fort in the county of Inverness, at the S. end of the Caledonian Canal, 63 miles from Inverness. The fort was first built by General Monk, rebuilt by General Mackay in 1689, and called Fort William in honour of King William. It is an irregular work, but withstood a siege by Prince Charlie's forces in 1745. It contained accommodation for 100 men. Like Fort Augustus, it has been sold by the Government, and is now occupied as private dwelling-houses. F. W. (under the Lindsay Act), originally called Mary Burgh, afterwards Gordon's Burgh, contains a pop. of 1870, a public school, banks, and several churches. Lying at the foot of Ben Nevis it is very much frequented by summer tourists.

Fort William, the citadel of Calcutta (q.v.). The original fortification was erected in 1696, but was abandoned after the sack of the city by the Nawab Seraj-ud Dowlah; the present building dates from 1773.

Fo'rum (akin to *foris* and *foras*, hence 'that which is out of doors') meant originally a clear open space, and was applied specially to the central area in towns which in ancient times served as a market-place, and also as a place for the discussion of public affairs and the administration of justice. At Rome the F. was about 224 yards in length, and about

68 yards at its greatest breadth, stretching between the Capitoline and Palatine hills, and surrounded by spacious porticoes and the shops of bankers. It consisted of two parts, the Comitium, and the Lower F., occupying respectively one-fourth and three-fourths of the area. The Comitium was so named from having been the place of meeting of the Comitia Curiata, and contained the tribunal from which the prætor of the city administered justice, and the rostra, a platform from which public speakers addressed the people, and which was so called because it had been adorned with the *beaks* of ships won from the Antiates. In the Lower F. all general business was transacted, and the Comitia Tributa met. The famous Sacra Via was the boundary of the F. on the E. and N., entering near the temple of Vesta, and leaving at the Arch of Severus. Of the additional *fora judicialia*, erected by the emperors, the most important were the F. Julium and the F. Augustum, the works of Julius Cæsar and Augustus. There were numerous *fora venalia* in Rome, as the *F. boarium*, or cattle-market; the *F. olitorium*, or vegetable market; the *F. cupedinis*, or market for dainties, &c. F. was also the name of many market and assize towns, as F. Appii, F. Aurelium, &c.

Fosca′ri, Frances′co, a doge of Venice, familiar to English readers from Byron's tragedy. Born about 1372, he was doge from 1423 till 1457. Though during his long administration Venice was prosperous at home, and successful in the almost incessant wars undertaken by her energetic doge, the animosity of his enemies triumphed in compelling F. summarily and ignominiously to resign office in 1457. He had already lost three sons in battle, and had seen the fourth tortured and banished as a traitor. He was unable to survive the crowning calamity of 1457, and died immediately after his resignation.

Fos′colo, Niccolo Ugo, an Italian patriot, poet, and man of letters, borne at Zante, 26th January, 1777, was educated at Venice and the university of Padua. His first tragedy, *Tieste*, was performed with success at Venice in 1797. After Venice had become an Austrian town, F., still hoping great things for Italy from the soldiers of the republic, took service as an officer in the Lombard Legion at Milan, then capital of the Cisalpine Republic. He spent several years with the French army. F.'s first romance, *Ultime Lettere di Jacopo Ortis*, had appeared in 1802, and secured him a European reputation. The poem *I Sepolcri* was well received; and in 1808 F. was called to the chair of rhetoric at Pavia, which he occupied till the professorship was suppressed. The tragedies *Ajace* and *Ricciarda* were performed in 1811 and 1813. F. forsook Italy finally after the events of 1814, and soon settled in England, where he continued to be engaged in miscellaneous literary work, illustrative of Petrarch, Dante, and other great names of Italian literature. In spite of F.'s success as author and lecturer, the exile of this high-hearted but restless and impetuous Italian was embittered by pecuniary distress. He died at Turnham Green, 14th September, 1827. In 1871 his ashes were brought to Florence, amid public solemnities.

Foss′a and Fur′ca. See PIT AND GALLOWS.

Fossa′no (Lat. *Fons Sanus*, 'the healing fount'), a walled town of N. Italy, province of Cuneo, on the Stura, an affluent of the Po, and 32 miles S. of Turin by railway. It is the seat of a bishop (since 1580), and has a cathedral of San Giovanni, a castle of the 14th c., an academy of science and art, a veterinary college, and a theatre. F. has paper, silk, and leather industries, and a trade in corn, hemp, and cattle. F. was an important fortress in the 13th and 14th centuries. It was stormed by the French in 1796, and was taken by the Austrians, 18th September, 1799. Pop. 18,585.

Foss Dyke. See CANAL.

Fosse, or **Foss** (Lat. *fossa*, from *fodio*, 'I dig'), is the dry or wet ditch immediately surrounding the rampart of a fortification.

Foss′il (Lat. *fossilis*, from *fodere*, 'to dig'), originally anything dug out of the earth, but now limited to the remains of plants and animals found embedded in the rocks which form the earth's crust. These organic remains are found in all states of preservation, and are probably due to the replacement of the gradually-decaying organic matter by mineral products. Each stratum has its distinctive fossils or groups of fossils, which are consequently of the greatest value in fixing the age of the formations in which they occur. Without this aid, indeed, palæontology would have no existence, and geology would lose its most important component.

Fossil Ferns. The ferns or *Filices* are first certainly represented in a fossil state in the Devonian and Old Red Sandstone rocks. The Devonian F. F. present a close resemblance to the more luxuriant vegetation which prevailed in the succeeding Carboniferous epoch. The genera *Cyclopteris*, *Neuropteris*, and *Phenopteris* include smaller species, whilst trunks of tree-ferns are also found in Devonian strata, and are referred to the genera *Caulopteris*, *Protopteris*, &c. The former genus also occurs in Carboniferous strata, along with *Palæopteris* and other typical forms. The Coal period is very rich in smaller F. F. belonging to the genera already mentioned as occurring in the Devonian, and in addition to the genera *Pecopteris* (*Alethopteris*), *Odontopteris*, *Hymenophyllites*, &c. In the Permian rocks F. F. are abundant, but resemble those of the Coal period. Many Carboniferous genera also occur in the Trias, *Neuropteris elegans* being a characteristic Secondary form. In Tertiary strata F. F. are comparatively few in number, and are not represented in the profusion characteristic of the earlier formations.

Fossiliferous Rocks, a comprehensive term in geology, embracing all formations which contain organic remains. It is nearly synonymous with *Aqueous Rocks* (q.v.), though not unfrequently fossils are found embedded in volcanic tuff and similar fragmental rocks.

Fossombro′ne (the Roman *Forum Sempronii*), a town and bishop's see in Central Italy, province of Pesaro-Urbino, in the valley of the Metauro, and on the *Via Flaminia*, 16 miles W.S.W. of Pesaro. It has an old castle, and a cathedral, in which are many ancient inscriptions, besides the remains of a Roman theatre and bridge. The Metauro is here spanned by a modern bridge. F. produces the *Seta della Marca*, celebrated as the finest silk in Europe. Near F. Hasdrubal was defeated and slain by the Romans in 207 B.C. Pop. 9300.

Fos′ter, Birket, an English artist, was born at North Shields in 1812. He was educated at Hitchin, Herts, and after practising wood-engraving for some time with Landells, became a draughtsman, in which capacity he early showed an aptitude for the sympathetic treatment of rich pastoral and river landscape. His illustrations of the poetical works of Goldsmith, Cowper, and Scott, of Beattie's *Minstrel*, of *Evangeline*, &c., are artistic gems, crisp yet fluent in drawing, and in chiaroscuro singularly brilliant and true. F. won a high reputation for water-colouring, but his lush bosky dells and bright sunny glades leave an impression more of airy daintiness than of great artistic strength or study. He was elected a member of the Water Colour Society in 1860.

Foster, John, an eminent English essayist, was born in Halifax, Yorkshire, 17th September, 1770. For a brief period he was a weaver, but studied for the Baptist ministry at the Bristol College, and preached at Newcastle-upon-Tyne, Dublin, Downend, and Frome; but although his preaching was universally admitted to be able, it was not successful, and he gave himself up finally to literature. His great work is *Essays, in a Series of Letters*, published in 1805, when he was at Frome, and which have been much admired for their powerful if somewhat rugged thinking, and occasional imaginative outbursts. Marrying in 1808, he retired to lead a life devoted to literature and study at Bourton-on-the-Water, in Gloucestershire, preaching only at intervals. His chief work for eighteen years was writing papers for the *Eclectic Review*, his contributions to which, 'Biographical, Literary, and Philosophical,' were published in 1840. Among his other productions, the chief are *Essay on the Evils of Popular Ignorance* (1819), occasioned by his return to Downend in 1817, which first awoke the British nation to the perfect barbarism that prevailed in certain country districts; *Lectures delivered at Broadmead Chapel, Bristol* (1844 and 1847); and *Introductory Essay to Doddridge's Rise and Progress* (1825). F. died at Stapleton, near Bristol, 15th October, 1843. *The Life and Correspondence of F.*, edited by J. E. Ryland, was first published in 1846.

Fou'cault, Jean Bernard Léon, a French savant, was born at Paris, 18th September, 1819. Though educated as a physician, he devoted his life to experimental research in the physical sciences, and had charge of the scientific section of the *Journal des Débats* from 1845 till his death, which took place at Paris, 11th February, 1868. He is widely known for the calculation of the velocity of light by means of a revolving mirror, and the establishing by direct comparison of the velocities of light in air and water the undulatory theory over the emission theory; for his invention of the Gyroscope (q.v.), and the application of it, as well as of the simple pendulum, to render the diurnal rotation of the earth evident to the bodily eye; and for his electric light apparatus, with the electro-magnetic regulator. F.'s memoirs are published in the *Comptes Rendus*, and some popular scientific treatises appear in the *Bibliothèque d'Instruction Populaire*.

Fou'ché, Joseph, born near Nantes in 1763, first appeared in public life in 1792 as member of the National Convention for Loire-Inférieure. Though a friend of Condorcet and Vergniaud, he showed much 'patriotic ferocity' in voting the king's death, in carrying out the 'Law of Suspects' in the W., and in suppressing with Chaumette the Catholic religion. At Lyon he and Collot d'Herbois perpetrated the judicial murders of which he afterwards ignobly tried to throw the blame on his enemy Robespierre. He was rewarded by the president's chair in the Jacobin Club. By lying and treachery, he survived the Reign of Terror, after which he curried favour with Director Barras by the betrayal of Babeuf's conspiracy. In the Ministry of Police, which he entered in 1799, he found the congenial task of suppressing the Jacobins, whom he had once led. The consuls being established, F. adopted milder measures, especially with regard to royalists, but his administration was disgraced by embezzlement on a grand scale. In 1802 F. was dismissed, the Ministry of Police being suppressed. The office and the man were restored under the Empire in 1804. Meantime F. resisted the murder of D'Enghien and saved the life of Moreau. To the former he applied the famous words—'It is worse than a crime; it is a blunder.' For several years F.'s administration of internal affairs was able, moderate, and popular. In 1809 he was made Duc d'Otrante; and was so popular that Napoleon became suspicious. In 1810 F. was replaced by Savary. He never recovered Napoleon's confidence, but was offered the Ministry of Police by Louis XVIII. in 1814. He resumed office during the Hundred Days, all the while maintaining friendly secret relations with leading royalists. In the Declaration of 1815 he unsuccessfully tried to obtain a recognition of the sovereignty of the people. After Waterloo F. was a member of the Provisional Government of Five, and arranged with De Vitrolles and Talleyrand the entry of the Bourbons. Once more Minister of Police, he exerted himself to reduce the list of proscriptions from 3000 to 57. Among these 57, however, were many of his old companions. This assumed moderation enraged the royalists, and F. was forced to resign. He was, however, appointed ambassador at Dresden, but four months later, in 1816, was compelled to retire from the post under the law of 12th January, which incapacitated from holding office all who had voted for the death of Louis XVI. He then lived for two years at Prague, became a naturalised Austrian subject, and died at Trieste, 25th December, 1820. As regards his moral character, we may say with Robespierre—'He was a miserable impostor.'

Fougères', an old town in the department of Ille-et-Vilaine, France, at the confluence of the Nançon and Couesnon, 35 miles N.E. of Rennes by railway. It is overlooked by a ruined castle of the 12th c., has many quaint arcades, and is famous for its scarlet dye, the delicate tints of which are ascribed to the Nançon waters. Pop. of town 18,221; of arrond. 90,213.

Fou'la, an outlying island of the Shetland group, 32 miles W. of Lerwick. It is an almost inaccessible sandstone and granitic mass, the haunt of myriads of sea-fowl, some 3 miles long, rising, in parts precipitously, 1285 feet above the sea. The inhabitants are chiefly engaged in fishing. F., which may be seen from Orkney, is supposed to be the ancient *Ultima Thule.* It is surrounded by dangerous rocks. Pop. 239.

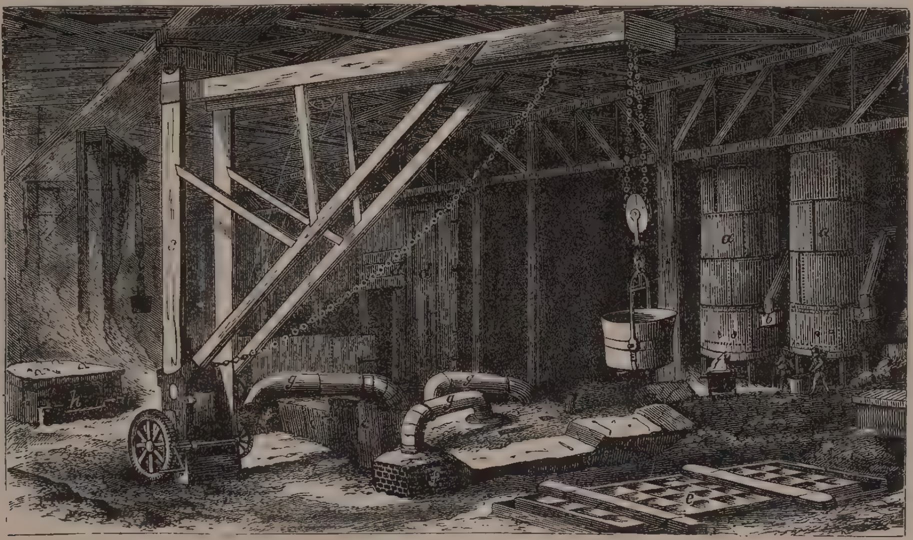
Fould, Achille, a French statesman, born at Paris, 17th November, 1800. He was the son of a rich Jewish planter, and after travelling in Italy and the East, was returned to the Chamber of Deputies in 1842, and again in 1846. He was a member of the Constituent Assembly in 1848, and of the Legislative Body in 1849. Under the presidency of Louis Napoleon he was three times Minister of Finance. In this post he showed great ability and disinterestedness, and though he repeatedly resigned from disapproval of Louis Napoleon's conduct, he was, after the *coup d'état* of 1851, appointed a senator and minister of state. In 1852 he was made Commander of the Legion of Honour, and from 1861 to 1867 was again Minister of Finance. F. died at Tarbes, 5th October, 1867.

Foul'is, Robert and Andrew, two celebrated Glasgow printers, born, the one 20th April, 1707, the other 23rd November, 1712. Robert was originally a barber with a good business, but under the advice of Dr. Francis Hutcheson, Professor of Moral Philosophy in Glasgow University, whose class he had attended, became a bookseller. The first work that brought him into reputation was an edition in Greek of *Demetrius Phalereus on Elocution* (1742). Next year he was appointed printer to the University, and soon after took into partnership his brother Andrew. During the next thirty years there followed a succession of classical reprints—Latin, Greek, English—among which may be mentioned Horace, Cicero, Homer, Herodotus, Milton, Pope, and Gray. Some of these were models of accuracy and elegance. Andrew died in 1775; Robert, in 1776. The sons of the latter maintained for some time the reputation of the firm.

Founda'tion (from the Lat. *fundus*, 'a bottom or basis'), a word applied both to the lowest part of any building or structure, and to the ground upon which it rests. The walls of a building are increased in thickness at the bottom —step-wise—in order to distribute the pressure due to the superincumbent masonry over a considerable area. Where the ground below is rock, no further preparation is needed than dressing its surface approximately level, or into a number of horizontal beds at different levels, if the surface slopes greatly. In ordinary cases, however, foundations have to be made upon material which is not only soft in itself, but which is liable to be rendered softer by the permeation of water. In these circumstances it is usual to provide a hard and impermeable base for the masonry or brickwork, and at the same time to extend the area over which the pressure acts, by putting down a layer of concrete of a thickness and breadth proportioned to the weight of the building and the nature of the soil underneath. *Submerged* foundations, such as those for bridges, piers, &c., frequently present great difficulties to the engineer.

Found'er, a name given to an inflammation of acute type of the laminar structures of the horse's foot, resulting usually from over-exertion. Occasionally the affection may appear as the result of derangement of the digestive system. The fore-feet are those most generally affected, but the disease is sometimes found in both fore and hind feet. The symptoms consist in heat and swelling of the feet, and in the inability of the horse to stand upon the affected feet. The treatment must first be directed to the removal of the inflammatory symptoms by antiphlogistic remedies. The shoes are to be removed and the hoofs pared. Bleeding may be indicated, and the feet must be poulticed with bran-bags. Aperients may be freely administered, and if pus forms in the foot, it must have free vent given to it by incisions. Mild blisters may be afterwards required to reduce swelling.

Found′ling Hos′pitals are institutions for the nurture of children abandoned by their parents. It has been a much-mooted question whether or not the laws of political economy sanction the endowment of F. H.; the argument of the opponents of these institutions being that they promote immorality, the parents being relieved of the charge of maintaining the child resulting from it. If it were the rule of the institution to receive no child unless deserted by its parents, this argument would have no more force against the maintenance of F. H. than it has against the present law of England, which obliges the *parish* to maintain a deserted child. It may be doubtful whether the law of political economy carried out in full rigour would sanction any general system for the keeping alive of deserted children; because there can be no doubt that the existence of such a system does promote immorality, for the reason above stated. But the laws of political economy apply only to the *wealth* of nations, and human benevolence and moral culture frequently require a mitigation of these. And they do require it regarding the matter in question. We could not see helpless children dying of hunger. We think, therefore, that under wise management F. H. are at all events harmless institutions. They simply relieve an individual, a parish, or a state, of a pecuniary burden. France, Germany, Italy, Spain, Austria-Hungary, Sweden, Belgium, Russia, China, Mexico, Brazil, and the U.S. of America possess F. H.



Interior of Iron Foundry.

Foundling Hospital of London, The, was established by Captain Coram in 1739 as 'an hospital for the exposed and deserted children.' The applications for admission soon became most numerous, and in 1754 the governors of the hospital were compelled to appeal to Parliament for assistance to carry on the establishment, which had then become filled. The King supported the appeal and Parliament responded generously. A basket was placed beside the gate with a notice to the effect that all children under two months of age would be received. Within less than four years so many as 15,000 are said to have been handed over in this way to be brought up in the hospital or in the nursing establishment connected therewith. A high death-rate among the children (68-72 per cent.) caused Parliament to interfere by cutting off the grant, and the governors, left to their resources, put a stop to this indiscriminate reception of abandoned children, and adopted another system, under which every child would be received without question, provided £100 were sent with it. In 1801 this system was also abolished, and the present one took its place. Under this the application must be made after the birth of the child and before it is twelve months old. The committee of management must then be satisfied that the father has deserted both child and mother, and that the relief thus extended to the mother, by taking her child off her hands, will help her to regain her position and to earn a livelihood honestly and properly. The child of a widow or married woman is not received. The boys are trained as mechanics till they are fourteen, the girls as domestic servants till they are fifteen years of age. Deformed and chronically infirm members of the hospital are after these ages assisted, or maintained altogether when necessary, from the funds of the institution. It would be difficult to find throughout the world a more truly benevolent institution than this, or one more deserving of the support of the friends of mankind or of the followers of the Master—the true and eager friend of all children, be the parents what they may.

Foun′dry (from the verb 'to found,' Lat. *fundare*, 'to flow out'), a place where metal in the shape of 'pig' or ingot is cast into the forms required in construction or the arts. In the common iron F., the metal (pigs broken into pieces) is melted in a Cupola (q.v.) furnace with coke as fuel, and then run into large buckets or 'ladles,' which are slung from cranes, and so can be easily and quickly moved from the furnace to any part of the F. The sand or loam moulds into which it is then poured are made as follows:—A wooden pattern is prepared, having externally exactly the form of the required object, but having projections or 'prints' on it instead of holes whereever that object has openings. If the object be hollow, a box is then made, called a 'core-box,' having *internally* exactly the same shape as the interior of the required object, plus the prints upon the pattern just alluded to. A mould is then made from the pattern in soft sand or loam (the *inside* of the mould having the same form as the *outside* of the object), and a 'core' is made of the same materials by means of the core-box (the *outside* of the core having the same form as the *inside* of the object); both mould and core are dried separately, and then the latter is placed inside the former, resting in it by means of the projections corresponding to the prints. The space between the core and the mould now corresponds exactly in form and thickness with the object to be cast. The whole is built up and strengthened as may be necessary (to prevent bursting); suitable air-holes and pipes are provided; and when all is ready, the molten metal is poured in. Sufficient metal is used, not merely to fill the space left between the mould and the core, but also to form a 'head' above the casting, which can afterwards be cut or broken off, and which will contain impurities and sponginess that otherwise would spoil the casting itself. After the metal has had time to cool, the mould is broken up, and the casting cleaned by the removal of the sand still adhering to it, and of burrs or conspicuous roughnesses.

The process of casting other metals than iron does not essentially differ from that described above. For brass or gun-metal an air-furnace takes the place of the cupola, and steel is most often melted in crucibles. With some geometrical forms, such as the cylinder, a complete pattern is not required, and in certain cases, when a number of copies of the same object are to be cast, the pattern is made of iron instead of wood.

Foun'tain (Fr. *fontaine*, Lat. *fons*), a jet of water springing up through a natural or artificial orifice in the surface of the earth in virtue of a hydrostatic law (see ARTESIAN WELLS); or a structure, usually decorated, from which water spouts forth, either by hydrostatic pressure, by the elasticity of compressed air, or by mechanical means. In Southern Europe, nearly all the water for domestic uses is drawn from public artificial fountains. Rome and Paris are noted for the number and beauty of their fountains, and the *Grandes Eaux* of Versailles are justly admired. London is exceptionally poor in fountains; those in Trafalgar Square are supplied from an artesian well. The Crystal Palace, at Sydenham, has one of its chief attractions in its fountains, and others of great beauty may be seen in the grounds of Chatsworth in Derbyshire. The Emperor F. at Chatsworth is the most remarkable *jet-d'eau* in the world; it rises to a perpendicular height of 267 feet.

Fountain, in heraldry, is one of the *roundels* formed of six alternate wavy lines, *argent* and *azure*, or more properly barry wavy of six. The F. is represented flat (Boutell and Aveling).

Fou'qué, Friedrich Heinrich Karl, Baron de la Motte, a German romance-writer and poet, was born at Brandenburg, 12th February, 1777. He served in the campaigns of 1793, 1794, 1795, and, after living in rural retirement, in the war of 1813. He spent the rest of his life at his estate of Nennhausen, at Halle, Paris, and Berlin, where he died, 23rd January, 1843. F. was an ardent romanticist, and wrote many tales on mediæval and Scandinavian themes, full of wild fancy, and written in a poetic style, of which the best known are *Sigurd*, the exquisite fairy-story of *Undine*, *Der Zauberring*, *Sängers Liebe*, and *Die zwei Brüder*. He likewise wrote many poems, dramas, &c. He has been blamed for the fantastic unreality of his conceptions, and the shadowiness of his characters. 'His heroes,' says Heine, are all iron and sentiment, without body or reason.' A selection of his works, edited by himself, was issued in 12 vols. (Halle, 1844-46). Carlyle has translated F.'s beautiful tale *Aslauga's Knight*. See Carlyle's notice of F. in *Miscellaneous Essays*.

Fou'quier-Tin'ville, Antoine Quentin, public accuser in the Reign of Terror, was born at the village of Hérouelles, department of Aisne, in 1747. He was educated for the bar, but led a dissipated life, and for misconduct lost a post he held as procurator at Châtelet. F. threw himself, however, with such vehemence into the Revolution, always giving his vote for death in the Assembly, that Robespierre made him public accuser. As such his name will be infamous for all time; he called the guillotine the coining machine of the Republic, and sent to it men of all opinions that came before him—Danton, Hébert, Camille Desmoulins, and even his master, Robespierre. Finally he himself was guillotined, 7th May, 1795.

Four'chambault, a town in the department of Nièvre, France, near the right bank of the Loire, 5 miles N.W. of Nevers by railway. It has large iron-foundries, forges, and smelting furnaces, and an extensive manufacture of arms. The Loire is here crossed by a suspension bridge. Pop. 6020.

Four'croya, a genus of Exogenous plants, allied to the Agaves (q.v.), and belonging to the natural order *Amaryllidaceæ*. The stamens are shorter than the corolla. These plants grow in tropical climates.

Four Evan'gelists, the most easterly four of the group of twelve islands known as the Twelve Apostles, lying to the W. of Magellan's Strait, 50° 30′ S. lat., 70° 5′ W. long.

Four'ier, François Marie Charles, born at Besançon, 7th April, 1772, was the son of a wealthy merchant, lost his father's fortune during the Lyon insurrection of 1793, and served for a short time in the army. Returning to commerce, he received, it is said, his first inspiration of social reform from seeing a vessel of rice sunk at Marseille in order to raise the market price of the remainder. His article in a Lyon newspaper on the Continental triumvirate and the final struggle between France and Russia attracted some attention. In 1808 he published his *Théorie des Quatre Mouvements*, followed in 1822 by his *Traité d'Association*, republished by his disciples as *Théorie de l'Unité Universelle* (1841). His whole life was now given to the propagation of his doctrine, and in 1826 he fixed himself at Paris, where he died, 8th October, 1837. In 1829 appeared *Le Nouveau Monde*, and in 1831 a violent attack on the 'charlatanism' of Saint-Simon and Robert Owen, in which he offered to reorganize society in two months, with a profit of 300 per cent. In spite of the strange nomenclature (sometimes hieroglyphics were used) in which it was presented, F.'s theory became very popular, especially among women. The earth was for 80,000 years to pass through certain stages of development, the normal population being 30,000,000,000, all of whom should be seven feet high, and live for 144 years. The spirit, as well as the body, would become perfect. There would be 37,000,000 Homers, Newtons, Molières. Not less striking the industrial progress. One result of the universal *remboisement* would be restoration to equilibrium of the climate, and this would cause the ice at the N. Pole to melt. Each human soul lived through the 80,000 years until the golden age, but having alternately an existence within and without the material world. The unscrupulous selfishness of capitalists is constantly denounced, and F. looks forward to a time when the whole race, with one language, one coinage, and one system of weights and measures, would be employed harmoniously in one organization of productive labour. His plan of reform was based on the transparent fallacy that psychological phenomena are amenable to the physical laws of motion. No institution—property, succession, marriage, the Church—was to be sacrificed. There are three forces, he says, in the individual—the desire for luxury, the tendency to separate in groups, the tendency to unity. On the combination of these depends the primitive group. By a gradual change of combinations the groups form a series, which finally compose the famous 'phalanx' of 1800 persons, chiefly pursuing different tasks of their own free will, on a piece of ground a square league in extent. There is what is pompously called an 'alternation of functions,' a protest against the mechanical effects of subdivided labour. The produce is partly profit on capital, partly wages for work, and partly given to talent. The scale of wages varies with the agreeable or disagreeable character of the work; but a minimum is first set aside for the subsistence of every person, whether capable of work or not. The capital may be owned in unequal shares. The phalanx would live in one building and have one store, so as to minimise the profits of distribution; but voluntary association in families would go on as before. The fundamental idea is that labour may and ought to be rendered attractive by the opportunity of free choice, and the prohibition of excess.

Fourier, Jean Baptiste Joseph, Baron, a French mathematician, was born at Auxerre, 21st March, 1768, became Professor of Mathematics at the Central School of Public Works in 1794, was one of the *savans* who accompanied Napoleon to Egypt in 1798, was appointed prefect of Grenoble under the Empire, but after 1815 lived a retired life at Paris, where he died 16th May, 1830. His great work is his *Théorie de la Chaleur* (Par. 1822), a work which abounds in mathematical investigations of the highest originality, and which introduced a new epoch in the study of the laws of thermal conduction and absorption. Of his other works may be mentioned his *Discours Préliminaire*, or preface to the *Description d'Égypte*, his *Recherches Statistiques de la Ville de Paris*, and a posthumous work, *Analyse des Équations Déterminées*, published by Navier in 1831.

Four Lakes, a beautiful chain of lakes in a fertile part of Wisconsin, U.S. First Lake, the lowest and smallest, is 3 miles by 2, having its outlet in Catfish River. The largest, called Mendota, is 6 miles by 4. Between it and Third, or Monona, stands the state capital, Madison.

Foveaux' Strait separates the South or Middle Island of New Zealand from Stewart's Island. At its narrowest point it is 17 miles in width.

Fow'ey, or **Foy**, a seaport in the S. of Cornwall, near the mouth of the river of the same name, 28 miles W. of Plymouth, with which it is connected by railway. It carries on active pilchard-fisheries, has a good harbour, and exports iron ore and 'china stone.' The ruins of St. Catherine's Castle, which was built in the reign of Henry VIII., are on the W. side. In the 13th and 14th centuries F. was a place of considerable importance and possessed many ships. Two forts guarded the entrance to the river, and a chain was stretched across between them. F. despatched 47 ships and 770 men to the siege of Calais in 1347, was partly burned by the French in 1457, and captured by Fairfax in 1646. Pop. reg. sub-dist. 7020; civ. and ecc. par. 1957.

Fowl (Old Eng. *fugel* and *fugol*; Fris. *fugel*; Swed. *fogel*; Dut. and Ger. *vogel*; from a verb signifying 'to fly'), a name sometimes given to any bird of large size, but usually restricted to Gallinaceous or Rasorial birds domesticated by man, as the common barndoor fowls, turkeys, guinea-fowls, &c. Such birds form a typical group of *Rasores* or 'scratchers,' are distinguished by their strong beak and claws, adapted for picking up seeds and for scratching in the ground respectively. The head is usually provided in the males with *wattles*, often brilliantly coloured and erectile. Fowls are polygamous, one male mating with several females. They form subjects of interest to the naturalist, from their susceptibility to variation under the hand of man. Their original habitat appears to have been E. Asia. The Bankiva jungle-F. is credited with being the progenitor of all our domestic breeds. This F. is a native of Java. The male closely resembles the English gamecock. Its comb and wattles are bright red, the *hackles* or drooping feathers of the head and neck orange-red, and the upper part of the back a deep bluish-black. The tail, which is long and drooping, is also bluish-black, glossed with green, and the breast and underparts are black. The chief breeds or varieties of fowls which may be more or less clearly traced to the Bankiva stock are:—The Cochin-China F., whose ungainly aspect is so well known. Fabulous prices were given for pure-bred Cochins on their first introduction into this country, but the breed has now somewhat deteriorated from its frequent mixture with other varieties. The game-fowls were formerly greatly cultivated for the sake of their pugilistic qualities. The Polish fowls are known by the great plume of feathers borne on the head. The Spanish breed is a particularly fine variety, possessing a large comb, and a patch of white skin destitute of feathers below the ear. The latter variety is of large size, and is in high repute amongst poultry fanciers, from the regularity with which the birds lay. The Dorking fowls are short-legged birds, and have frequently one or more supplementary toes. The bantams are fowls of small size, noted for their courageous bearing, but rarely bred save as fancy fowls. The name common F. or barndoor F. has now come to denote a large number of fowls belonging to no special breed, but representing the effects of interbreeding between the preceding well-marked varieties. The typical F. is the jungle-F. of India, but it has had less influence in the formation of the domesticated breeds than was formerly supposed. At any rate, its peculiarities are seldom, if ever, seen in domesticated fowls in the same proportion as those of the Bankiva F.

Fowler, Sir John, Bart., K.C.M.G., LL.D., civil engineer, was born at Sheffield in 1817. He assisted in the construction of the London and Brighton and other lines, and was appointed engineer of the 'Underground' or Metropolitan Railway, and consulting engineer of the Great Western, Great Northern, Brighton, and Highland Railways. He was engineer-in-chief of the Forth Bridge and many other works, and has been also engaged in the construction of large docks. He was President of the Institute of Civil Engineers 1866-68. For his services as consulting engineer in the public works in Egypt he was made K.C.M.G. in 1885, and in 1890 was created a baronet.

Fowl'er's Solu'tion, or **Liq'uor Arsenica'lis**, a well-known preparation of arsenic and potassa introduced into medicine by Dr. Fowler, is used in various forms of skin-disease.

Fowl'ing, the name given to the killing of birds of various kinds, for the purpose of obtaining their feathers, flesh, or other products. This practice is carried on with much skill and daring, and in many different ways, in various parts of the world—*e.g.*, in the Faröe, Shetland, and Orkney Isles, Norway, Sweden, and other portions of N. Europe. The art of the fowler depended in former years much more on personal daring and prowess than in the present day. The introduction and general use of firearms have greatly aided and extended the capture of birds, although in some districts, from the nature of the birds to be caught, and from other considerations, the use of firearms is prohibited, and the pursuit of the birds is therefore attended with as much danger as before. Small birds are caught for the cage or for table by nets or snares of various kinds. But the exercise of the art of F. in its highest development can only be seen to advantage in rocky and inaccessible situations. In the northern islands, where such birds as gannets, guillemots, gulls, solan geese, and their allies are sought after and valued, not only for the sake of their feathers, but for their flesh and fat—the former serving as food, and the latter affording oil—F. is carried on by the hazardous proceeding of letting the fowler down the face of cliffs by means of a rope; and while thus slung in mid-air, he contrives to secure the eggs as well as the birds themselves. The ropes used are made of raw cowhide, and are very durable. A second rope is usually attached to the fowler for the purpose of giving signals to the persons on the top of the cliff, and for hoisting up the birds he secures. A simpler method of F. consists in securing birds by means of nets slung on the end of poles, but even in such a case the fowlers have to be let down the cliffs often for considerable distances.

Fowls of Warren. There would appear to be some difference of opinion as to the birds which may be placed in this category. Coke holds that the pheasant, partridge, quail, woodcock, mallard, heron, rail, &c., are F. of W.; but Manwood excludes all but the partridge and pheasant, and in the case Duke of Devonshire *v.* Lodge (7 B. and C. 36) it was decided that grouse are not F. of W. See FORESTS, CHASES, WARRENS, and PARKS.

Fox (Old Eng. *fox*, Dut. *vos*, Ger. *fuchs*; perhaps allied to the Old Eng. *feax*, 'hair,' and so signifying 'the hairy animal') is the name given to *Canis vulpes* or *Vulpes vulgaris*, a genus of Carnivorous *Mammalia* closely allied to the dog and the wolf, but distinguished by the elongated pupil of the eye. The ears are pointed and triangular in shape, and the tail very bushy. The dental formula is similar to that of the dog, the teeth numbering forty-two, and consisting of six incisors, two canines, eight præmolars, and four molars in each jaw. Minor characteristics may be found in the peculiar scent or odour proceeding from the secretion of the tail glands, this scent often furnishing a clue to the whereabouts of the animal. The colour of the common F. is a reddish fawn, mixed with black and white hairs. The fur is coarse, and grows very thick in winter. The tail is tipped with white. The average length of the body is about 2½ feet, and the height about 12 inches. The F. lives in burrows, which he excavates in the ground, or forms by enlarging some natural opening. The burrow generally winds in a complicated manner, the entrance often being made in a circuitous fashion between the spreading roots of a large tree. The cunning and intelligence of the animal have become proverbial. When hunted, it will adopt ruses of the most extraordinary kind to throw its pursuers off the scent—*e.g.*, it will feign death when captured by man, taking advantage of a relaxed guard to escape quickly and noiselessly. A tame F., which was on friendly terms with the dogs of the household, cheated the cats of their milk by simply walking round the cats' dishes, well knowing that the cats, which exceedingly dislike the vulpine odour, would not taste the milk, which thus fell to reynard. The same animal was seen to rub himself against the dairymaid's pails so as to impregnate the milk with his odour, a due supply of the useless fluid naturally falling to his share. The female F. produces from four to six at a birth, and breeds but once annually. Varieties of the common F. are numerous. The cur F. is a small variety, and the greyhound F. has more slender limbs and a better-proportioned body than the common F. The genus *Vulpes* as now constituted includes several other well-marked species of F. The American F., sometimes named the red F. or cross F., varies much in colour, but is most generally of a pale yellow hue. Its name of cross F. is derived from the almost invariable presence of a blackish stripe across the shoulders. The Arctic F. is celebrated for the glossy nature of its white winter fur, the summer fur being grey or greyish brown. This F. occurs, and is greatly hunted for its fur, in N. Europe and N. America. The soles of the feet are hairy, a peculiarity of structure which assists the animal to walk on the ice. The average length is about 3 feet. The asse or caama is a species of F. inhabiting S. Africa, the fur of which is highly valued. Other species are the black-bellied F. of S. Europe; the F. of the Himalaya slopes; the Deccan F.; the black or coal F. of Central Europe. The grey F. of Virginia is a commoner species than the American F., and exhibits all the characteristic traits of the British F.

Law Regarding Foxes.—Foxes may be pursued and destroyed as vermin even on the property of another, the only liability being the damage done in pursuit. In England by common law, and Scotland, fox-hunting for sport without leave is punishable as a trespass.

Fox, Charles James, a Whig statesman and orator, born 24th January, 1749, was third son of Right Honourable Henry Fox—created Lord Holland in 1763—and of Lady Georgiana Carolina, daughter of Charles Duke of Richmond, and was thus descended on one side from Charles II. He was educated at Eton and Oxford, had more Continental travel than most young men of his class, and before he had reached his majority was elected member for Midhurst, as a supporter of the Grafton Ministry. F.'s father, an old follower of Walpole, had left the Whig party, and F. began public life by supporting the absurd and unconstitutional defiance which the Commons, led by the Government, gave to the constituency of Middlesex, which had thrice returned Wilkes as member. Under Lord North's Ministry he was successively Lord of the Admiralty and Lord of the Treasury. A difference with the Premier on the Royal Marriage Bill was followed in 1774 by a serious quarrel relating to the censure of Woodfall, Horne Tooke's publisher. F. in consequence joined the Whig or Rockingham party, and came under the influence of Burke. This influence fixed and intensified his political principles, but though his reputation as an orator continued to grow, the scandal of his life (his father had recently paid £140,000 for the gaming debts of a single season) deprived him of moral leadership. He had, however, inherited the Walpole traditions of peace and civil liberty; and when in 1782 General Conway's motion for ending the American war was carried, and Rockingham, through the mediation of his rival Shelburne, constructed a cabinet, F. became Foreign Secretary. When Shelburne, the representative of Lord Chatham's policy, succeeded, F. with Keppel and Cavendish withdrew. By a junction of Lord North with the old Whig party a vote of censure was obtained (February, 1783). The Portland or coalition Ministry which followed was wrecked by the animosity of the King to F.'s East India Bill. From 1784 to 1792 F. was therefore reduced to the leadership of a powerful opposition to Pitt, and delivered great speeches on the Westminster Scrutiny, the Regency Bill, the Libel Bill, and the Russian Armament. He spoke with great effect against the abatement of impeachment by dissolution of Parliament, by which legal fiction it was attempted to defeat the trial of Warren Hastings, of which F. was a manager. In 1789 he moved the repeal of the Test and Corporation Acts, and supported Wilberforce in his holy crusade. The taking of the Bastille was hailed by him 'as the best event the world had seen.' The debate on the Quebec Government Bill (1791) severed the friendship that had so long existed between him and Burke. The Reign of Terror must have caused hesitation in the most sanguine minds; but F. from 1792 to 1797 vigorously pled the cause of peace with France. In 1795 he led the agitation against the Treason and Sedition Bills. He seconded the Grey motion for reform, called attention to the grievances of the Irish Catholics, and exposed the tyranny of Crown and Bench in the Scotch cases of Muir and Palmer. Though thoroughly persuaded of the advantages and necessity of party government, he retired into private life in 1797, saying that the House of Commons had ceased to discuss. His time until 1802 was occupied with literature and sport, and the beginning of his *History of James I.*, which he intended as an antidote to the brilliant misrepresentations of Hume's Charles I. After the death of Pitt, in January, 1806, F. again became Foreign Secretary under Granville. A further negotiation for peace, the passing of the Limited Service Bill, and a resolution to abolish the slave trade, were the fruits of this short season of power. He died 13th September, 1806. Opinions have varied much as to F.'s true character. Walpole describes him as first in Parliament, at Newmarket, and at the gaming-table. Pitt spoke of him as a magician. Mackintosh and Burke have confessed the splendid power of his passionate speech. Hazlitt and Bulwer Lytton accuse him of deserting Lord North through pique. He was doubtless the great champion of parliamentary freedom at a critical time, and Catharine II. did right to place his bust with those of Cicero and Demosthenes. He had the instinct of civil and religious liberty, and Villemain truly says he was the only English statesman who understood the French Revolution. His speeches were edited by Erskine (Lond. 1815). See Lord John Russell's *Life and Times of F.*, and *Memorials and Correspondence of F.*

Fox, George, the founder of the Society of Friends (q.v.) or Quakers, born at Drayton, in Leicestershire, in 1624, was first a shepherd and afterwards a shoemaker. About the age of nineteen he became deeply convinced that he had received a special call from God, and began to wander through the country rapt in religious dreams. His garb was somewhat grotesque, consisting of a single garment of leather made by himself. About 1646 he resolved to give up attendance on Church ordinances, and content himself with the teaching of the 'Spirit.' Two years later he appeared as a preacher at Manchester, urging men to trust in the 'inner light,' and to cast aside as useless or pernicious the forms and ceremonies of worship. This was the burden of all his discourses. For upwards of forty years he may be said to have done nothing else than beseech men in a pathetic, wistful, and half-bewildered fashion to have faith in the 'inner light.' The dogma-loving Puritans could not endure his wayward mysticism, and in spite of the fine moral simplicity and purity of his character, he and his 'people' suffered a great deal of persecution. In 1655 F. was brought to London, and had an interview with Cromwell, who recognised an honest soul under the 'leathern hull,' and dismissed him in a friendly way. In 1669 he married the widow of Judge Fell, one of his converts in Lancashire, after which he went to America, and on his return paid a visit to the N. of Germany. Before his death, 13th January, 1691, the 'Society of Friends' had acquired considerable importance. F.'s writings, including his curious autobiographical *Journal*, were collected and published in 1694-1706. See also the Biographies of Marsh, Janney, Watson, and Spurgeon.

Fox, sometimes **Foxe, John,** the martyrologist, was born at Boston, Lincolnshire, in 1517. Educated at Oxford, he was elected to a fellowship of Magdalen College, but having accepted the doctrines of the Reformation, was expelled from it, 22nd July, 1545. After some time he became a tutor, first in the family of Sir Thomas Lucy of Charlecote, and then in that of the Duchess of Richmond. In the reign of Edward VI., F. was ordained a deacon of the Reformed Church, but in that of Mary had to flee to the Continent, living for a time at Basel as a corrector of the press. Returning to England in the reign of Elizabeth, he held various offices in the Church, including a prebendal stall in the cathedral of Salisbury, and would have received further preferment, had he not been suspected of holding Nonconformist opinions, a belief strengthened by his refusal to subscribe to the Thirty-Nine Articles, and his interceding with the Queen for some Anabaptists who had been condemned to death. He died in 1587. F., who in early life had written some Latin 'Moralities,' one of which, *De Christo Triumphante*, was printed at London in 1557, and who was towards the end of his career a keen ecclesiastical controversialist, is remembered chiefly for his *History of the Acts and Monuments of the Church*, popularly styled *Foxe's Book of Martyrs* (first Latin ed. Stras. 1554; 2nd Latin ed. enlarged, Basel, 1559, of which the English translation of 1563 was made), which has gone through innumerable editions, and is still looked upon as one of the manuals of Protestant literature. The first idea of the work was suggested to him by Lady Jane Grey. The truth of many of its statements has been questioned by Catholic critics, who have styled it *la légende dorée de F.*

Fox, William Johnston, an orator and preacher, the son of a small farmer, was born at Uggeshall, near Wrentham, Suffolk, in March, 1786. He was educated for the Independent ministry, but went over to the Unitarians, and finally took an independent position as a Rationalist, preaching for some time at the South Street Chapel, Finsbury. He was one of the earliest members of the Anti-Corn-Law League, the object of which he advocated with great ability, both as a speaker and a writer. He was returned to Parliament in 1847 for Oldham, which he represented with short intervals until his death, in London, 3rd June, 1864. F. was a Radical in politics, a 'Theist' in religion, a clear and vigorous writer, and a singularly effective orator. His chief works are *Letters of a Norwich Weaver-Boy*, *Letters addressed chiefly to the Working Classes*—telling political pamphlets—and *Religious Ideas*. F. was a frequent contributor to the *Westminster Review* and other periodicals. An edition of his selected works was published in 1868.

Fox-Bats, the name applied to a family and section of *Cheiroptera* (q.v.) or bats. They are so named from the resemblance of the head to that of the fox. They are Frugivorous or fruit-eating, and possess a long pointed snout. The ears are of moderate size, and destitute of appendages. Incisors and cutting canine teeth are developed in both jaws. The F.-B. feed chiefly on vegetable matters, but they also subsist on small birds and mammals. The molar teeth have blunt tuberculate crowns. The tail is short or absent. Of the F.-B. the best-known species is the Kalong bat in the Eastern Archipelago, which attains an expanse of wing from 4 to 5 feet. The F.-B. are absent from the New World.

Fox'glove. See DIGITALIS.

Fox'hound. See FOX-HUNTING.

Fox'-Hunting, a thoroughly English sport, pursued with courage and ardour in the autumnal and winter months. It demands much organization, not only as regards the breed and quality of the dogs employed, but in the training and appointment of the men connected with the pack and with the management of the dogs in the sport. The horses employed in hunting require also a certain degree of training and breeding; the qualities which render a horse a first-rate hunter being courage, agility, and a certain fondness or disposition for the work. The management and control of the pack of foxhounds is vested in a gentleman named the *master*, the appointment being generally given to some prominent country gentleman, who is elected by the subscribers to the pack, and who holds office either for a stated number of years, or for such time as may suit his tastes and convenience. Under the master are the *huntsman* and several *whippers-in* or *whips*. On the former devolves the duty of attending to the health of the dogs, and of seeing that they are properly housed and fed. He also directs their journey to the field, and exercises supreme control over their movements in the chase. The huntsman, in fact, is the active director of the sport, and is regarded as the leading character in the field, and as one whose directions all are expected to follow. The *whips* are so named from the fact that part of their duties consists in 'whipping' or bringing up lagging hounds to the front. But this duty — discharged in some instances by the second whipper-in—is a very subsidiary one in the office of *whip*, and this latter official may be said to be simply a qualified assistant to the huntsman himself. The dogs used in hunting the fox are named foxhounds, and 'Stonehenge' has justly remarked that 'the modern foxhound is one of the most wonderful animals in creation.' His acute scent, his wonderful sagacity in comprehending the difficulties of any position in the field, his efforts to circumvent the natural cunning of the fox, his speed and power of endurance, form traits which only require mention to be thoroughly appreciated. The breeding and training of foxhounds are tasks of no ordinary difficulty; the modern foxhound representing in itself a combination of a great variety of breeds. The average height of these dogs, in their thoroughbred state, is from 20 to 25 inches, and those forming a pack are usually selected of the same height. Their speed is sometimes very great. 'Bluecap,' a famous hound, ran over the Beacon course at Newmarket—a distance of 4 miles, 1 furlong, and 132 yards—in 8 minutes and a few seconds. The racehorse 'Flying Childers' ran the same distance in about 30 seconds less time. The country best adapted for F.-H. is that in which level and undulating ground, with a fair mixture of pasturage and plantation, are intermingled. The 'earths' or burrows of the foxes are duly 'stopped' by the *earth-stopper* or gamekeeper on the night preceding the hunt, after the foxes have left their dens on their nocturnal foraging expeditions. The foxes, shut out of their homes, usually seek refuge in thickets, and the localities of the 'stopped' earths being duly noted, the efforts of the huntsman are directed to these spots. The huntsmen and the hounds being assembled in the neighbourhood of the coverts, the dogs are 'thrown off,' and are encouraged to seek the fox in his temporary lair, the huntsman and whip following the pack. The master's duty chiefly consists in regulating the acts of the riders, in conformity with the huntsman's operations. Occasionally the riders may assist in searching the covert, and those outside watch eagerly for the first symptoms on the part of the hounds of having found or 'scented' a fox. Some old hound acts as leader, and betokens the presence of the fox or scent by a peculiar whimper. Sometimes a fox may be at once seized and *chopped* or torn to pieces, before he can escape; an incident which is of course a catastrophe so far as the sport is concerned. Sooner or later the fox leaves or *breaks cover*, and is allowed to gain a certain distance from the hounds. The person who notices his escape then gives the *View halloa!* as the warning cry is named. The *Tallyho!* of the huntsman is then heard, and the hounds are called together by the sound of the horn, while the whips collect the stragglers. Speedily the dogs *settle* to their work, and the pack, accompanied by the riders, are soon in *full cry* after the quarry. The sport thus begun continues to increase in excitement, the chase leading the huntsmen over mile after mile of country, quickly or slowly as the scent is good or fails. In the latter case the dogs are said to be *at fault*, the sportsmen in such a case remaining at some distance, while the huntsman endeavours to set them once more on the scent. If the scent be recovered the chase is resumed; but if it be lost a fresh fox is drawn. The rider first *in* at the death of the fox lashes the hounds off, and secures the head, feet or *pads*, and tail or *brush* of the fox. Both in England and in Ireland the pastime of F.-H. is very popular, and in some parts of Wales and Scotland some hunting is carried on every year. The grass counties of England are the localities where it meets with the greatest success and where large sums of money, amounting to thousands of pounds, are annually spent on hounds and their maintenance.

Fox River, the name of two streams in the United States, both rising in Wisconsin, the more important of which, also known as the Neenah, is connected by canal with Wisconsin River, flows into Green Bay, after a course of 150 miles, is improved by means of a system of locks and jetties, and forms the connecting link between the great lakes and the Mississippi and its tributaries. The other flows S. and S.W. into the Illinois River, provides ample water-power, and has a course of 200 miles.

Fox-Shark, a species of shark, also known as the 'thresher-shark,' from the excessive development of the upper lobe of the tail, which is thus more typically *heterocircal* or unequally lobed than in other sharks. This fish occurs in the Atlantic Ocean and Mediterranean Sea, and has been frequently found off the English coasts. It attains an average length of 12 or 13 feet. Its food consists of herrings and other fishes. The colour is slaty blue above, and the same hue mottled with white prevails on the under parts. The snout is shortened and conical, and the gill-openings are small, the hinder gill-slit being placed over the pectoral fins. The teeth are flat and three-sided. The tail is used as a defensive weapon. The other names applied to this fish are *sea-fox* and *sea-ape*.

Foxtail-Grass, a genus of *Gramineæ* or grasses having a *spiked panicle* of flowers with equal *glumes*. The meadow F.-G. is a familiar meadow-grass, and attains a height of from 1 to 2 feet. Another species is the jointed F.-G., which has its culm bent at the joints. The slender F.-G. grows favourably on sandy and dry soils. The black F.-G. is a European and a N. Asiatic species, which thrive in Britain.

Foy, Maximilien Sébastien, a French general and orator, was born at Ham, in Picardy, 3rd February, 1775. He first served in 1792 under Dumouriez, and subsequently under Moreau, Massena, and finally Napoleon himself, gaining distinction by his daring bravery. Although opposed to the ambition of Napoleon, his ability was such that he was promoted to high and important commands. He successfully defended Constantinople in 1807 against Admiral Duckworth, became brigadier-general in Portugal in 1808, fought at Salamanca in 1812, was severely wounded at Orthez in 1814, and received his fifteenth wound at Waterloo. Retiring from military life, F. was elected in 1819 member of the Chamber of Deputies for the department of Aisne, and became very popular on account of his advocacy of constitutional liberty, his eloquence, and his political and economical knowledge. His health broke down, however, and he died at Paris, 28th November, 1825. In 1826 appeared two volumes of his speeches, with a biography, and in 1827 his unfinished *Histoire de la Guerre de la Péninsule*, edited by Madame F.

Foy'ers, a mountain stream in Inverness-shire, rises in the Monadhliadh mountains, flows N. through Strath Errick, and enters Loch Ness, 10 miles N.N.E. of Fort Augustus, after a course of 15 miles. It is famed on account of the two falls near its mouth, 90 and 30 feet high respectively, the former of which is a magnificent cascade, romantically hidden in a wild gorge.

Foyle, Lough, an extensive arm of the Atlantic in the N. of Ireland, separates Donegal from Derry, is of triangular shape, and has a length from N.E. to S.W. of 16 miles. It contracts at its mouth to 1 mile, is navigable to vessels of 200 tons along its W. side, but on the E. is very shallow. On the flat eastern beach was measured the base line of the Irish survey. The Belfast and Northern Counties Railway runs along its S. and E. shores.

Fra Angel'ico (often named *Giovanni da Fiesole*, but whose baptismal name appears to have been *Giovanni Guido Santi-Tosini*) was born at Mugello, a few miles N.E. of Florence, in 1387. In 1409 he entered the order of Predicants at the convent of Fiesole, and lived there eighteen years, during which he beautifully illuminated many of the books used in the choir, and painted a large number of frescoes and easel pictures in distemper. Invited to Florence in 1436, he there decorated the convent of San Marco and other public edifices with frescoes. About 1445 Pope Eugenius IV. called him to Rome to decorate a private chapel in the Vatican and the cathedral of Orvieto with frescoes. At the command of Niccolo V., the successor of Eugenius, and a liberal patron of the arts, F. A., leaving his works unfinished at Orvieto, repaired to Rome to decorate a chapel to be used as the Pope's private oratory. There he spent the remainder of his days, and died in 1455. He was offered the archbishopric of Florence by Niccolo, but declined it on the plea that to govern or to lead were equally incompatible with his nature. His art is distinguished by an ecstatic reverential sentiment, the truth and purity of which made his works the model for religious painters of his own and succeeding generations. Every work he began with prayer, and every original idea was welcomed as a divine inspiration. F. A. may be studied to most advantage in the convent of San Marco, Florence. Here are his 'Christ Appearing to St. Dominic,' 'The Image of St. Thomas Aquinas,' 'St. Peter the Martyr,' a 'Christ,' in which the expression of the features reaches the sublime. Here also is his greatest fresco, the 'Passion,' a work embracing twenty-three large figures, with Christ in the centre, and saints and founders of religious orders ranged below. Placed around are numerous figures and medallion portraits. All these works are in excellent preservation. Vasari has said that F. A.'s saints and angels 'must look the same in Heaven.' The chapel of Niccolo V. is decorated on three sides with frescoes illustrating the lives of St. Stephen and St. Lawrence, works unrivalled in finish and in sweetness and harmony of colour, and evincing a command of light and shade which almost justifies the opinion that in chiaroscuro F. A. anticipated Correggio.

Fracasto'ro, Girola'mo, a physician and poet, distinguished for his miscellaneous learning, was born at Verona in 1483. At the age of nineteen he was Professor of Dialectic at Padua, where a bronze statue was erected in his honour, as was also a marble one at Verona. His most famous work is a poem in three books, in excellent Latin verse, published at Verona in 1530, and frequently reprinted. Other works are *De Vini Temperatura*, *De Sympathia*, &c. F. died 8th August, 1553. His *Opera Omnia* were published at Venice in 1555.

Frac'tion (Lat. *fractio*, 'a breaking into parts'), in arithmetic, is one or more aliquot parts or sub-multiples of unity. For instance, divide any magnitude into *eight* equal parts, and take *five* of these parts: this quantity is the F. *five-eighths*, and is written $\frac{5}{8}$, the lower number being termed the *denominator* and the upper the *numerator*. Such an expression as $\frac{11}{8}$ is termed an *improper* F., because it is greater than unity, being really *one* and $\frac{3}{8}$. It is immaterial whether we regard $\frac{5}{8}$ as being *five* of those parts, *eight* of which make up unity, or as being the eighth part of five units. It is this latter conception which is chiefly present to the mind in algebra, in which a F. is simply a symbol of division, $\frac{a}{b}$ being equivalent to and treated as $a \div b$. From this definition the following rules for the four fundamental operations with respect to fractions follow naturally: $\frac{a}{b} + \frac{c}{d} = \frac{ad}{bd} + \frac{bc}{bd} = \frac{ad + bc}{bd}$; $\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$; $\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \times \frac{d}{c} = \frac{ad}{bc}$. For the usual rules for reduction and combination, reference must be made to an elementary treatise on algebra or arithmetic. When the denominator is a power of *ten*, the F. is called a *Decimal F.* (q.v.).

A *continued F.* is one which has in its denominator a F. which again in its denominator has a F., and so on. Such as

$$F=a+\cfrac{1}{b+\cfrac{1}{c+\cfrac{1}{d+\cfrac{1}{e+\&c.}}}}$$

or, more conveniently, $F=a+\frac{1}{b+}\,\frac{1}{c+}\,\frac{1}{d+}\,\frac{1}{e+}\,\&c.$

If the *quotients* a, b, c, &c., are finite in number, then we have a *terminating* continued F., and any ordinary F. may be expressed as such. Conversely, by breaking off at any quotient, the continued F. may be expressed as an ordinary F. If we write

$$a+\frac{1}{b}=B,\ a+\frac{1}{b+}\,\frac{1}{c}=C,\ a+\frac{1}{b+}\,\frac{1}{c+}\,\frac{1}{d}=D,\ \&c.,$$

B, C, D, &c., are termed *convergents* of the continued F., and these convergents are alternately greater and less in value than the F. Further, each convergent is nearer in value to the F. than the one immediately preceding it is, so that they may be said to oscillate from excess to defect with ever-decreasing amplitude. The theory of this branch of pure mathematics has been much studied by Wallis, Euler, Legendre, Sylvester, &c.

A *vanishing F.* is an algebraic F. which for a certain value of the variable takes the form $\frac{0}{0}$, or $\frac{\infty}{\infty}$. For instance, $\frac{x^2-1}{x-1}$ and $\frac{\log. x}{x-1}$ both become $\frac{0}{0}$, when $x=1$. Now this shows that there is a common factor in numerator and denominator which becomes zero for the special case. In the first example this common factor is evidently $x-1$, and the value of the F. becomes $x+1=2$, when $x=1$. The value of the second example may be found by putting $x-1=z$, when the expression becomes

$$\frac{\log.\ (1+z)}{z}=\frac{1}{z}\left(z-\frac{z^2}{2}+\frac{z^3}{3}-\ldots\right)=1 \text{ when } z=0, \text{ that is}$$

when $x=1$.

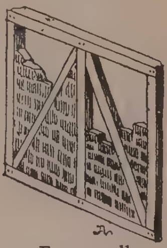
Frac'ture, in mineralogy, is the surface exhibited by a crystal when broken in a direction not coinciding with the planes of cleavage. The terms *conchoidal, even, uneven, hackly, splintery*, are used to distinguish the several kinds of fractures.

Fractures are almost invariably the result of direct or indirect external violence, the former being the more serious lesion, and generally complicated with considerable mischief to the soft parts. When caused by indirect violence, the bone is broken by being snapped between a resisting medium on one side, and the weight of the body on the other. F. are predisposed to by old age, cancerous diseases, scurvy, fragilitas ossium, frosty weather, &c. F. are called *simple* when the bone is broken across; *impacted* when one fragment is wedged into another; *comminuted* when the bone is broken into several fragments; *compound* when the soft parts covering the broken ends of bone are torn through so that the fracture communicates with the surface of the body; *complicated* when conjoined with other circumstances which may be of more importance than the fracture itself, as injury to some important internal organ, the laceration of a principal artery, or a dislocation. In general, F. are easily detected, the most obvious symptoms being increased mobility, displacement conjoined with crepitus, and a peculiar rough feeling caused by the broken extremities grating against each other. A fractured bone is ultimately united by the deposition of new bone around, within, and lastly between the broken fragments, the material for repair being termed *callus*. The callus deposited round the fracture is called *provisional*, as it merely serves as a wrapper and support, and is afterwards in great part reabsorbed, while that deposited between the broken ends is permanently left, and is called *definitive callus*. Treatment:—Wherever the fracture may be, the broken ends of the bone must be brought into as perfect apposition as possible; appropriate appliances must be adapted to prevent the recurrence of displacement; and the constitutional condition of the patient must be properly attended to. Various appliances are in use to prevent the recurrence of displacement. Splints are generally made of wood, pasteboard, gutta percha, or iron; and the bandage with which the limb is enveloped may be converted into a splint by means of starch or dextrine, or a shell may be formed for it by plaster of Paris. A simple fracture is pretty firmly united by the sixth or eighth week, but formerly three or four months elapsed before union of compound fractures took place. When compound fractures are treated by the antiseptic process, introduced by Professor Lister of Edinburgh, union takes place almost as speedily as in the case of simple F.

Fra Diav'olo, a name better known among musical connoisseurs than among students of history, was the *sobriquet* of one Michele Pezza, an Italian adventurer, born in Calabria about 1760, and who successively became a weaver, a soldier, a monk, and a brigand. His cruelty and rapacity were almost equalled by his ingenuity and resource. When pursued, he retired to the Calabrian mountains, amid which he frequently defeated the armed forces sent against him, though these were numerically superior to his own. Ardently loyal, he warmly espoused the cause of the royal house of Naples against the French in the beginning of the century. He was, however, taken prisoner, and executed in November, 1806, for an attempt to raise a rebellion against the invaders. The name has been immortalised in Auber's famous opera, though his hero is a 'Devil' of much milder disposition than the Calabrian brigand.

Frame-Bridge, a name sometimes given to a timber bridge with trussed girders similar to those now used frequently in iron bridges. See BRACES, LATTICE GIRDER, TRUSS.

Frame-Wall, a wall consisting of beams between which brickwork, or plaster, or terra-cotta work is arranged, so that both wood and other material are of the same thickness throughout.



Frame-wall.

Fram'lingham (*i.e.*, 'strangers' town') a pleasant market-town of Suffolk, on the Alde, 14 miles N.N.E. of Ipswich, and 90 N.E. of London by railway. It has extensive remains of an old castle, with thirteen towers, several of which are about 60 feet high, and a gateway carved with heraldic devices. To this the Princess Mary retired when Lady Jane Grey was proclaimed queen. The church of F. is built of flint, has a fine tower 100 feet high with a peal of eight bells, and contains many illustrious tombs and monuments, including those of the Howards, Fitzroys, &c. The Albert Memorial Middle Class College, for boys, was opened in 1865. F. has some trade in corn and other agricultural produce. Pop. reg. sub.-dist. 5837; and civ. par. 2525.

Franc, the current silver coin or monetary unit of France, introduced in 1795 to supersede the *livre tournois*. Its value is about $\frac{1}{25}$ of a pound sterling, or about 9½d. The coin has also been adopted by Belgium and Switzerland. The *leu* in Roumania, the *lira* in Italy, the *peseta* in Spain, and the *drachma* in Greece, are equivalent to the F.

Francavill'a (*Francavilla Fontana*), a town in the province of Lecce, S. Italy, 23 miles W. of Brindisi, is the seat of a college, and has cotton and woollen industries. The public buildings comprise three hospitals and many convents and churches. Pop. 18,826.

France (Lat. *Francia*, Ger. *Frankreich*), one of the largest and most important countries of Europe, extends from 42° 20′ to 51° 5′ N. lat., and from 7° 40′ E. long. to 4° 54′ W. long. It is bounded N. by the English Channel and the Straits of Dover; W. by the Bay of Biscay; S. by the Pyrenees and the Mediterranean Sea. The E. boundary begins in the S. with the Maritime Alps, the line running along the principal ridge from Colla Lunga to Mont Blanc. It then descends to the lake of Geneva, and curving round the canton of Geneva follows the Jura mountains to the pass at Belfort, crossing which it keeps along the ridge of the Vosges. At 48° 15′ it leaves the range and ceasing to depend on natural features, becomes an arbitrary line, passing about 15 miles to the W. of Metz, and holding a north-westerly direction, crosses the Meuse, Sambre, and Scheldt, and reaches the Straits of Dover 8 miles from Dunkirk. The country, which is of hexagonal shape, is extremely compact, its greatest extension from N. to S. being 600 miles, and from E. to W. 550, while in a diagonal direction from Finistère to Mentone it measures nearly 700 miles. The coast, which is flat and marshy in the S. along the Mediterranean, and bold and broken in the N.W., has an extreme length of 1500 miles, including Corsica. Among the promontories are the Gris-Nez, in Pas-de-Calais, the nearest point to England; Cap la Hague and Pointe de Barfleur in the N. of Manche; Pointes St. Matthieu and Raz in Finistère; and in the Mediterranean the Caps Sicie, Camarat, &c. The coast is in part fringed with small islands, of which the chief are Corsica, now forming a department (Corse), Ushant and Belle Isle to the S. of Morbihan, Noirmoutier and Île d'Yeu to the W. of Vendée, Ré and Oléron to the W. of Charente-Inférieure, the isles of Hyères and Lerins off the coast of Var. F. comprises about $\frac{1}{18}$th part of the area of Europe. The population and area of its divisions are as follow, according to the latest returns:—

Departments.	Population.	Area in sq. miles.	Chief Towns.
Ain	356,907	2239	Bourg.
Aisne	545,493	2839	Laon.
Allier	424,382	2822	Moulins.
Alpes, Basses	124,285	2685	Digne.
Alpes, Hautes	115,522	2158	Gap.
Alpes, Maritimes	258,571	1482	Nice.
Ardeche	371,269	2136	Privas.
Ardennes	324,923	2020	Mézières.
Ariège	227,491	1890	Foix.
Aube	255,548	2317	Troyes.
Aude	317,372	2438	Carcassonne.
Aveyron	400,467	3376	Rodez.

Physical Aspect.—The surface of F. is on the whole a somewhat monotonous plain, inclining gently downwards from the Alps and the Pyrenees in a north-westerly direction to the Atlantic. It is rarely marked either by grandeur or variety. The mountain ranges may be divided into (1) an outer girdle, comprising the Pyrenees in the S., and the Vosges, Jura, and Alps in the E.; (2) the range of the Cevennes (q.v.), which stretch from the Pyrenees in a line parallel with the range of Lyon, and then N. along the western side of the Rhône basin, to be continued by the Côte-d'Or and Plateau de Langres in a direction N.E. to the Vosges; (3) the mountains of Auvergne, separating the basins of the Dordogne and Lot in the S. from that of the Loire in the N., and sending off Mont Margeride towards the Cevennes in a south-easterly line, and several low ranges, as the Hauteurs de Gatine, in a direction N.W. and parallel with the Indre and other southern affluents of the Loire; and (4) the mountains of Bretagne, which run in sinuous masses E. and W., and extend into Lower Normandy, sending a spur N.N.E. into the peninsula of Cotentin. The Alps extend for about 280 miles along the frontier, and contain the highest summits in France, as Mont Blanc in Haute Savoie (15,783 feet), though claimed by some to be within Italian territory, Grand Pelvoux (13,440), Mont Genèvre (11,782), and Mont Viso (12,600). Many ramifications trend E. towards the Rhone, forming a wild highland region, in which are the Alps of Valais, Faucigny, Chablais, &c. The Jura range has a sharp rocky contour, and stretches N.N.E. for 450 miles. The Vosges, to the N. of the Jura, gradually lose the Alpine character, and are noted for their vast forests of beech, fir, &c. A considerable depression (Valdieu), known as the Pass of Belfort, divides the Jura mountains from the Vosges, and forms the great eastern gateway to F. Along the N.E. boundary the country rises to the wild, broken plateau of the Ardennes (q.v.). The Pyrenees (q.v.), though inferior in height to the Alps, are wilder and gloomier, consisting of sharp conical groups and ridges, crossed by difficult passes. The Cevennes have a length of 295 miles, and are precipitous mountains, rising in the S.E. in Mont Mezen to a height of 5794 feet, and sinking gradually in the N., where they give place to the Côte-d'Or, on the slopes of which are produced some of the finest wines of France. The mountains of Auvergne are volcanic, and include the Puy de Saucy (6187), Cantal (6093), Mont d'Or (6188), and Puy de Dôme (4806). The chain of the Puys extending N. is a singular series of extinct volcanoes (*chéires*), now clad with verdure, but whose craters and lava-streams are easily distinguishable. To the S. of Auvergne stretches the vast expanse of the *Causses*, calcareous plateaux deeply cut by the Lot, Tarn, Aveyron, and other streams.

Hydrography.—The three great rivers of F. flowing W., the Seine, Loire, and Garonne, have their sources in the Cevennes. The Rhône, entering F. after issuing from the Lake of Geneva, flows S. on joining its great affluent, the Saône. The rivers to the N. of the Faucilles and Plateau de Langres, the Meuse, Moselle, and Scheldt, flow through Rhenish Prussia and Belgium to the Rhine or directly to the North Sea. F. has about 200 navigable streams, which are utilised to the extent of 5500 miles. Smaller rivers with basins of their own are the Somme and Orne, the Vilaine and Charente, and the Adour. Affluents of the Seine are the Aube, Oise, Yonne, and Marne; of the Loire, the Sarthe, Loir, Allier, Maine; of the Garonne, the Dordogne, Lot, and Tarn; of the Rhône, besides the Saône, the Durance, Isère, Ain, and Ardèche. The extensive river system has been supplemented by 100 canals, with a total length of about 3000 miles. The rivers of F. flowing S. are liable to rapid inundations. Among the lakes of F., which are few, the largest are Bourget in Savoie, 12½ miles long and 2½ broad, and Grandlieu in the Vendée. There are numerous lagoons (*étangs*) along the coasts of Gascony, Roussillon, Languedoc, and especially about the mouth of the Rhône.

Climate.—Lying mainly between the annual isotherms 50°-60° F., F. enjoys a singularly fine climate. The climate of the N. generally corresponds to that of the S. of England, but in the S. the winters are much shorter and milder, and the sky is almost invariably clear. Along the Mediterranean the mean temperature is 57°. The regions towards the Alps and the Pyrenees are exposed to wild tempests and piercing winds. In the Rhône valley the temperature is subject to sudden change, owing to the alternations of the hot blast of the sirocco from the S., and the cold impetuous mistral from the N.W. The annual fall of rain on the W. coast is 24 inches, on the S. 23, on the N. 22. The number of rainy days on the W. coast is 152, in the interior 147, on the S. coast 66, at Paris 105.

Geology and Mineralogy.—The geology of F., like that of England, embraces almost all the stratified and non-stratified formations. The greatest area is covered by the Secondary strata, which prevail chiefly in the departments in the E. and N.E., stretching from the Mediterranean to the Moselle. In the W. also they extend from the Garonne to the mouth of the Seine, excluding Bretagne, which is mainly Silurian. The Tertiary series, next in extent to the Secondary, occurs between the Pyrenees and Garonne, and along the E. banks of the Rhône and Saône, and forms the extensive *Paris basin*. The Bretagne hills are chiefly of granitic rocks, and in Cantal and Puy-de-Dôme the rugged angular mountain masses are of volcanic origin. The coal deposits are most abundant in the central departments, in the Cevennes, and along the N.W. coast. French coal is unaccompanied by ironstone. Iron is widely distributed, and about 3,500,000 tons of iron ore are produced yearly. Lead and silver are mined in Finistère, Isère, Puy-de-Dôme, &c.; copper in the N.E., the Rhône, and Basses-Pyrénées. In the E. the salt-mines are of great value. Besides marble and alabaster, there are also among the natural products some argentiferous galena, manganese, antimony, porcelain clay, lithographic stones, slates, &c. There are many mineral springs, of which the most frequented by invalids are in the Pyrenees at Vichy, Mont d'Or, Plombières, and Bourbonne.

Botany and Agriculture.—In the number and variety of its indigenous plants F. surpasses all the other countries of Europe. Ruskin gives a verdict in favour of the trees of F. over those of all other countries for grace of stem and perfection of form in their transparent foliage, and for their beautiful modes of grouping and massing. The forest-trees occupy nearly one-eighth of the entire surface, and include the oak, beech, elm, ash, birch, &c. The largest forests are those of Compiègne, Chantilly, St. Germain, Fontainebleau, Orleans, and the Ardennes. Pines are plentiful in the Pyrenees and Landes, firs in the Jura and Vosges, larches in the Alps, cork-trees only in the basin of the Adour and in Provence. On the mountains of the S. and centre the chestnut abounds, and the walnut is found almost everywhere. The mulberry-tree, cultivated as support for the silk-worm, is chiefly confined to the basin of the Rhône. Of the fruit-trees the principal is the vine, which grows in nearly all except the mountainous parts of F., yielding the best wines in Champagne, Burgundy, Franche-Comté, Dauphiné, Languedoc, and the Bordelais. Among the other fruits are the olive, apple, pear, cherry, plum, orange, citron, fig, pomegranate, lemon, and pistachio.

The country is essentially agricultural, and while the S. is rich in vines and fruits, the N. is equally productive in cereals. As a result of the equal division of land between the children of a proprietor, the area of F. is already held by some 5,550,000 owners, of whom 5,000,000 possess, on an average, not more than 6 acres each. At the present time it is estimated that 92,442,745 acres are under cultivation, and 20,942,728 acres are covered by forests. About $\frac{1}{5}$th of the cultivated area is under wheat, about $\frac{1}{10}$th is under oats, about $\frac{1}{22}$nd under rye, and the same under potatoes. Vineyards cover about $\frac{1}{18}$th, and about $\frac{1}{7}$th is occupied by meadows and permanent pasture. Three great agricultural belts traverse the country from S. to N. Thus the growth of the olive extends to a line stretching from the Corbières to the Alps of Dauphiné, the maize is cultivated to a boundary running from the island of Oléron to the middle of the Vosges, and the vine grows as far N. as the mouth of the Loire and the source of the Oise. Less than formerly of the surface is now covered with the vine, but the French have long borne the character of being the first of wine-makers. The production of wine greatly varies, and among the chief disturbing causes in recent years have been the fungus oïdium and the insect phylloxera. The produce of wine in 1894 was estimated at 859,144,000 gallons (or less than half the production in 1874), and that of cider at 341,902,000 gallons; and although of this quantity the great proportion is consumed in F., the export to Great Britain alone amounted to, in 1894, 3,494,483 gallons of red wine in casks (£698,639); 92,515 gallons of white wine in casks (£19,291); 393,322 gallons of still red wine in bottles (£206,779); 26,624 still white wine in bottles (£13,226); 9436 gallons of sparkling burgundy (£6591); 1,291,261 gallons of champagne (£1,734,269); 129,030 gallons of Saumur (£62,810); 655 gallons of white burgundy (£614); 2640 gallons of moselle (£1245), &c.; total 5,441,900 gallons, valued at £2,744,873. The chief cereal in the W. is wheat, of which a considerable quantity is exported. In the S.W., as well as in the N., there is an extensive cultivation of flax and hemp, while the mulberry is a speciality in the vicinity of Lyon, the great centre of the silk manufacture. Among the other products are barley, oats, rye, buckwheat, hops, beans, peas, potatoes, and beetroot. There is also in the S. considerable production of rice, colza (145,000 acres), tobacco (35,101 acres), chestnuts, walnuts, olives, apples, and plums, madder, saffron, and other dye-stuffs.

Zoology and Live Stock.—The few wild animals yet remaining include the lynx, wolf, boar, chamois, and wild goat. Among the commoner animals are the roebuck, fox, marmot, ermine, hamster, squirrel, polecat, &c. Most kinds of game abound, but the red and fallow deer are scarce. Of birds the songsters resemble those of England; the more formidable birds of prey are the eagle, falcon, and buzzard. The flamingo haunts the Mediterranean shores. Several species of frogs, of vipers, and harmless snakes, and of tortoises are the principal reptiles. Herring, mackerel, sardine, pilchard, turbot, sole, whiting, &c., are caught on the W. coast; tunny and anchovy in the Mediterranean, and salmon in the river estuaries. In the basin of the Arcachon, &c., there are large oyster and mussel beds. *Live stock.*—Of horses there are 2,767,648 as against 3,312,637 in 1866 (highest record); of asses, 357,965 as against 518,837 in 1866 (highest record); of horned cattle, 12,154,641 as against 13,661,533 in 1891 (highest record since 1862); of sheep, 20,275,716 as against 30,386,233 in 1866 (highest record); of goats, 1,466,451 as against 1,794,837 in 1873 (highest record); and of swine, 5,860,592 as against 6,337,100 in 1892 (highest record). The finest horses are reared in Normandy, while the Jura, the Vosges, and the basin of the Rhône are equally noted for their breeds of cattle. The yearly production of eggs is valued at £4,000,000, and eggs to the value of £1,182,800 are exported. There are £760,000 worth of honey and wax produced yearly in F. from 3,000,000 hives; the best honey is from Aude. Ardèche, Vaucluse, Drôme, and Gard are the great seats of the silk-culture, and previous to 1853, when disease broke out among the silkworms, the yield of cocoons amounted to 25,000 tons.

Industries.—F. has many and important industries, and of these perhaps the principal is the production of silks and velvets. Besides the raw silk produced at home, which amounts to over 20,0000,000 lbs., the amount yearly imported is over £10,000,000 worth. The weaving is done chiefly at Lyon, and in the department of Rhône, at St. Étienne and St. Chamond (ribbons and brocades), at Nîmes (light stuffs), and at Tours (silk furnishings). Silk lace is made at Alençon, Bayeux, Lille, Arras, &c. The northern towns (Rouen, St. Quentin, Amiens, &c.) are most important seats of the cotton and woollen manufactures, while the linen industry is chiefly confined to Lille, Cambrai, &c. Since 1870 the making of printed calicoes has been much limited to Paris and Rouen. Paris is noted for the variety and extent of its manufactures, including machinery, chemicals, porcelain, mirrors, clocks, watches, gloves, hosiery, *modes*, and above all jewellery. Another watchmaking centre is Besançon, where are mounted the pieces made in the Jura mountains. Over half a million tons of beet-sugar are produced (at Paris, Lille, Douai, &c.) from roots grown in F. Raw sugar from abroad is refined at Marseille, Bordeaux, Havre, and Nantes. St. Étienne has great manufactures of firearms and hardware; Sèvres, of porcelain and glass wares; Reims, of merinoes; Gobelins, of tapestry and cashmeres. Perfumery is extensively made in Paris and also in Provence.

Commerce.—In regard to commerce F. ranks next to Britain among the countries of Europe. Its foreign trade nearly trebled in value from 1860 to 1883, rising from £167,000,000 to £417,936,000. In 1893 the value of the imports was estimated at £197,000,000, and that of the exports at £172,000,000. The five chief articles of import were raw silk, corn and breadstuffs, wool, raw cotton, and coal. In 1893 the export of horses numbered about 25,000; the value of spirits exported was over £2,000,000; of fruit £1,400,000; of haberdashery, fancy wares and toys, £5,000,000; of hides, £3,000,000; of silks, £14,000,000; of sugar, £4,500,000; and of wool about £4,500,000. The foreign commerce is mainly with Great Britain, Belgium, Germany, Spain, United States of America, and Italy, Great Britain ranking far above any other country. The mercantile navy, exclusive of 'bateaux de la pêche côtière,' number 15,376 vessels of 895,423 tons, including 1186 steamers of 498,841 tons. The chief ports are Bordeaux, Marseille, Havre, Nantes, Brest, Calais, Dunkirk, and Boulogne.

Railways, &c.—The growth of the modern railway system in F. dates from about 1840. The various railways, which are all subsidised by the state, are entirely in the hands of six great companies, viz., the Paris, Lyon, and Mediterranean, the Paris-Orleans, the Northern, the Southern, the Western, and the Eastern, having a total length of 22,561 miles. There are 59,693 miles of telegraph lines.

Finance.—The accounts of actual revenue and expenditure are seldom published by the Government of F. till the lapse of some years. The estimated public revenue in 1895 was (including Algeria) £136,976,305, and the estimated expenditure (including Algeria) was £136,955,750, thereby showing a slight surplus, which will be entirely consumed by the cost of the Madagascar expedition, in fact we must expect a large deficit. The sources of the revenue are the direct and indirect taxes arising from stamps, imposts, customs, *droits d'octroi*, produce of forests and telegraphs, &c. The enormous increase of expenditure of recent years has been met by the imposition of new indirect taxes on sugar, wines, salt, transport by railways, &c. In 1793 all the Government debts, annuities, &c., were consolidated in a perpetual five per cent. *rente*, entailing an annual charge of 174 millions of francs. At first the dividends were only paid in *assignats* or paper of fictitious value, but six years later the Government was forced to compound with its creditors, which it did out of the confiscated property of the Church and the nobles. Thus at the beginning of the 19th c. the annual charge of the national debt was reduced to £1,600,000, or less than one-tenth of that of Britain. By the date of the restoration (1814) the interest of the debt had only increased to 63 millions of francs, but under Louis Philippe (1830-48) the indemnity to the *émigrés* and other heavy war-debts raised it to 244 millions. During the Empire this sum was gradually augmented, and in 1870 it amounted to 358 millions, representing a capital of 11,500 millions of francs or £460,000,000. Having been more than doubled by the war of 1870-71, and by the indemnity to Germany of five milliards of francs, it amounted on 1st January, 1875, to a nominal capital of £937,584,280, bearing an interest of £29,936,196. The public debt has been now estimated at £1,224,467,405, costing the country in interest and annuities at the rate of £1 6s. per head of population.

Army.—The army has been reorganized on the basis of a law of 1872, which enacts universal liability to arms, and disallows substitution or exemption for money. The law of 1872 has been expanded and modified by further regulations of 1873, 1875, 1882, 1887, 1889, and 1892. All Frenchmen between the ages of twenty and forty-five, not legally exempted, must serve for three years in the active army, for ten in its reserve, for six in the territorial army, and for six in its reserve. Among the exempted are those physically unfit, the pupils of the École Polytechnique and the École Forestière, teachers in public schools, professors, ecclesiastics, and artists who have gained the Grand Prix of the Institute. Soldiers of the active army who have learnt their duties, and can read and write, may at the end of a year procure a furlough for an indefinite time. As to the effective force of the French army, see ARMIES, MODERN. The expenditure for the army in 1869 was £15,359,192, in 1880 £22,811,203, and in 1895 (estimated) £25,923,428. The whole of F. is divided into eighteen military regions, each containing a mobilised *corps d'armée*. Included in the effective force are 145 divisional regiments, and 18 regional regiments of the line, 30 battalions of *chasseurs-à-pied*, 5 battalions of African Light Infantry, 77 regiments of cavalry, 38 regiments of Field Artillery (besides fortress artillery, &c.), 4 regiments of engineers, in addition to military train, 4 regiments of Zouaves, 4 of Algerian *tirailleurs*, 6 regiments of *chasseurs d'Afrique*, 4 of Spahis, and 2 regiments of *étrangers*. Since the German annexation of Metz and Strasbourg the fortified *chefs-lieux* or headquarters have been Arras, Avignon, Bayonne, Besançon, Brest, Cherbourg, Grenoble, La Rochelle, Havre, Lille, Marseille, Montpellier, Nantes, Perpignan, Quiberon, Rouen, St. Omer, Toulon, and Toulouse. Paris and Lyon are separate military centres.

Navy.—At the end of 1894 the navy (including vessels being built or projected) was composed of 33 battleships, 18 Port Defence ships, 155 cruisers, and 230 torpedo vessels, in addition to a large number of unarmoured cruisers and troopships, with 2084 officers and 41,536 men. There are in active service 2 admirals 16 vice-admirals, 30 rear-admirals, 115 captains of first-class men-of-war, 217 captains of frigates, &c. The navy is manned partly by conscription, and there are constantly on the rolls some 114,000 names, (See also NAVIES, MODERN.) The great Government docks are at Toulon, Brest, and Cherbourg.

Constitution and Government.—The present constitutions voted by the National Assembly of 1871, bearing date of 25th February and 16th June, 1875, and subjected to modifications in 1884, 1885, and 1889, vests the legislative power in an assembly of two Houses, a Chamber of Deputies, and a Senate of 300 members, and the executive in a chief magistrate, called President of the Republic, and his ministry. The Chamber of Deputies is elected by universal suffrage under the uni-nominal vote. By this law every arrondissement elects one deputy for four years, and if its population exceeds 100,000, an additional deputy for each 100,000, or portion thereof. Deputy and voter must each have the qualification of citizenship, while the former must be twenty-five and the latter twenty-one years of age. There are now 584 deputies. Of the 300 senators, who are elected for life or for nine years (one-third of these retiring every three years), 225 are elected for nine years by the departments and by the colonies, while 75 are nominated for life by the Senate and the Chamber of Deputies united. The only necessary qualifications of a senator are that he be a Frenchman and forty years of age. The two houses of legislature must remain in session for at least five months in the year. The President is bound to convoke an extraordinary meeting if it is demanded by one-half of the members of each chamber; he can also adjourn the Chambers, but the adjournment may not exceed the term of a month, nor occur in one session more than twice. The President, who is nominated for seven years, and is eligible for re-election, is elected by a majority of votes by the two Houses united in National Assembly. He has the control of the army, promulgates the laws when they are voted, and appoints to all civil and military posts. But every act of the President must be countersigned by a minister; and the ministers, of whom there are nine, are responsible to the Chambers for the general policy of the Government. The President is only responsible in case of high treason. His salary is fixed at £24,000, with an extra allowance of £24,000 for household expenses. Each Senator and Deputy receives £360 per annum, and the President of each Chamber receives an additional £2840.

Administration of Justice.—A special Minister of State presides over the administration of justice. There are *tribunaux de première instance* for the arrondissements, police courts, tribunals of commerce, and courts of appeal. A *cour de cassation*, of three chambers, pronounces on all the sentences of the police and assize courts; and a *haute cour de justice* gives final judgment on state offences. There are 380 department prisons, besides central prisons, political prisons, the *dépôt de forçats* of St. Martin-de-Ré, agricultural penitentiaries in Corsica, and the penal settlements of Guinea and New Caledonia.

Education, &c.—Public education of France and Algeria is now entirely under the direction of the Government. In 1886 it was decided that the male teachers at the public schools should be laymen, and though the Roman Catholic *Facultés* had been suppressed in 1885, their universities were permitted to be carried on under certain conditions. There are at present some 4400 teachers and 9500 pupils at the ecclesiastical seminaries.

The public institutions consist of universities, secondary and elementary schools.—*Universities.* There are *facultés des lettres* and *facultés des sciences* at Besançon, Bordeaux, Caen, Chambery (combined), Clermont, Dijon, Grenoble, Lyon, Montpellier, Nancy, Paris, Poitiers, Rennes, and Toulouse. At Aix there is only a *faculté des lettres*, and at Marseille only a *faculté des sciences*. Besides these there are six *facultés* of medicine, six of law, and two of Protestant theology.—*Secondary Schools.* There are 105 Lycées, 238 Communal Colleges, and 50 schools for girls.—*Elementary Schools.* There are 69,865 primary and 2603 infant schools, besides over 20,000 private schools, of which 11,830 are denominated clerical schools. There are about 95,000 children attending the secondary schools, and about 6¼ millions being educated at the primary schools. The school age is from six to thirteen. In the budget estimates for 1895-96 public education cost the country about £7,700,000, which is considerably below the estimated charge in the United Kingdom in the same year.

There are in addition to these public and private schools many industrial and technical schools, and also military and naval schools.

Among the great literary and scientific institutions are the Institut de F. (q.v.), the Conservatoire de Musique, the École des Beaux-Arts, the Bibliothèque Nationale, &c. There are rich art and scientific collections, and many charitable institutions receiving yearly from the state as much as nine millions of francs.

Religion.—The population consists of 38,343,192 (according to the latest returns) of all denominations, about 2 per cent. of whom are Protestants (Reformed and Lutheran), and ⅛th per cent. Jews. All religions are allowed by law, but only the Roman Catholic, Protestant, and Jewish Churches receive state allowances, which are paid only to those sects that number over 100,000 members. In this way the Roman Catholics obtain £1,688,260, the Protestants £61,916, and the Jews £6450. In the Roman Catholic Church there are 86 prelates, 17 archbishops, and 67 bishops, 192 vicars-general, 723 canons, 3531 *curés* or incumbents, and 31,569 *desservantes* or curates. The Lutheran Protestants are governed by a general consistory, while the Reformed Protestants or Calvinists are under a council of administration, the seat of which is at Paris.

Colonies.—The foreign possessions of F., both colonies and protected countries, cover an aggregate of 2,484,783 sq. miles, with a population of 43,750,000. They are situated in Asia, Africa, America, and Oceania. The most important colonies are, in Asia—Cochin China, Tonquin, and Anam; in Africa—Algeria, Congo, Senegal, Guinea Coast, and Obock; in America—Guiana, Martinique, and Guadeloupe; and in Oceania, New Caledonia. The chief protected countries are Cambodia, Madagascar, and Tunis. See separate articles.

History.—The earliest historic inhabitants of F. were Celts, known as Gauls, who held all modern F. except the S.W., and who, a considerable time after they had settled in the land, were driven into the E. and S.E. by the Belgæ, a Celtic people with probably an infusion of Teutonic blood. The S.W. of the country belonged to the Aquitanians or Basques, a shorter and darker people akin to the Iberians, and probably a survival from pre-Aryan times. The Gauls and Belgæ were blue-eyed and yellow-haired, eminently brave and intelligent, the Belgæ being more thoughtful and patient than the Gauls, who were above all mobile and keen-witted, full of unstable heroism, and delighting in brilliant colours and barbaric display. Both peoples were ruled by Druids and chiefs, and were divided into clans. Long before Cæsar's invasion the strength of the Gauls had been sapped by the pleasures and splendours of Rome, which interfered in their tribal quarrels, and before 118 B.C. formed the Rhône valley from Geneva to the sea into a Roman province (*Provincia Romano*, hence Provence). Rome won no fresh land in Gaul until Cæsar's proconsulship, B.C. 58-51. In campaign after campaign he routed the Gauls, until the capture of Alesia laid the whole country at his feet (B.C. 51). From 50 B.C. to A.D. 476 Gaul was a province of the Roman state, and her inhabitants received that Roman impress to which France owes her language, her law, her religion, and even several features in the character of her people. From Rome the Gauls acquired the love for centralised city life, for severe logical theories of government, and for the conceptions of the equality of man and of universal empire which have played so large a part in the nation's career. Southern F. especially was so deeply Latinised as to become a different land from F. north of the Loire, and to retain, during the Middle Ages, part of the law and a faint reflex of the civic life of Rome. Before the 3rd c. Gaul was studded with fair cities, centres of commerce and luxury, whose governments, modelled on the Roman *municipia*, were the germ of the French southern *communes*. But along with the civilisation came the corruption of the dying empire, and Christianity, introduced in its Greek form in 160 by Pothinus, made little progress until Roman missionaries entered the country in the 3rd c. In 251, however, Dionysius founded the church of Paris, and the conversion of the Gauls quickly followed. In the first half of the 5th c. the barbarians, who were breaking up the empire, poured into Gaul, the Burgundians seizing the region between the Rhône and Jura, the Visigoths occupying the S.W., and the Franks making raids through the N. and establishing a fluctuating power along the lower Rhine. These tribes did not seize Gaul by a united invasion, but broke up the unity of the country by intermittent incursions, and by settling in separate bodies through the land. Commerce and agriculture were thus arrested, the national life was palsied, and the towns were cut off from each other and gradually enfeebled. Guizot traces French civilisation to three sources—ancient Rome, the Germanic invasions, and the early Church. Rome, he says, gave F. the ideas of law and order; the Teutons brought the sentiment of individual independence and passionate love of freedom, while Christianity cleansed the land from the impurities of an effete paganism. The Teutons strove in their new settlements to conform to Roman institutions and ideas, while the cities of Southern F. preserved the relics of the Roman municipal government. The Franks consisted of two main branches, the Ripuarians, who dwelt near Köln, and the Salians, who held the districts at the mouths of the Rhine. They were ruled by princes called Merwings, one of whom, Hlodowig (Clovis), in 486 overthrew Syagrius, who governed in the Roman name at Soissons, then embraced the orthodox faith, crushed the Arian Burgundians and Visigoths, and before his death, in 511, established a Frankish monarchy embracing most of modern F. On the death of his son Hlotair (Clotaire), in 567, three clearly-defined kingdoms began to arise—that of N. Gaul or Neustria ('the W. kingdom'), between the Loire and Meuse; that of Austrasia ('the E. kingdom'), between the Maas (Meuse) and the Rhine; and that of Burgundy, including the Rhône valley and part of Switzerland. The Franks were comparatively numerous in the N., where Orleans, Paris, Soissons, and Metz became capitals of Frankish kingdoms, but they had few, if any, settlements in Aquitaine and Burgundy. Under Dagobert, king of Neustria, the power of the Merwings was at its highest, but on his death (638) the Merwing kingdom faded away, and after the battle of Testry (687), in which the Austrasians under Pippin of Heristal defeated the Neustrians, Pippin and his descendants ruled over Austrasia and Neustria as Mayors of the Palace, the *rois fainéants*, or Merwing kings, being allowed to retain the name of royalty until 752, when Pippin the Short, son of Karl the Hammer—the Mayor who drove back the Saracens in the fight of Tours (732)—was proclaimed king of the Franks. The reigns of the Karolings, the empire of Karl the Great, belong to the history of Germany. Under Karl the Great Gaul was simply a province of a great German empire, as it had formerly been of the empire of Rome. The Merwing monarchy was in a degree French, Neustria being mainly peopled by Gallo-Romans, but Austrasia was a purely German land, the Karolings were German in blood, speech, and customs, and their favourite abodes were Aachen (Aix-la-Chapelle) and Engelheim in the Rhine valley. The Merwing monarchy arose from the warrior kingship of the Franks, the Merwings being encircled with peculiar reverence, as the descendants of heroes and demigods; while the Karolings dazzled their subjects by claiming to wield the universal dominion of imperial Rome. From neither of these monarchies is modern F. descended. Modern F. dates from the rise of the Parisian monarchy of the Capets, which gradually absorbed most of the old province of Gaul. The treaty of Verdun (843) severed Neustria, now a distinctly Romance land, from Teutonic Austrasia; and, down to the 14th c., the kingdom of Paris, which grew into modern F., possessed neither Burgundy, Provence, Elsass, nor Lothringen, nor had it for 600 years any firm authority over Aquitaine. Celtic or Romance F., as distinguished from Teutonic F., first appears at the treaty of Verdun in 843; Parisian F. first appears in 888, when Karl the Fat, for a time ruler of Germany, Italy, and Neustria, was deposed, and the Karoling empire split into the W. kingdom or F., and the E. kingdom or Germany, Italy, and Burgundy. From the death of Karl the Great Paris had been steadily rising in power, and her noble defence against the Northmen in 885 decided her future as capital of F. north of the Loire. She was not, however, at once made the capital of an existing French kingdom, but, on the contrary, from being the chief place of the county of Paris, grew into the kingdom of F., a kingdom distinct alike from the Roman province of Gaul and the W. kingdom of the Karolings. In 888 the nobles of the N. of F. chose Odo, the chief defender of Paris against the Northmen, as king, but he had to declare himself a vassal of the king of the E. Franks, and a century of constant rivalry ensued between the Karolings, who held their court at Laon, near the German border, and the house of Capet, which ruled at Paris—between the slightly-Germanised Romance kingdom of the W. and the Teutonic kingdom of the E. About the close of the 9th c. the Northmen made permanent settlements in N. F., and at length in 911 Hrolf (Rollo) received the lordship of the region between the Epte and Brittany, where he founded the great dukedom of Normandy. The Karolings growing more incompetent as the 10th c. advanced, in 987 Hugues (Hugh) Capet abolished the monarchy of Laon, thus breaking the ties between F. and Germany, the native land of the Franks. The subsequent history of F. until the end of the 18th c. is mainly concerned with the slow fusion of various provinces into the monarchy of Paris, and the gradual change of the kingly office from a weak overlordship into a despotism. Hugues Capet was merely one of the great peers of F., having only a faint superiority, except in his own domain, a tract of land hemmed in by Normandy, Brittany, Burgundy, and Aquitaine. The Capetian was distinguished from the Karoling monarchy by making no claim to represent the Roman empire, and by its more essentially feudal nature. The fall of the Karolings had doubtless been hastened by the suspicions which the great barons, whose lands had been at first benefices granted in return for services at court, entertained towards the dynasty whose privileges they had usurped, and which had the right to reclaim the estates. A monarchy with less lofty pretensions was wished for, and was found in the purely feudal monarchy of the Capets. The new kings were more closely allied with the Church than were the earlier dynasties. A vague holiness began to be associated with the kingly office, and it is probably to ecclesiastical influence that we should ascribe the mildness and even feebleness of the early Capets, under whom the land was torn by feudal war, the nobles defying the kings, who could scarcely maintain the slight overlordship held by the first of their line. The Capetian kingdom was little more than a name until Louis VI. (1105-1137), with the aid of the Church, and by making common cause with the people, humbled the great feudatories of the crown. The king began to be looked on as the centre of justice, as the holder of a vague power which was dimly seen to be something apart from feudal overlordship, to represent the people and protect them from feudal oppression. Much of Louis VI.'s work was undone in the reign of his feeble son Louis VII., whose supremacy the nobles shook off, and who was overshadowed by Henry II. of England. That king made war in F., not as an English sovereign, but as a great French feudatory, and held more land in F. than belonged to all the other French nobles together, while his feudal superior, the king of F., was a comparatively unimportant ruler cooped up in a small central district. But the mysterious popular respect still clung to the kingly office, and Louis VII.'s successor, Philippe August (1180-1223) changed an unstable superiority coloured by an indefinite moral influence into a vigorous though still a feudal monarchy. He added Normandy to his realm by the capture of Château Gaillard (1204), and in the victory of Bouvines (1214), where he crushed the feudal barons allied with Otho of Germany, secured the future of royalty in F. He was greatly aided in his struggle with feudalism by the *communes*, which he favoured, and by the lawyers, who were becoming important through the reviving interest in Roman law. During his reign the brilliant civilisation of Southern F. was almost extinguished in the crusade against the Albigenses. Up to this time the S. had held aloof from the N., the Loire flowing between two lands widely different in the customs and even the race of their inhabitants. The Frenchmen of the N. were a mixed people of Celts, Franks, and Norsemen; the Aquitanians were partly Basques, partly Visigoths; and the Provençals had a considerable infusion of Roman blood. The S. had preserved a fragmentary code of Roman law in preference to the northern feudal *custom-right*, and contained many rich free cities, full of refined and democratic citizens, with governments based on the Roman *municipia*. Hlodowig's invasions of the S. had kindled a bitter hatred among the southern Gallo-Romans and Visigoths for the N., the land of the Franks—a feeling which remained throughout the Middle Ages, the early dislike of Aquitaine and Provence for the Merwings and Karolings being transferred to the monarchy of Paris. While the N. was torn by feudal strife, in the S., where the power of the Church was almost extinct, poetry, art, and philosophical speculation were assiduously cultivated. Southern F., imbued with Arabic science and cherishing Roman municipal rights, was bringing on a sceptical, democratic movement, intensely hostile to feudalism and the Catholic Church. Therefore the Pope stirred up a crusade against the Albigenses (q.v.), or heretics of Languedoc, and from 1207 to 1215 the barons of the N. slew and ravaged in the S. country, which never recovered its old wealth, luxury, and culture, though it still is, in the speech, customs, and blood of its people, aloof from F. north of the Loire. Louis IX. (1226-44) added to the royal domains by treaties and purchases, and while scrupulously recognising certain feudal rights, determinedly strove to root out the feudal privileges of private war and judicial duels. He has been called the founder of the French absolute monarchy, and his virtues gave the kingly office a popularity which in a large measure enabled it to grow into the foul despotism of the 17th and 18th centuries. In his reign occurred the last of the crusades, expeditions which had indirectly strengthened the French monarchy. At first the royal power gained by the crusades carrying off hosts of turbulent barons to the East, many of whom never returned to F., while the kings prudently stayed at home; and, afterwards, when the kings became leaders of armies to Palestine, their influence was increased by the lofty position they thus held before all Europe. The cities also throve from the crusades, which quickened their trade, and enabled them to buy privileges from barons who needed money to travel to the Holy Land, while, as each man who became a crusader was thereby freed, a vast number of serfs thus won their liberty, and both the cities and the new freemen were warm supporters of the crown. Under Philippe le Bel (1285-1314) the old feudal monarchy began to change into a despotism. In his reign we see clearly the baneful tendency to concentrate all power in the king, which ended in a systematic depressing of national life, in a general political ignorance, that bore fearful fruits in the days of the Revolution. While in England the free Teutonic institutions always survived in theory, F. in the time of Philippe le Bel had lost all the old Frankish popular rights. Hence reform in F. has always required changes wrought by abstract theory, the country having been, unlike England, deprived of foundations on which to build. Under Philippe le Bel all laws and administration emanated from the crown, the nobles were only consulted when war was intended. The lawyers at this time did good service in lessening feudal and ecclesiastical influence, but lent themselves to foster despotism. Being raised to offices at the will of the king they became his instruments in special commissions, and the monarchy thus won vast judicial power. After Philippe's death the monarchy was severely shaken throughout the 14th c., being assailed both as to the nature of the succession and as to the nature of its power. During the reigns of the three sons of Philippe le Bel (1314-28), peasant rebellions, famine, and disease desolated F., and on the death of Charles IV., last son of Philippe le Bel, the succession to the throne was disputed between Philippe Comte de Valois, cousin of the last king, and Edward III. of England, who claimed the crown as the son of Isabella, Philippe le Bel's daughter. The nobles, along with the 'notables of Paris and the other good towns,' decided in favour of Philippe, who then provoked Edward to war with the hope of annexing Aquitaine, the last remnant of the Continental kingdom of Henry II. of England. In 1337 began the struggle known as the *Hundred Years' War*. Under Edward III. the English won the victories of Crécy (1346) and Poitiers (1356), and took Calais during the first period of the war, which ended at the peace of Bretigny (1360), Edward giving up his claim to the French crown, and being declared the independent ruler of Aquitaine, Calais, and several small districts. At this time the condition of F. was unspeakably wretched, agriculture and commerce were at a standstill, and in 1348 the land was ravaged by the Black Plague. At length the peasantry rose (1358), and slew and plundered until the nobles ruthlessly quelled the revolt. From the common nickname of the peasants—*Jacques Bonhomme*—the name *Jacquerie* was given to this and all succeeding rebellions of like nature. Now, too, the Parisians strove to establish a free commune, under Étienne Marcel the provost, and assumed for the first time a revolutionary cap of red and blue. This effort, like the Jacquerie, was suppressed by the barons. In the reign of Charles V. (1364-80) the French gradually drove back the English, who before Edward III.'s death lost nearly all Aquitaine except Bordeaux and Bayonne. From the death of Edward III. to the invasion of Henry V. there were occasional truces, but no definite peace. During the reign of Charles VI., F. was rent by party strife, and Henry V. of England entered the country, won the battle of Agincourt in 1415, and by the treaty of Troyes (1420) was acknowledged successor to Charles VI. on the French throne. Charles VI. and Henry died in 1422, and war continued between the English regent, the Duke of Bedford, and Charles VII., who, mainly through the patriotic ardour of Jeanne d'Arc, was crowned at Reims in 1429. After Bedford's death the English steadily lost ground, until in 1453 Bordeaux and Bayonne fell, and Calais alone remained of their Continental possessions. Thus ended the Hundred Years' War, which left F. in the darkest misery. The country was desolate; in many provinces there was scarcely a house outside of the walled towns; the roads were overgrown by thickets; the peasantry had fled to the cities, where many of them were sunk into beggary. But the strength of the lesser nobles was broken by the war, and the towns were thus enabled to wring new liberties from them. An upper class of traders arose, and the *bourgeoisie* carried their influence to the side of the crown. Louis XI. (1461-83) favoured the third estate, and jealously humbled the nobles. The 'third estate,' or the people, which now becomes somewhat important, sprang from the Roman municipal towns, which survived through the Middle Ages; from the *communes*, which won their independence by warring with the barons; and from the gatherings round a noble's dwelling of peasants and others, who, as they grew in numbers and practised trades, were enabled to win privileges from their overlord. The royal officers and lawyers, being mostly of low birth, were also a powerful element in the third estate, which rose in influence throughout the 15th c., though the communal liberties were now disappearing. In 1494 Charles VIII. marched into Italy, and, though his conquest of the country was ephemeral, the results of his invasion were momentous, as they committed F. to a ruinous policy, and led to disastrous wars with Spain. The next French king, Louis XII., was likewise inflamed by the hope of Italian conquest, but wasted his strength in intrigues of which Austria reaped the benefit. François I., the successor of Louis, plunged into war with the Emperor Karl V., and was captured at Pavia, the struggle between F. and Spain going on until 1558, when the Spaniards having won the victories of St. Quentin and Gravelines the peace of Cateau Cambresis was concluded. These wars cost F. a lavish waste of blood and treasure, and infected her with the luxury and seductive vices of the South, but they also brought the impressible French into contact with a refined people, imbued with the spirit of the Renaissance, which was now diffused by the French through other nations. From 1562 to 1595 French history is mainly occupied with the civil wars between the Catholics and Protestants. The latter, who were Calvinists, were known as Huguenots. During the reigns of Henri III.'s three sons, François II. (1559-61), Charles IX. (1560-74), and Henri III. (1574-89), great authority rested with their mother Catharine de' Medici, a bigoted Catholic, who foully abused her power in persecuting the Huguenots. In 1572 the massacre of the Protestants known as the Massacre of St. Bartholomew was perpetrated at Paris, and the struggle continued with shifting fortune until 1589, when Henri III. died. Henri of Navarre, a descendant of Louis IX., was now the rightful heir to the throne, but Paris and most of F. would not obey him, until in 1593 he became a Catholic and was made sole ruler, changing the old title *King of the French* for the new title *King of F. and Navarre.* Henri IV. passed the Edict of Nantes (q.v.) in 1598, and, supported by Sully, reformed many financial abuses, chastised the nobles, and protected the people. His popularity and Sully's ability rendered it unnecessary to summon the States-General to confer supplies, and the centralization of power was thus largely confirmed. On Henri's murder in 1610 the government was administered by the Queen until 1614, when Louis XIII. nominally began to reign. At this time the ecclesiastical power somewhat declined in F., the king confirming the Edict of Nantes and other measures in favour of the Protestants, and the Catholic statesmen abandoning their former intolerant policy. Richelieu, the minister who really governed France during the last eighteen years of Louis XIII.'s reign, broke away from the old religious alliances, checked ecclesiastical influence in the state, and enforced the principle that national interests and not religious differences must determine political relations. The kingly power was further strengthened by Richelieu's antagonism to the nobles. He cut down their privileges and political importance, though he could not lessen their social power, which retained its malign influence until the Revolution. Under his indulgent policy the Huguenot party lost its importance and many of its members passed over to Catholicism. The Calvinist clergy, however, stirred up a somewhat factious resistance to Richelieu, and a war broke out, which was ended in 1628 by the capture of Rochelle, the great stronghold of French Protestantism. On the death of Louis XIII. (1648), F. was ruled by Mazarin, whom the queen-mother had made prime minister. Mazarin's unpopularity and the exactions under which the people groaned led to the rebellion of the Fronde (q.v.), in which the nobles, the *bourgeoisie*, and the mob of Paris rose together against Anne of Austria's regency. Even princes of the blood shared in the insurrection, and the Parisian populace, inflamed by over-taxation, was led by one of the ablest of demagogues, the Cardinal de Retz. But the movement only proved the inherent strength of the monarchy. There was no sympathy between the aristocrats who headed the struggle and the people. The nobles were blind to popular interests and large political issues, while the people were too ignorant to produce leaders from their own ranks. Another century was needed to imbue the populace with clear political convictions, with revolutionary ideas as well as revolutionary fervour. In the 17th c. there was nothing to take the place of the monarchy in governing F., and after the Fronde collapsed the royal power shot up into unexampled splendour under Louis XIV. He came to the throne in 1661, and his reign is the culminating epoch of the French monarchy. Before Louis XIV. the kingly power was checked by other influences, and after Louis XIV. it passed into a rapid decay. Up to this reign there was a possibility of the crown and people uniting to remove abuses. But under Louis XIV. all political activity on the part of the nation was frozen, all co-operation ceased between the ruler and the people, on the latter of whom it was now impressed that the king must initiate and carry out everything. The country laboured under evils so vast as to render the warmest co-operation between the crown and its subjects indispensable for their correction; and when the reform could no longer be delayed, the monarchy, isolated from the people by its systematic repression of national spontaneity, was unable to cope with the task of reform. Louis's reign began with success, but closed in gloom. At the end of the Thirty Years' War F. was the chief power in Europe, and under Louis XIV. stepped into the place from which Spain had fallen. Louis's policy of aggrandisement was at first successful, but in the Spanish war of succession his ambitions were shivered. His armies were defeated, the revocation of the Edict of Nantes (1685) deprived F. of a large industrious population, the revenue was scandalously misapplied, and on Louis's death in 1715 the national debt amounted to £140,000,000 sterling. Under Louis XV. costly wars were carried on with England, Spain, and Austria, and by the treaty of Paris (1763) the larger part of the French colonial possessions was given up. So gross was the misgovernment that F. was brought to a state of seemingly incurable bankruptcy and misery. The country was dying under the weight of the monarchy, when, in the days of Louis XV.'s successor, Louis XVI., the changes began which led to the French Revolution. The monarchy had engrossed all power, feudal, legal, and clerical ideas having combined to swell its authority. The feudal theory of monarchy made F. the king's private estate; the lawyer's theory, based on Roman ideas, made him the sole representative of the nation; and the clerical theory made him the delegate of God. And the government, while narrowly concentrated and inquisitorially administered, was rude and ineffective, the king failing to perform the functions which his office had engrossed. The country was overrun by tax-collectors—about 250,000 in number—who veiled their extortions behind the royal name. The nobles, suspected by the king and hated by the people, remained in defenceless isolation, debarred from all share in the government, while they still kept their galling rights and immunities, and spent their lives in the costliest pleasures. Louis XV. made Versailles the scene of habitual revels, recalling the foul orgies of imperial Rome, and consumed one-fourth of the public revenue in keeping up his household. As the 18th c. advanced, the state of the people grew more and more wretched. They were the only class engaged in productive labour, their exertions were hampered by absurd restraints, and upon them rested the sole burden of supplying the public revenues, the nobles being free from taxation except a merely nominal class-duty. In 1715 a third of the poor classes perished from want; in 1725 St. Simon said the king was making F. a hospital of dying men and women; and in the middle of the 18th c. the majority of the rural population could not with the utmost efforts earn enough bread to keep themselves alive, and at the same time pay the subsidies. Wide tracts of land were deserted; the peasants, unable to maintain life in the country, became beggars in the towns; 'starvation,' says M. Taine, 'was an endemic disease.' The ancient régime by its monstrous waste of the public resources, its *lettres de cachet*, its secret system of police, its endless confiscation of individual possessions, its forced services, its grinding taxation, its inquisitorial interference with private rights, had broken F. into bitterly hostile sects, and was actually maintaining an anarchy worse than that of the worst days of the Revolution. Meanwhile the intellectual class was wholly at variance with the existing institutions. The literary men—who had been systematically persecuted by the monarchy, and debarred from all share in public life, while they had no practical knowledge of government, but were inspired by the old Gallic passion for equality, by an ardent belief in the perfectibility of man, and an intense hatred of existing social bonds, sentiments learned from Rousseau—were convinced that they could break with the nation's past, and mould society anew independent of its historic growth. As they were not mere speculative students, but lucid, fiery popular writers, they speedily imbued the people with their convictions; and to their wide influence, ignorance of practical politics, and passion for framing a government by theoretic doctrine, are due many of the wildest, emptiest follies of the Revolution. In 1789 Louis was forced by deficits to convoke the States-General, which had not met since 1614. On 17th June the third estate declared itself the National Assembly, and on 23rd June proclaimed its members inviolable. The king then dissolved the ministry, and gathered a body of troops round Versailles, the result being that on 12th July insurrection flamed wildly out in Paris, and on the 14th the Bastile was taken by the mob. On 4th August the National Assembly—commonly known as the Constituent Assembly—abolished feudal rights; on 6th October the Parisian populace, their rage sharpened by accounts of the Versailles banquets, where royalists drank confusion to liberty, poured out, followed by the National Guard, to Versailles, and brought the king and queen back to Paris. This destroyed all the moral authority and mysterious inviolability which had till then clothed the French monarchy. In 1790 the king promised to conform to a new liberal constitution, while Austria, Prussia, England, Spain, and Saxony allied against his rebellious people. In 1791 the king and queen tried to escape from Paris, but were taken, and the Constituent Assembly gave place to the Legislative Assembly, which met 1st October, 1791. At this time two great parties divided the revolutionists—the Girondins (q.v.) and the Jacobins (q.v.). The Austrians were now heard to be marching on F., and Paris broke out into mad fury. Henceforth until 1794 French history has to deal with two sets of events—with the repulse of the invaders, and with the violent struggles of factions in Paris. Each of 'the famous days of Paris' was prompted by the acts of the foreign enemies. On 10th August the Tuileries was stormed in reply to the atrocious threats of the royalist Duke of Brunswick. The taking of Verdun and Longwy by the Prussians provoked the September massacres, F. being declared a republic 25th September, 1792, and the loss of Cambrai led to the execution of Marie Antoinette. The king was guillotined on 21st January, 1793, and the treachery of Dumouriez and rebellion of La Vendée called forth the rising of 31st May, when supreme power passed over to the Jacobins, who won brilliant triumphs against the foreign enemy, and quelled insurrection at home, but, ignorant of ruling, and cruel through their fears and delusive hopes, plunged into the excesses of the Reign of Terror (q.v.), while the country yielded to them tamely, from its old habit of submitting to the crimes of the ancient regime. Reaction, however, swiftly set in. The leaders of the Jacobins fell, and the party broke up. (See DANTON, MARAT, HÉBERT, ROBESPIERRE, &c.) In 1795 the Convention made a new constitution, committing the executive power to a Directory (q.v.) of five. Then followed the dazzling campaigns of Napoleon, who on 13th December, 1799, overthrew the Directory and became Consul, and in 1804 Emperor of France. (See NAPOLEON.) After Napoleon's final downfall in 1815, the Bourbon Charles X. was restored by the allies. Under him the dishonesty, incapacity, and priestly intolerance of the old regime were revived, until the revolution of 1830 placed Louis Philippe, Duc d'Orleans, on the throne. His stubborn enmity to reform caused his abdication in 1848, and the establishment of a Republic. Louis Napoleon (q.v.) became president in 1848, and by the *coup d'état* of 1851 Emperor of F. The Napoleonic absolutism endured until in 1870 the Emperor declared war against Prussia, and after sustaining a series of the most crushing defeats recorded in history, surrendered with 90,000 men at Sedan, 2nd September, 1870. He was then deposed, and a Republic instituted at Paris, which city, after a resistance of four months, was entered by the Prussians, peace being made in March, 1871. F. ceded Alsace and Lorraine, and paid an indemnity of £200,000,000. The revolt of the Paris Communists was energetically suppressed by the government of Thiers, and a Conservative Republic was established. In 1873 Marshal Macmahon was chosen President for seven years; in 1879 Jules Grévy was elected, re-elected in 1885, and resigned in 1887, when Sadi Carnot was chosen as his successor. In June, 1894, he was assassinated, and Casimir Perier was elected in his place, but he resigned in January, 1895, when Felix Faure was appointed.

France, Isle of. See MAURITIUS.

Franche Com'té ('free county') was a province of the kingdom of France comprising part of the Jura mountains and the lowlands to the westward. It is now represented by the departments of Doubs, Haute Saône, and Jura. Originally possessed by the Celtic Sequani, it was conquered by the Burgundians in the 5th c., and after many changes was finally handed over to France by the treaty of Nymwegen in 1678.

Fran'chise, or **Lib'erty,** in English law, is a privilege by a grant from the Crown, or by prescription which by implication may also mean by grant. It may mean the privilege of corporation, exemption from special tribute, a right over land, as that of *forestry*, the right to vote for a member of Parliament or to hold a fair, the right to fish in certain waters, the right to maintain a park, a chase, or a warren, and so on.

Fran'cia, José Gaspar Rodriguez, popularly known as Dr. F., was born at Asuncion, Paraguay, about 1757. He was of French or Portuguese descent, studied for the Church, and took the degree of doctor of divinity at the University of Cordoba de Tucuman. Subsequently he left divinity for law, and gained a high reputation for ability, uprightness of conduct, and industry as a legal practitioner. The revolution among the S. American republics which made Paraguay independent brought F. to the front. In 1813 he was appointed joint-consul along with General Fulgencio Yegros; next year he was made dictator; and in 1817, such was the confidence of the Paraguayans in him, that he was appointed dictator for life, his death, looked upon as a great calamity, occurring 20th September, 1840. The most widely different accounts are given of this remarkable man. In a celebrated paper of Carlyle, reprinted in his *Miscellaneous Essays*, he is eulogised as a stern administrator of justice, while C. A. Washburn in his *History of Paraguay* (1871) paints him as an absolute tyrant. Unquestionably he did a great amount of good to Paraguay, promoted education, suppressed clerical abuses, encouraged agriculture, cattle-rearing, and every form of industry which he could naturalise in Paraguay, established defences against the Indians, and made injustice almost an impossibility. On the other hand, there can be little question that he was merciless towards those who plotted or were believed to have plotted against his life, and was bitterly opposed to the intermeddling or even the presence of foreigners—*e.g.*, Bonpland the naturalist, and the Swiss travellers Rengger and Longchamp, who published their experiences of him in an *Essai Historique*, &c. (1827). For a full and unfavourable account of F. see three vols. by J. P. and W. P. Robertson, two Scotchmen whom he expelled from Paraguay; *Letters on Paraguay* (1838); F.'s *Reign of Terror* (1839); and *Letters on S. America* (1843).

Fran'cis, St., of Assisi, the founder of the Franciscan order, and one of the most interesting and pure-spirited of Catholic devotees, was born at Assisi, near Naples, in 1182. He was the son of a rich merchant, Bernardone Mariconi, and was named *Il Francesco*, from his command of the Provençal speech. He was early noted for gaiety, kindness to the poor, and lavish splendour of living, the people of Assisi calling him 'the flower of youth.' Having been captured in a feud with Perugia, he was imprisoned for a year; and during this confinement and a subsequent illness at Spoleto, his ideas permanently changed; he resolved to devote himself to a life of worship and charity, abandoning in his twenty-fourth year all his worldly goods, becoming a hermit, and, in his own words, 'taking poverty as a bride.' He preached with loving fervour, wore the meanest dress, performed the lowliest offices to the poor and to the lepers in the hospital of Gubbio, and aided with his own hands in the building of St. Damian's church in Assisi. When as a preacher he visited the Umbrian villages, the people went joyfully to meet him with flags and green boughs and music. Gradually he was encircled by followers, whom in 1210 he formed into the Franciscan Order (q.v.), which was verbally approved of by Pope Innocent III. in the same year, though first confirmed by Honorius III. in 1223. The peculiarity of the order was its utter abnegation of personal property, the brethren disclaiming possession even of their robes and breviaries. The order increased rapidly, and in 1219 had 5000 members. F. likewise founded the orders of *Poor Clares* and of *Tertiaries*. About 1220 he visited the East to convert the Sultan Meledin, whom he induced to promise kinder treatment of Christian prisoners, and to grant the Franciscans the privilege of being guardians of the Holy Sepulchre. On 17th September, 1224, according to the Catholic legend, he received in a religious ecstasy on Monte Alverno the marks of the wounds of the Saviour. He died 4th October, 1226, having caused himself immediately before expiring to be laid on the bare ground of the church. St. F. is the most beautiful character in the history of mediæval Christianity—simple, childlike, and glowing with the purest emotion. His burning ardour was tempered by meek sympathies and undimmed by bigotry. Dante, who tells the story of his life, speaks of him as a 'splendour of cherubic light.' No one since the rise of Christianity brought religion so powerfully home to the people; his mystical raptures never lessened his yearning love for the poor. He completely changed monachism, transformed lonely ascetics into missionaries, and founded the most popular of all the orders. His *Canticle of the Sun*, written in artless Tuscan and thrilling with strange fervour, marks the rise of the lofty religious poetry of the Middle Ages which culminated in Dante. See St. Bonaventura's *Life of St. F.*; the Bollandist *Acta Sanctorum*; Chalippe's *Vie de St. F.* (1728); Chavin's *Vie de St. F.* (1841); Milman's *Latin Christianity*, vol. iv.; Vogt's *Der Heilige F. von Assisi* (Tüb. 1840); Hase's *F. von Assisi* (Leipz. 1856); and Stephen's *Ecclesiastical Biography*. Editions of F.'s works, which consist of letters, monastic treatises, parables, hymns, &c., are numerous. The most accurate is that of Père de la Haye (Par. 1641).

Francis, St., of Paula, born at Paula in the kingdom of Naples, 1416, was named after St. Francis d'Assisi, to whose intercession his parents believed they owed the birth of the child. Having manifested strong ascetic tendencies even as a child, he was sent at twelve years of age into the Franciscan monastery of St. Mark, in Calabria, where he surpassed all the friars in obedience to their *rule*. On the expiry of his year of probation, after making a pilgrimage with his parents to Rome and other holy places, he took up his abode in a cave on the sea-coast, and devoted himself to a life of extraordinary asceticism. The fame of his sanctity soon attracted to him a number of followers, who built for themselves a chapel and cell in the neighbourhood, and he gave to the new order he had thus founded the name of the Eremites of St. Francis. In 1436 the Archbishop of Cosenza sanctioned the building of a cloister and church, and monasteries of the new order soon sprang up in Spain, France, and Germany. In 1474 the *rule* was confirmed by Pope Sixtus IV., and Pope Alexander VI. changed the name of the order to Fratres Minimi. Louis XI. in his last illness summoned F. to France, where in a monastery at Plessis-le-Tours the saint died, 2nd April, 1507. He was canonised by Leo X. in 1519.

Francis, St., of Sales, a bishop and prince of Geneva was born at the château of Sales near Annecy, 21st August, 1567. He studied rhetoric, theology, and Hebrew in the College of the Jesuits at Paris, and law at Padua, passed advocate at Chambery, and was strongly pressed by his father to become a jurist. But his heart was set on a sacred career, and in 1593 he entered the priesthood. The fame which he won by his first sermons pointed him out as a fit missionary for the district of Chablais, then filled with Protestants. In spite of great opposition, the brilliant young Catholic made numerous conversions, and inspired the Pope with the belief that he might perhaps succeed in winning over Beza (q.v.) himself, then the leader of French Calvinism. Three ineffectual conferences were held in 1597. In 1602 F. visited Paris, preached before Henri IV., who greatly admired him, and signalised himself by the miraculous conversion of courtiers. In the same year he succeeded to the bishopric of Geneva, and in 1607 founded the Florimontane Academy, and published his *Introduction à la Vie Dévote*, a work which excited a prodigious interest, was translated into several languages, and in less than half a century had gone through forty editions. Next year he again visited Paris, where his pious oratory once more brought the city to his feet. Every distinguished person sought his friendship or acquaintance. Cardinal Retz begged him to become his coadjutor and successor, but nothing could induce the modest bishop to abandon his Alpine diocese. Between 1610 and 1614 F. established the orders of the Visitation of the Barnabites at Annecy, and of the Carthusians at Ripaille. Two years later appeared his famous *Traité de l'Amour de Dieu*, which may be said to have evoked the admiration of Christendom. He now thought of resigning his episcopal functions, and passing the remainder of his days in some calm retreat, when the Duke of Savoy required his services at Avignon. On his return he fell ill, and died at Lyon, 28th December, 1622. As a writer F. almost equals Montaigne in originality of style and the charm of diction. His *Œuvres Complètes* have been repeatedly published; the best edition is that of Blaise (16 vols. Par. 1835). F.'s letters in particular are exquisitely naïve and graceful. See Hamon's *Vie de Saint François de Sales* (Par. 1854).
